The CHAIRMAN. All right, we are ready for our questions. I will start off. I realize there is a cycle that develops. For so long, you have had a solid tax base with the oil and gas industry, now many of your communities are dealing with the fact that the tax base has been greatly reduced and jobs are hard to find, so it is a Catch 22 situation. To draw new industry, you have to beef up your existing infrastructure, yet you do not have the tax base to support that. What is your biggest challenge then, or first step, in breaking out of that cycle? What do you do?

Mr. FRITZ. Chairman Anderson, I think planning is the key. I realize what is happening, especially in the State of Texas with so much money needed for our school systems; I believe planning is the key because we can do things with long-term planning and a look to the future. If we look in our community, we build the infrastructure as an investment, jobs are going to come. That is sort of like the field of dreams, if we build it, they will come.

The CHAIRMAN. Well, I suppose I would like to hear more about your exchanges with potential new industries coming into the area. What kind of infrastructure shopping list are they coming in with? What do they want and what do you think they should have?

Mr. **Fritz**. Two things on the very top of our list are water and wastewater treatment. We feel that we have an advantage there, not only with the Guadalupe River and the San Marcos River coming into our area, but we have an enormous abundance of land, undeveloped land. We also have Carisa Wilcox Aquifer that can be tapped for water. It is a matter of making that investment and finding the funds to make that initial investment to make it happen.

Mr. **Amsler**. Mr. Chairman, I think the industries are looking for access to raw materials as well as markets. This area is uniquely suited in both of those areas. We have over seven million people within a two hour drive of this area, and obviously on the edges of this district you are right on the edges of those metropolitan areas. We have an abundance of raw materials and those that we don't have, with our transportation infrastructure that—as I indicated earlier, is good but needs improvement. We have the access to inexpensively get those raw materials in here to process.

We have presently a foreign trade zone which will allow us to process outside materials that are imported and re-export them which is a massive benefit. The Calhoun County industries, Formosa, Alcoa, BP and possibly Carbide are all going to be benefiting from that program and it will grow as others learn how to utilize it. It is brand new to this area.

We are seeing—as I indicated earlier, a tremendous desire to have the four land divided highway inexpensively move their trucks. That is a key.

In some of the situations that I have been involved in—and the steel mill that I mentioned earlier, they say they have to have the deeper and wider Victoria Barge Canal. We tend to utilize—you know, we have had this process going for—and Munson will tell you, many years. I do not—he knows how many we have been trying to get this project done and we have been funding it little by little—studies. And, you know, what I simply tell them is, you make a commitment to Victoria and we will figure out a way to do it faster. In the meantime, we ask you to carry on the process as quickly as it can possibly be done. But, you know, we try to take industry that is willing to make a commitment, if we can get something else done, and then push that. But, I think, you know, we have to recognize the weaknesses that we have and do our very best in the interim to improve all of those or any portion we can.

The **Chairman**. Greg.

Mr. **Laughlin**. Neil, I have been with you on at least one occasion where we visited with prospective new businesses to come to the region. I do not know if that is typical and I would like to ask you if in your conversations with prospective new businesses, how much interest do they express in our infrastructure and in our transportation that is available?

Mr. **Amsler**. I do not think I can overemphasize that. If I were to simply say that without what we have and what we might have, we would not be in the running at all. Transportation is probably—for the heavy industries anyway on our waterways, is the key issue. Without that, you have nothing.

Greg, on that trip we made to Taiwan, it started, in process, a program that has led to a study—just a few weeks ago, we have a

Taiwanese firm that has committed $150,000 to evaluate sites along the Gulf Coast for a project that we generated here in Victoria. I am chagrined to say that they do not think they ought to invest 2 or 300 million dollars, depending on how this thing turns out, without looking at other areas as well. Since we developed it here, we think it ought to come here. But, nonetheless, all the product will be exported to Taiwan. The access to the ocean going ports is critical to this project and, you know, I cannot emphasize enough how important our transportation infrastructure is.

The CHAIRMAN. What kind of transportation?

Mr. AMSLER. Water, highways, rail. We have an excellent rail system here. I could get real greedy and like to have two or three competing rail lines right up against each other coming into every site. That would give me a competitive advantage over most other areas. I guess I am realistic enough not to ask for that. But, you know, we have rail serving many excellent sites that are way above any kind of possible flooding, river, rain or hurricane surge tides. Unlike most coastal areas, we do not require pilings for our foundations. This is a cheap place to develop. We have an excellent environment. The permitting—aside from the Bureau of Reclamation and some of the problems they are causing for us, but permitting projects—up until the humongous Formosa project, has been routine. It has been real easy. We have got a work force in this area that is very trainable and highly productive and it is growing. You know, we literally have an excellent place to grow industry in the United States.

Mr. LAUGHLIN. Well, I knew from our experience, the Taiwanese, Chinese, were very interested in water transportation, but I wonder if that has been true in all of the other prospective businesses that have come and looked at the region. Are they interested in water transportation?

Mr. AMSLER. Now, you downstream industries that will occur because of the petro-chemical—like agriculture where—we grow so much agriculture, of all types, in Texas and most of the processing occurs out of state. To a lesser extent that occurs in the plastics industry as well. We create the basic plastics, the intermediate and finished product manufacturing has historically been done out of state. These products are sent out by water, they are sent out by rail, they are sent out by truck. But the downstream industry itself will almost exclusively use rail and truck and those systems have got to be adequate as well. And the distribution industries; we have competed on a number of occasions for distribution facilities and they always end up going on an interstate. You know, they have got it calculated down to the tenth of a cent per mile that they lose when they get on less than interstate quality highways. We cannot even compete for those kinds of industries without having four lane divided freeways going to all of the major metropolitan areas around us.

Mr. LAUGHLIN. Mr. Chairman, I would have been disappointed if John Fritz had not mentioned that hump at the Gonzales Airport because it is the only airport that I have ever landed in that has that situation existing. And while it is a real thrill, it is not one that the average airplane passenger wants to experience. It points out the problems that our rural communities are facing, when you have an airstrip like we have in Cuero that cannot expand. It was put there many, many years ago before we had any development that would cause people to use our municipal airports for anything other than entertainment flying. Certainly, the Gonzales Airport throws out another, what I almost perceive as a hazard, to general aviation trying to land or takeoff there. So, it does point out why we must look at our rural municipal airports and address these sort of problems if we are to expect rural America to survive. These two examples truly point out the importance of this hearing.

Carl, I have to ask you a question. The staff reminded me, and certainly your business ought to fit in. Either in September or October, this Committee will be sponsoring in Washington, DC a science fair dealing with the new and innovative technology for infrastructure. We have been in contact with the Texas Transportation Institute who is going to have some representatives and some displays there and it seems to me that the technology of your company certainly is on the frontier. It is new, it certainly appears to be a cost saving technology. If you are interested, I would appreciate you working with my staff, whom you have been working with in the past, but I would like to extend an invitation to you to participate in that, what will probably be a two day science fair for the infrastructure.

Mr. HUTCHINSON. Thanks, Greg. I was going to be in Baghdad then but I will change that. [Laughter.]

Mr. LAUGHLIN. It sounds like you are still in the reserves. If you are, I do not find much humor in that, since next week, I will be going on my active duty reserve. I hope the President lets those orders stand and does not divert them to Baghdad where I hope I do not see you. But if you will——

Mr. HUTCHINSON. Yes, sir.

Mr. LAUGHLIN. I appreciate that because your company and you have visited with me on prior occasions and I have seen the displays and the reports on how you are improving the environment by taking care of this waste product and actually saving money for our municipalities, our state agencies that are in highway construction. I think it would be a very important contribution from rural Texas to the science fair. So, I thank you for diverting your plans from Baghdad to be in Washington and we will work with you on the dates.

Thank you, Mr. Chairman.

The CHAIRMAN. Mel, do you have any questions?

Mr. HANCOCK. Well, let me just briefly say that my background is as a small businessman and I think under the circumstances, since we need to move this along like a business organization would have to operate, I think I am going to withhold them. I appreciate the testimony. I think it is moving and it is an excellent, excellent hearing and I am looking forward to the rest of it.

Mr. LAUGHLIN. Thank you, Mel, and thank all of you for being here.

The next will be the Highway Panel, Mr. Fred Jones, City Councilman, City of Port Lavaca and Mayor Leonard Lamar, City of Palacios.

Fred, if you will proceed.

TESTIMONY OF HON. FRED A. JONES, COUNCILMAN, CITY OF PORT LAVACA, TX AND HON. LEONARD LAMAR, MAYOR, CITY OF PALACIOS, TX

Mr. JONES. Thank you, Congressman, and, gentlemen, good morning.

Our purpose in testifying before you this morning is talk a little bit about Highway 35's inclusion in the Highway Trunk System. Our community has testified before the Highway Department Trunk System hearings on several occasions and we have been in touch with other elected officials, industries in other cities in our area along Highway 35. Each one of our council members was assigned a different group of these people to ask their support and we received considerable support regarding our inclusion.

Specifically, I would like to address my remarks to Highway 35's inclusion into the Highway Trunk System by reading you a letter that our mayor wrote to Mr. Dedman with the Texas Highway Department earlier this year.

> Highway 35 connecting the cities of Corpus Christi, Portland, Ingleside, Aransas Pass, Port Lavaca, Point Comfort, Palacios, Bay City, Angleton, Alvin, Pearland and Houston should be included in the Texas Highway Trunk System.
>
> This highway meets seven of the criteria established by the State at previous hearings:
>
> (1) It connects existing four-lane divided highways, I-37, State Highway 288 and Interstate 10.
>
> (2) It minimizes indirect routing for the industries and people along this coastal route who now journey 30 to 40 miles north to 59 or Highway 77. Moreover, it significantly improves our access from these coastal cities to Houston Hobby Airport, to Houston Medical Complex and the Astrodome.
>
> (3) It connects Houston's and Corpus Christi's ports with the major petrochemical industries located along the coast accessible largely by Highway 35 and serves the proposed 42 feet deep water port at Port Lavaca/Point Comfort.
>
> (4) It will serve the Homeport at Ingleside.
>
> (5) It connects the major tourism areas along the coast, including beaches at Rockport, Fulton, Magnolia, Matagorda and Port Lavaca. It provides access to the Aransas Wildlife Refuge and major fishing towns such as Rockport, Port O'Connor, Port Lavaca and Palacios. It also provides Texas with a coastal highway which will stimulate tourism between Corpus Christi and Galveston and provide improved transportation for winter Texans. I might add that we are a one and a half to a two hour drive from major population centers of Corpus Christi, San Antonio, Austin and Houston. So we are sort of in the hub.
>
> (6) It comprises a major truck route necessary to serve petrochemical facilities and the South Texas Project.
>
> (7) Highway 35 connects Corpus Christi and Houston with four cities of 20,000 in population, Pearland, Alvin, Bay City and Lake Jackson. It also ties in Angleton, with a population of 15,000, Port Lavaca, 14,000, Clute with 10,000 and Freeport with 12,000 to create a badly needed coastal highway.
>
> Access to the coast is severely limited because Highway 35 has only two lanes. Tourism sites along the coast are more difficult to reach because of poor access and some congestion due to truck traffic serving our local industries.
>
> We are aware that there is a great demand for inclusion of additional roads in the highway trunk system and we believe the proposal should be expanded to include Highway 35.

In light of what is stirring out in the Gulf right now at this particular point, we would also like to have Highway 35 considered as an additional evacuation route out of our area. Highway 87 presently to Victoria is the only way that we can get out normally during times of hurricanes and the last time we were evacuated, I was trapped in my car for four hours between Port Lavaca and Victoria with three children, which is normally a 25 minute drive.

Thank you.

Mr. **Laughlin**. Thank you, Fred.

Mayor Lamar, if you will proceed.

Mayor **Lamar**. Thank you very much and good morning. Chairman, I appreciate this opportunity to appear before you all.

My major purpose in being here today is directly because of the Port Lavaca Chamber of Commerce and the City Hall writing our Chamber of Commerce and myself a letter to support them in their efforts to try to get Highway 35 recognized in the trunk system. You each have a copy of a resolution that our Chamber of Commerce and our city government has passed. If you would like me to read them I would be glad to, or if you would like to enter them in the record—whichever one you choose.

Mr. **Laughlin**. We will enter them into the record and you can summarize your comments, Mayor.

Mayor **Lamar**. Well down in Palacios, we like to keep things short and simple and we just felt like Highway 35 got left out and we are along the coast there too—in fact, we are on the Bay. But we would offer any support we can to all the cities from Lavaca Port to Bay City, Port Lavaca and Point Comfort, they need some help real bad with the Formosa Plastics in there. If you have been by during construction phase, you know that they really have congestion there now and they are going to need some help on their highways.

Thank you.

[The resolutions referred to by Mayor Lamar follows:]

PALACIOS
Chamber of Commerce
The City By The Sea
P. O. Box 774 312 Main Palacios, Texas 77465 (512) 972-2615

RESOLUTION

WHEREAS, the upper central Gulf Coast area is expecting extreme growth during the next few years due to the 1.7 billion dollar expansion of Formosa Plastics USA in Point Comfort, and

WHEREAS, due to this project it will be absolutely imperative to have a good direct route from that plant to Houston and Corpus Christi such as an improved State Highway 35, and

WHEREAS, the highest capacity chemical dock in the United States which will include a container dock facility and a heavy lift dock is in the process of being constructed near that plant location, and

WHEREAS, State Highway 35 improvements are essential to attract other industries and businesses to the Gulf Coast area, and

WHEREAS, State Highway 35 is the only coastal highway from Houston south and this is extremely important to attract and retain tourism in Texas.

THEREFORE, be it resolved that the members of the Palacios Chamber of Commerce, hereby represented by their President and Vice-President, consider it absolutely essential that the improvements of State Highway 35 be included in future plans.

Jack Lesley, President

August 3, 1990

The Honorable Greg Laughlin
312 South Main St.
Victoria, Texas 77901

Dear Congressman Laughlin:

The Palacios Chamber of Commerce would like to submit the enclosed resolution to the public hearing on the future needs of our nations´ infrastructure which is scheduled on August 7 in Victoria.

We, respectfully, ask that you and the Public Works and Transportaion Committee consider this resolution regarding the improvement of our local highway system.

Sincerely,

Jack Wesley
President

RESOLUTION

On this the 2nd day of July, 1990, the City Council of Palacios, Texas, met in regular session and, among other proceedings, adopted this Resolution joining Port Lavaca and other cities and towns along the "Coastal Connection" in encouraging the State Department of Highways and Public Transportation to remember all of us when they are finalizing the plans for the Texas Trunk System.

PASSED AND APPROVED on this the 2nd day of July, 1990.

Voting for the Resolution: Neil Hartsfield, Don Kopecky, Chris Woll, Joanna Hendricks, and Lucy Mata.

Voting against the Resolution: None

Absent and not voting: None

Leonard Lamar

Leonard Lamar, Mayor

ATTEST:

Lin L. Pitrisky

City Secretary

Mr. LAUGHLIN. Mr. Webster, did you want to make a statement?

Mr. WEBSTER. Yes. I would like to read a portion of a letter from Formosa Plastics Corporation.

> I would like to express our support on the importance of establishing Texas State Highway 35 in the proposed Texas State Highway Trunk System.
>
> As you are probably aware, due to Formosa Plastics' $1.5 billion expansion project in Calhoun County, Calhoun County is experiencing and will continue to experience a substantial degree of growth over the next two to three years. As progress is made on the new complex and even more so as the growth is realized on a permanent basis, we feel that it is vital that the direct route between Houston and Corpus Christi be approved.

This is from Jack Wu of the Formosa Plastics Corporation of Texas.

I would like to further extend that. One of the criteria that was not included in the State Highway Trunk System was the criteria for the movement of hazardous materials, and that is a major issue to the people in Calhoun County. There are five major petrochemical or other industries there that do move a lot of hazardous materials. Much of that goes out by water, but the link to Houston and Corpus is essential to us. And right now we have a two-lane road on which we move some hazardous materials along with a lot of tourists and other things happening up and down that roadway. That is a major concern to all of us, is how we transport the hazardous materials.

Mr. LAUGHLIN. Thank you.

The CHAIRMAN. Is that all of them?

Mr. LAUGHLIN. I have some questions.

The CHAIRMAN. Okay, I have a question or two possibly.

Although your comments were more specific to highways, I would like to take advantage of you also being elected officials. What do you sense the public reaction to these and other infrastructure needs to be on a grassroots level, are they accepting these as a high priority?

Mr. JONES. Yes, Mr. Chairman, they are. Each member of our City Council was assigned a different group of people to contact, to solicit their opinions and information and support. We received considerable support from all those people considering—particularly I guess one of the major concerns was our evacuation route out of our area during times of bad storms. Also the carrying of hazardous materials by some of our industries is a big concern, although a lot of those companies take care of their hazardous materials in a very effective manner.

We feel like we have an awful lot to offer in our area and the people of our community would like to see more access to our area from the major population areas that I mentioned, from Corpus Christi all the way around in a semi-circle to Houston. We think that four-lane highway system would be of great economic benefit to our area.

The CHAIRMAN. Again, I would like to return to my question of what new industry is looking for when they consider locating in your area. Are you finding that your highway and bridge system is adequate to their needs? And I am looking beyond the interstate system to local streets and bridge problems.

Mr. Jones. Well I have a comment, but I would like Mr. Webster to answer that question since he is our City Manager. One of the things that we are looking for definitely in our community is housing.

Mr. Webster. As a comment, I think that our city particularly has put a lot of dollars into our local systems; into our local streets and major thoroughfares. That has been a big issue to us. The biggest problem for us though is access from other locations, particularly Houston, Corpus, and as has been expressed Victoria. From Victoria to us is a connection to Austin and ultimately up to Dallas. So the highway system is very critical to us. Of course I think we have done a good job with the state's assistance also, in improving our port there at Point Comfort. That has been a major issue in the development of industry in our area, has been the water access.

Mr. Laughlin. Mr. Chairman, I should point out that not only does Highway 35 run through the cities of Palacios and Port Lavaca, who are represented here; it runs through Bay City and I see the Mayor of Bay City here in the audience. I might, for your information, tell you that that is the town where I was born because there is no hospital in West Columbia, another problem we face in rural America, and it runs through the town where my parents have lived since before my birth, and their house is exactly one block from Highway 35.

David, when you were in my office a couple of weeks ago, I had not driven Highway 35 from West Columbia to Bay City at rush hour in some time. Rush hour is when Phillips 66 plant on Highway 35 at Old Ocean, called the Sweeney Refinery, turns loose. There is substantial construction expansion of the petrochemical plant there taking place and it is a dangerous situation out there because Highway 35 between West Columbia and Old Ocean is very narrow. From Old Ocean to Bay City, while it is a little wider, we had a very tragic death out there two years ago in broad daylight. There was not any drinking or was not any speeding involved. It is just a narrow highway and two cars hit head-on and a lady that I have known all my life was killed in the middle of the afternoon with no weather being a problem. It is just a narrow highway and it points out that we have got tremendous needs for Highway 35 because you go from the Sweeney Refinery at Old Ocean, where there is tremendous expansion taking place; then you come to Bay City that is sort of a hub along that area, and between Bay City and Palacios, we have the Texas Nuclear Plant, which had a tremendous number of workers while it was under construction. You get from Palacios to Port Lavaca where Formosa Plastics is expanding the work force there, and it points out to me that all this is a two-lane highway and I compliment the Mayor and City Manager and City Councilman for coming to bring these issues to the Committee's attention because often I can sit there and talk about these things and some of my fellow committee members say "Well, Greg, that is in your home town area and you are trying to take care of that." So it is helpful to have the kind of input that you have given, showing that the needs and the use are there, and also the more important factor and that is the safety, not only during what I call rush hour, but when we have the hurricane season that we are in the middle of now.

So I thank each of you for highlighting those highway needs there.

The CHAIRMAN. Mel.

Mr. HANCOCK. I have no statement, Mr. Chairman.

Mr. LAUGHLIN. I thank each of you very much.

Mr. HANCOCK. I think Mr. Lamar has a statement.

Mayor LAMAR. I just wanted to make one more comment about that. The highway system, Highway 35 from Bay City to Palacios, the county commissioners in the past, many years ago, had the foresight to see that the Highway Department acquired enough right-of-way so we could have a four-lane. So it is not going to be a problem about acquiring additional land. We have this all the way to the county line. So that is a big advantage and I hope the present commissioners keep pursuing this, because if you want to go to Palacios, you have to want to go there to go down Highway 35, we are off in a corner and we have a bypass that goes from Blessing over to Highway 35 that we are fighting real hard to keep that as a farm-to-market road and keep Highway 35 as a trunk line.

Mr. LAUGHLIN. Mr. Chairman, while the Mayor says it is off in a corner, my last two years in high school, the Mayor's home town out-scored mine in football games and I have never forgotten it. [Laughter.]

Mayor LAMAR. Well I am new to Palacios, I went down there 15 years, but every town I go to—apparently that one year Palacios tore up everybody.

Mr. LAUGHLIN. They did.

Mayor LAMAR. That is what everybody remembers.

The CHAIRMAN. The reason I kept asking my kind of question about what the local communities thought their infrastructure needs were, is because I find that a lot of local communities do not recognize what the little thing is that is not getting companies and things to come in. And I will try to make this as brief as I can, I do not know of any place in the country that is worse than my own District.

I come from the Ports of Los Angeles and Long Beach, and I have not been there that long, but I noted everybody was sort of satisfied with the way things were and did not want to do any changes and the Port of Los Angeles channel depth was 15 feet. Now you know that any container vessel has to have at least 45 feet or it cannot get in. Yet, that did not seem to bother anybody. We were 15 feet, we did not have any good access down there from several ways, and yet we did receive—I might say the thing that shocked me was I went out one day, and I know when container ships would want to come in and they had something that had to be delivered to Los Angeles, they could not unload it, they would take it up to Oakland or down to San Diego and unload it and then bring it in by train or truck or something. And that is the way things were done.

Finally, we decided to deepen the port channel and that was one of my first projects. And we deepened it and all of a sudden ships started coming in there that had not come in before. But then we found we did not have other kinds of things to haul it out. We had to then get access into the port so that we could get things taken out.

One thing brings on another. Deepening the channel brought in water transportation; then we had to get highways for truck transportation; then we found that people—everybody else in there, one person to a car, decided to get on that same highway and congested it. And now the little interstate that I brought into my two ports was identified a few years ago as the most highly traveled section of interstate in the Nation. And about two months ago, I had seven of my people who are in the transportation business from Los Angeles Port and Long Beach Port, they met with me to let me know that things are bad now because we have got so much traffic on that strip that now the trucks cannot take the stuff in. We have now got to build transit lines to get the people out of their cars so the trucks can have more access. He says in the old days we could get to downtown in roughly an hour. When we built the freeway, they could get down there in 30–40 minutes. Now with the congestion, it takes two and a half hours. And they said we pay our truck drivers $25.00 an hour and that has to be added onto the cost of the product we are selling and that is why we cannot compete.

So you see all these little things—you may not know it, but because of what we have done in that area, we took these two ports that were not doing much business some years ago and New York-New Jersey was then the number one port complex in the Nation; now the Los Angeles-Long Beach Port complex is number one and we are making money. We made a billion dollars a year for the last six years for the federal government in just customs alone, which paid many times for everything we have spent down there. We do have a deep channel, we do have access in, but it does not mean that you are through because there is always something.

Also, we wanted to get a world trade center; we have been fighting for that for 20 years. Finally, we decided where to put it and then we figured well maybe a little 9–10 story building. Then before we even got it started it was completely filled, all the space, so we went up to 12, 14, 16 stories, it keeps growing. It is now 29 or 30—anyway it is way up. But on top of that it is already full and now we are starting a second one across the street because there is so much business that has come in that has taken it up in the port complex and there is no access.

So there are these kinds of things. I do not know what your area is like—I mean the other day we were talking about deepening channels, you know, and that is why I was asking what kind of things you people were interested in and what kind of infrastructure you really are talking about when you meet with some of these industrial people.

I am sorry I took so long.

Mr. LAUGHLIN. The next panel, Mr. Chairman, will be the waterways panel; Mr. Dennis Simons, Chairman of the Jackson County River Authority in Edna, accompanied by Ralph Burgess, General Manager of the Jackson County River Authority; Mr. Emmett Gloyna, General Manager of the Lavaca/Navidad River Authority in Edna; Mr. Munson Smith, Executive Director, Victoria Navigation District accompanied by Chairman of the Navigation District

David Engles and Mr. Eli Mayfield from the Palacios Navigation District, Palacios.

Dennis, we will start with you first.

TESTIMONY OF DENNIS S. SIMONS, CHAIRMAN, JACKSON COUNTY NAVIGATION DISTRICT, EDNA, TX, ACCOMPANIED BY RALPH BURGESS, GENERAL MANAGER, JACKSON COUNTY RIVER AUTHORITY; EMMETT GLOYNA, GENERAL MANAGER, LAVACA/NAVIDAD RIVER AUTHORITY, EDNA, TX; MUNSON SMITH, EXECUTIVE DIRECTOR, VICTORIA NAVIGATION DISTRICT, VICTORIA, TX; AND ELI MAYFIELD, PALACIOS NAVIGATION DISTRICT, PALACIOS, TX

Mr. SIMONS. Mr. Chairman, Congressman Hancock, Congressman Laughlin, I am Dennis Simons and I am Chairman of the Jackson County Navigation District. There was a mistake on the agenda, we are not the River Authority but we are the Navigation District of the County.

I would first like to thank all of you and your staffs for taking the time out of your busy schedules to come here today and hear the concerns of our district.

The Red Bluff Channel is an authorized U.S. Corps of Engineers project. It is 20.2 miles long and has authorized dimension of six feet in depth and 100 feet in width. It is a tributary channel to the 12 foot by 125 foot Port Lavaca Channel, through which it has access to the deep draft Matagorda Ship Channel and the Gulf Intracoastal Waterway. The river portion of the channel has not had maintenance dredging performed on it since about 1962 and the Lavaca Bay segment since 1981. Portions of the channel are as shallow as 18 inches, making the channel impassable anything larger than small pleasure boats.

There are several large industrial sites located along the river portion of the channel with access to rail and highway transportation, abundant natural gas and electrical power. In addition to these, the sites also have direct access to a freshwater pipeline running from Lake Texana, one of the largest available and uncommitted freshwater supplies along the Texas Gulf Coast. These sites are also in near proximity to the Formosa Plastic Company plant, which is currently undergoing a $1.3 billion expansion. The only thing that seems to be hampering our county's ability to take advantage of any spin-off companies resulting from the Formosa plant is the current condition of the Red Bluff channel.

In previous contacts with industries, the Economic Development Board has been told that the sites have all necessary amenities, with the exception of water transportation.

The 1990 federal budget included the sum of $250,000 for maintenance dredging of the channel. In the corps estimate, however, an additional $400,000 is needed in the 1991 budget in order that the project can be completed. The corps has prepared plans and specifications for a portion of the project, although bids have not been awarded as of this time.

This past March, Ralph Burgess and myself appeared before both the House and Senate Appropriations Subcommittees for Energy and Water Development asking that this additional $400,000 be included in the fiscal year 1991 budget. The House version of the Appropriations bill included the full funding that we asked for. However, on the Senate side, the entire amount was deleted in Subcommittee and we do not expect it to be in the Senate version of the bill. Our only hope now to get the funds necessary to complete the project seems to be in the compromise committee that will work out the final version of the bill.

We are here today to bring to the attention of the members of this Committee the need to have this project funded and ask for your help in seeing that the funds are placed back in the final version of the appropriations bill. By giving the Corps of Engineers the full amount needed, the contract for the entire project could be awarded in one package and result in a savings in the overall cost.

Thank you.

Mr. LAUGHLIN. Thank you, Dennis.

Emmett, if you would proceed.

Mr. GLOYNA. Mr. Chairman, Congressman Laughlin, Congressman Hancock, my name is Emmett Gloyna, I appear today on behalf of the Lavaca-Navidad River Authority, of which I serve as General Manager. Accompanying me is also Mr. M.H. "Buddy" Brock, the President of L-NRA's Board of Directors. We too would like to welcome you to our area and thank you for convening the hearing in Victoria.

The L-NRA is a subdivision of the State of Texas created by the Texas Legislature in 1959 to develop the waters of the Lavaca-Navidad River system.

We wish to discuss with you today a unique infrastructure problem that we have. In 1968, Congress authorized the construction, operation and maintenance of the Palmetto Bend Project. A year earlier, Jackson County voters authorized the Authority to issue bonds to meet the Authority's financial obligations incurred with the construction of the project. The project provides water for municipal and industrial purposes at a firm annual yield of 75,000 acre feet. It also provides recreational fish and wildlife facilities. In 1974, project opponents challenged the project under the National Environmental Policy Act. The Federal District Court for Victoria upheld the project and reservoir construction was completed for Lake Texana in 1980.

In 1981, the Authority constructed a 36-inch pipeline to supply freshwater from lake Texana to customers near the Texas coast. This pipeline crosses federal land below the reservoir. In 1989, the Authority proposed to construct another line along the same general route to transport additional water from Lake Texana. Proceeds from the sale of this water will be used to repay the United States a portion of the cost of the Palmetto Bend Project. Because the authority's operation and maintenance costs are currently met by a local property tax levy, sale of the water from Lake Texana will produce a direct benefit for local residents by reduction of their property taxes. Additionally, by sale of this water, the Authority can assume the obligation as a state for repayment of project costs, as was anticipated at the time of construction. Having this additional large capacity pipeline will enable the Authority to market water to municipalities and industries in the Gulf Coastal Bend area. The Authority already has a firm contract for sale of the water to commence upon completion of the pipeline. And finally we can then begin to repay the debt to the federal government.

So far, this is a rosy picture. The federal government has provided substantial, welcome assistance in this area. Without development of dependable surface water supplies, industry cannot be attracted. We have a poor economy but a large labor force. Our population can well service industrial facilities in our area and will benefit greatly from new jobs. Additionally, in the future the municipalities of this area will very much need dependable surface water supplies. The City of Corpus Christi, for example, today is in great need of additional firm water supplies. The Authority now has a customer whose obligation to purchase water will enable the Authority to significantly reduce its current tax levy. The Authority will now finally be able to repay its payment obligation to the United States as well as that of the state.

But our future is not as pleasant as all this sounds. Just weeks before we anticipated receipt of the permit for our pipeline across federal project lands, and at the urging of the U.S. Fish & Wildlife Service, the Bureau of Reclamation suddenly announced it was looking into whether to prepare an environmental impact statement on the 2,000 feet of pipeline crossing and the approval of the River Authority assuming the state's obligation to replay these funds. The justification we are given is that our customer, Formosa Plastic Corporation, may and only may, have environmental impacts.

Mr. Chairman, we are not here asking for appropriations. We want only to be set free to proceed with construction of our pipeline so we can honor our obligations to the United States for repayment of money it has already spent pursuant to Congressional authorization. We have no way to fulfill the project's purposes as set out by Congress by sale of the water until we can deliver with a pipeline which must cross about 2,000 feet of federal land.

There is no environmental impact on this pipeline. All agencies—and there have been many at the state and federal level which have reviewed this project—have reached that conclusion. The federal district court which examined the project, and the project has not changed since that time, concluded that the environmental impacts have been adequately assessed prior to project construction. Nothing has changed. What has happened is that one of our proposed customers has aroused the ire of several federal fish agencies.

We are therefore being held hostage and this means we must either tax our residents for something we should be able to get someone else to pay for if we only had a pipeline to deliver water, or we cannot repay the government. I appear today, not to ask for money again, but to urge that the Authority be permitted to proceed with construction of its pipeline so it can deliver water and repay money Congress has spent for the project.

Thank you for inviting us to appear.

Mr. LAUGHLIN. Thank you, Emmett.

Munson, if you will proceed at this time.

Mr. SMITH. Thank you, Chairman Anderson, Congressman Hancock and Laughlin. We appreciate the opportunity of being here.

We appreciate you providing a forum to hear our concerns here with regard to the infrastructure needs in our community.

I am legal counsel for the Victoria County Navigation District and the West Side Calhoun County Navigation District. The Victoria County Navigation District is a countywide district. The West Side Calhoun County Navigation District is comprised of the most western part of Calhoun County. These navigation districts are charged with the responsibility for promoting navigation within their respective districts and recognize the importance of the use made of navigable waters in this area of the Gulf coast by the industrial, agricultural, mining and fishing industries.

The two navigation districts act as joint sponsors of the Victoria Barge Canal. They represented the local interests in the construction of the canal which was commenced in 1951 and completed in 1965. The Victoria Barge Canal is a shallow draft channel, nine feet deep and with a bottom width of 100 feet. The channel extends approximately 35 miles from the Gulf Intracoastal Waterway in San Antonio Bay in Calhoun County northward to its terminus at the Pickering Basin in Victoria County located approximately seven and a half miles south of the City of Victoria, Texas. The canal, therefore, acts as a tributary channel of the Gulf Intracoastal Waterway.

The GIWW and its tributary channel to Victoria played a significant role in the economic development of both Calhoun and Victoria Counties. Union Carbide Chemicals and Plastics Company; the Carbon/Graphite Group; B P Chemicals Company and E.I. duPont De Nemours Company have located industrial plants along the channel. To illustrate their importance to the area, the Union Carbide, Carbon/Graphite and B P Chemicals properties contribute 38 percent of Calhoun County's entire 1990 certified tax base.

The duPont plant which employs some 1250 permanent employees, and the sand and gravel producers in Victoria County, contribute significantly to the traffic on the Victoria Barge Canal which consist principally of sand and gravel and petrochemicals. About 2,500 barges per year carry over 3½ million tons of waterborne traffic on the canal each year. Over 97 percent of all sand and gravel on the western portion of the Gulf Intracoastal Waterway originates in Victoria and over 41 percent of the basic chemicals on the Gulf Intracoastal Waterway moving between Galveston and Corpus Christi are shipped on the Victoria Barge Canal.

I am sure that I do not have to recite statistics to this Committee to point up the importance of the Gulf Intracoastal Waterway System to this nation, and in particular to those states bordering the Gulf of Mexico. This waterway system, promoted by the Gulf Intracoastal Canal Association, was organized in Victoria, Texas in 1905. It was constructed as a 12-foot deep, 125-foot channel extending over 1,100 miles from Florida to Mexico under a series of congressional acts from 1925 to 1942. It connects all the deep water ports and the inland rivers and waterways along the entire Gulf Coast. It was originally projected to carry about five million tons of commerce without any recreational benefits. It now carries over 100 million tons of commerce and is used by two million recreational boat trips per year. The State Department of Highways and Public Transportation, which acts as local interests sponsor for the

426 mile portion of the GIWW located in the State of Texas, reports in a recent report on the Gulf Intracoastal Waterway in Texas, that the waterway in Texas alone carries about 75 million tons of commodities valued at over $20 billion each year. It is also vitally important to our fishing and shrimping industry. Studies have shown that the GIWW returns $26.00 each year in savings and transportation costs for each $1.00 spent by the government on construction, maintenance and operation of the waterway.

A report on the economic impact of the GIWW system in Texas, prepared in April, 1989, for the Sea Grant College Program at Texas A&M University, states that the GIWW provides jobs for about 150,000 Texans, either directly employed by water transportation companies or by industries that are heavily dependent on water transportation. The sport and commercial fishing and recreational activities create an additional 48,000 jobs statewide. All of these jobs contribute up to $675 million in state personal income. It has been estimated that approximately 20 percent of the Texas state gross product is linked to water transportation. Almost three-fourths of Texas goods are shipped by water. Benefits are derived from lower cost, more efficient shipment of goods by water. Moving commodities by barge reduces transportation costs substantially. The cost of moving chemicals by rail or truck is about six to seven times greater than moving them by barge. These significant cost savings are responsible for the heavy concentration of chemical plants and manufacturing establishments along the Gulf coast.

We are experiencing several serious problems which could greatly impact the GIWW. Erosion of the Gulf shoreline and environmental problems related to open bay disposal areas present problems to the continued maintenance of the waterway. One stretch of the Gulf Intracoastal Waterway in Matagorda County near Sargent is threatened to be breached by intrusion of the Gulf of Mexico if the shoreline continues to recede at the rate that it is presently receding. We must achieve a more appropriate balance between environmental interests in the removal and disposal of dredged material and the commercial and economic benefits derived from the proper maintenance of the GIWW and its tributary channels. If the GIWW became inoperable in Texas, it would have a devastating effect on our economy and on the inland transportation system of our country.

The present depth and width of the tributary channel to Victoria affects the efficient use of the canal and is a concern with regard to the safety of the barge tows using the channel. Approximately 14 years ago, the two navigation districts, as local sponsors, requested the modification of the channel to cause the specifications of the channel to be brought into conformity with those currently existing on the Gulf Intracoastal Waterway. The proposed project has been found to have a 1.2 to 1 benefit to cost ratio and has been approved by the U.S. Corps of Engineers and the construction authorized by the Water Resources Development Act of 1988. Annual average benefits to be derived from the improved channel are estimated at $2.9 million. The proposed modifications to the channel can be accomplished in such a way as to be beneficially effective for use for navigation while protecting and enhancing the environmentally sensitive areas involved in or affected by the project. The Corps of

Engineers, Galveston District, is presently working on the general design memorandum for the project and expects to have the memorandum completed in October, 1990. Hopefully, this Committee will recommend the appropriation of funds for the widening and deepening of the channel during the next fiscal year. Total cost of the project is expected to be about $24 million with the local or non-federal share being about $8.8 million. Of this amount, $1.7 million will be the local interests' share of construction costs and the balance primarily spent for new upland disposal areas and their associated levees and spillways. The improvement of the Victoria Channel is needed to provide for the more efficient and safer use of the channel. If the channel is not modified, it could conceivably become obsolete. A railroad spur to the Pickering Basin from the Union Pacific main line was completed in early 1989 by the Victoria County Navigation District, thus providing three major modes of transportation to serve the users of the barge canal; the highway, waterway and the railroad. The Navigation District owns about 350 acres at the Pickering Basin and leases the property to long-term tenants that make use of the canal. The railroad spur should enhance the development of the turning basin and the canal.

The Navigation Districts are also involved as a sponsor of the foreign trade zone to promote development of the barge canal and other areas within Calhoun and Victoria Counties. This project, together with the navigation projects sponsored by the navigation districts, should have a direct impact on Victoria and Calhoun Counties by increasing our tax base and providing jobs for thousands of skilled and unskilled employees.

The local navigation districts pledge their cooperation and assistance in addressing and resolving the infrastructure problems in this area. Their record of achievements show that they are aware of their responsibility to provide efficient and economic means of transportation which are so necessary to the utilization and development of the agricultural, industrial and commercial resources that are available to us in this region.

In closing, I have several videotapes; one produced by the Victoria County Navigation District which is the story about the Victoria Barge Canal and I think is rather graphic in presenting to you the scope of our project, our navigation project, entitled "Movin". I will leave this tape with you.

Mr. LAUGHLIN. Mr. Chairman, I would ask unanimous consent that the videotape that Mr. Munson Smith has brought today, be made a part of the file.

Thank you, Mr. Chairman.

Mr. SMITH. The other videotape is a tape that was produced for the Gulf Intracoastal Waterway Association entitled "Divided Waters-The Connecting Link". I think it is an excellent presentation of the Gulf Intracoastal Waterway and it points up its importance and some of its problems. And I will leave that with you.

Mr. LAUGHLIN. Mr. Chairman, I would also ask that the videotape of the Gulf Intracoastal Waterway system be made a part of the file.

The CHAIRMAN. No objection, so ordered.

Mr. LAUGHLIN. Thank you.

Mr. SMITH. Thank you very much.

Mr. **Laughlin**. Thank you, Munson.

Eli, we will hear from you at this time.

Mr. **Mayfield**. Thank you, Congressman. Mr. Chairman, Congressman Hancock, our own Congressman Greg Laughlin, since I am on the tail end of this panel, I would like to especially thank and express my appreciation and the community's appreciation for the Committee taking its valuable time, really its important time because I understand Congress is in recess, to come down and listen to the requests and problems of the transportation industries and water industries along the Texas Gulf coast.

We on the Texas Gulf coast have similar problems and divergent problems and advantages as does the Chairman have on the west coast of the United States insofar as water transportation is concerned.

I would like to first reiterate and express my sentiments that I approve of all the statements and remarks that Dennis Simons made, representing a river authority in the State of Texas. It was my pleasure for many years to sit as Chairman of a Board of River Authority in the state and I would like to repeat and reiterate the requests and statements that Emmett Gloyna made concerning the river authority in Jackson County. Mr. Gloyna has for many years been an admirable servant of the public in serving river authorities and water resource organizations throughout the state and nation. Munson Smith is a personal friend of mine and represents the navigation districts that you heard him announce to you.

It has been my pleasure after many years of attempting to work with water resources to now represent Matagorda County Navigation District Number 1, which is located in Matagorda County. We serve most of Matagorda County all the way from about the Colorado River to the Jackson County line.

In our little port, Mr. Chairman, our principal industry at this time is serving approximately 350 fishing trawlers. Those fishing trawlers are engaged in an admirable occupation of trying to provide for us shrimp and fresh fish and so forth. As most of you know, I am sure from reading the press accounts, those people who are engaged in the fishing industries are facing almost insurmountable problems with regulations that they are having to live under now in harvesting fish.

Our navigation district really, so far as I know, has no real difficult problems with infrastructure acquisition or repair and/or with maintenance, but we certainly, our navigation district, certainly hopes and desires that you, the Committee who are charged with these things, and with our Congress supporting you, will certainly provide and authorize the maintenance funds that are required for maintaining our shallow draft channel in Palacios, Texas, which is a tributary channel of the Gulf Intracoastal Waterway. We do have one turning basin, a third turning basin, that under the present laws and regulations, maintenance is not provided by federal funds, so we are relegated or resolved to providing our own maintenance. We can do that, our navigation district has the resources and funds to provide the needed maintenance for the third turning basin.

We would especially point out to you—I would as Munson Smith did—the study that we hope your Committee will give and we hope Congress will give too in remedying the bad situation that exists in

Matagorda County along the Sargent Beach area where the Gulf waters are about to cut through the intracoastal canal and destroy our shipping in the intracoastal waterway.

Again I would like to express my thanks to you, Mr. Chairman, and to the Committee as a whole for being present at this regional meeting and we appreciate your efforts in being here.

Thank, you, very much.

The CHAIRMAN. Okay, I guess we are ready for questions.

I suppose a question I have in mind relates more specifically to Victoria, but certainly with general applications to all of you. When the Victoria channel is widened and deepened, what changes do you foresee in this area in terms of economics?

Mr. SMITH. Mr. Chairman, we have determined that the widening and deepening is essential to not only bring in new industry, but to allow the more efficient and safer use of the channel by the current users of the channel. Presently, as someone alluded to earlier, the present users are having to light load their barges. In some instances they load them twice, they load them here in the barge canal and then when they get down into the Gulf Intracoastal Waterway in Calhoun County, they have trucked additional product there and they load them the remainder of the capacity of the barge. It is causing them to be less efficient in cost-savings in the transportation of those products. It is allowing them, in some instances, to lose expansion possibilities within their own plant facilities to other plants in other parts of the country that are more competitive in that regard. We think that it will not only increase the use of the channel by the current users, but bring in additional industry.

The CHAIRMAN. That could mean lots more business, lots more jobs and lots more money for this general area.

Mr. SMITH. Yes, sir, it certainly could. I think that the fact that we have had the major industry locate on the channel that we have had so far indicates that that is a definite possibility. There are all types of elements of industrial site—that industrial site locators look for that are available in this community. I think that the waterway is only a part of it, but an essential part of it. Some of the industry that has located here has done so only on our assurance that the navigation districts will diligently pursue the widening and deepening. Of course, we cannot cause it to happen, but we can do whatever the local interests can do to further it.

The CHAIRMAN. What has been the single most difficult obstacle to bringing this about?

Mr. SMITH. The endless studies that apparently have to be made in order to cause a project like this to be completed. We have been 14 years in the congressional process and through the study process with the Corps of Engineers. When we first got into this, the Corps of Engineers informed the navigation districts that it was a nine year process and we all were aghast at the fact that it was going to take us nine years to deepen the channel three feet and widen it 25 feet. It has been 14 years and when people ask me now what the status of our project is, I say we are 14 years into a nine year project.

I understand the environmental concerns that have to be addressed, I appreciate that, no one is more interested in the environment than I am, the valid environmental concerns. However, these processes take time and I think that that has been our biggest problem. It certainly has not been the lack of local support. I will say that in Calhoun and Victoria Counties, as evidenced from the fact that the Gulf Intracoastal Waterway was established here, there is a very strong desire by these people to promote navigation.

The CHAIRMAN. Greg.

Mr. LAUGHLIN. Thank you, Mr. Chairman, and I would point out, toward the end of this hearing, the importance of citizens like yourself coming before this Committee. Back in the spring time, someone—and I have not forgotten who it was—from the 14th District appeared before the Water Resources Subcommittee of this full Committee and made mention that one of the problems we were having in Texas, Louisiana and the western Gulf area was the fact that there was no citizen of our great country sitting on the Inland Water Use Board. And within the next day or so, the Assistant Secretary of the Army, Robert Page, appeared before our Water Resources Subcommittee and when I made mention of that to him, to lend some support—I thought it would be coming forward because Secretary Page is a Texan, and I might note he is a graduate of Texas A&M, so I really was expecting his assistance, and he made a commitment that we should have representation and through the efforts of the Water Resources Subcommittee and the assistance of Secretary Page, Burton Lawrence of the Hollywood Marine Company, a user of the Victoria Barge Canal, the Gulf Intracoastal Waterway system, has been nominated as the next replacement member on the Inland Water Commission. And that is a tremendous boost to our having our views heard by the Inland Water Board because there were no representatives on that Commission west of the Mississippi River unless you count the representative from Seattle, which technically is west of the Mississippi River, but who does not speak very often in support of Texas and Louisiana and Gulf Coast interests. So I point that out as one of the important benefits of having the interest that all of you have shown.

I would, Dennis, like to ask you if you could give us examples of the loss of business opportunities that Jackson County has suffered and this region has suffered because you have the Red Bluff Canal, which has been there for a number of years but has not had maintenance since 1960 or 1961. If you could give us some idea of the importance of this canal to the region.

Mr. SIMONS. Over I guess the past two years, we have had several inquiries, mainly through Ralph who is also chairman of our Economic Development Board, by companies or representatives of companies looking for sites along the Gulf coast for plants, basically petrochemical plants. And they would furnish us with a list of their needs for the site. The sites that we have have every basic need that they desired plus probably some that they would never have even thought of. They are excellent sites with the exception of water transportation. The sites are on the channel, but the channel is completely inaccessible now and as soon as the companies found out there was no water transportation and even though we would tell them we were in the process of having something done about that, we would hear no more from them. So it has hurt us and I think it has hurt the whole area because of that.

We do not want to take anything away from the Victoria Barge Canal by any means, but I think any development along the Red Bluff Channel would also be an economic boom also to Victoria County and the surrounding counties. The whole area benefits from any type of development in the area.

Mr. LAUGHLIN. Mr. Chairman, I think the important thing from the testimony that Dennis and Ralph have given before the Appropriations Committee and for this Committee to take back to Washington, is the fact that this canal exists. It has just been neglected by our government in Washington, DC, and through the efforts of many people in Jackson County and in particular Dennis and Ralph have come up two years in a row to testify. The House Appropriations Committee on Water and Energy has seen fit to fund this so that what our country invested in creating this canal to begin with can actually be utilized by the people in that area. I hope we can get that message back to the other members of our Committee and the people in Washington so that we do not continue to punish the people in Jackson County by giving them something and then taking it away through neglect.

Dennis, I really appreciate what you and Ralph have done, and of course many others, because it is a battle that we continue and I appreciate the efforts you all have made in that effort.

Emmett, I know that you speak very well for so many people in the region. We heard the compliments passed out by Eli Mayfield and I have heard them repeated by many people. But I think it is important when we are in this era when there is so much discussion about any development hurts, harms, destroys our environment. Now I have had the benefit of being out at Lake Texana and being on the premises of the Lavaca-Navidad River Authority, but for the record I would appreciate you giving a very brief status report on the environment and particularly the wildlife, comparing it before the lake was created and the accusations that you would destroy the deer herd. Give us a little report on the environment if you would.

Mr. GLOYNA. The Authority operates a 10,000 acre reservoir and some 7,000 acres of land around the reservoir, which we maintain as a wildlife preserve. With proper maintenance of this preserve and improvement of the habitat, we have probably increased the deer population four or five fold, as well as other wildlife. And it really does rub us hard when we are charged with not having proper environmental concerns.

We at the River Authority feel like we are down in the trenches all the time because we are maintaining the water quality of an entire basin and that is a pretty tough job to do. There is all sorts of intentional pollution and unintentional pollution that we maintain surveillance on, as well as taking care of the wildlife. So we are down in the trenches taking care of the wildlife and it hurts pretty badly when someone from some distance away says that, you know, we are not really concerned with the wildlife, we just want to sell water.

Mr. LAUGHLIN. Emmett, as I appreciate the history of Lake Texana, the local residents for the most part resisted the construction of that lake for the reasons that ran the gamut of you are taking our land, we are losing our agricultural opportunities, but it was pushed by the federal government representatives in Washington, DC and far off places under the guise that it would help the economic development of Jackson County, would add to the tax base, it would attract additional businesses, it would provide recreation to the region and probably the most important, it would provide a basis for repaying the federal government the cost of the money for that project. Is all that a fair summary?

Mr. **Gloyna**. That is correct, Congressman.

Mr. **Laughlin**. Does the federal government look to Jackson County and/or the Lavaca-Navidad River Authority for repayment of some debt to the federal government?

Mr. **Gloyna**. For $68 million—we are indebted to the federal government for $68 million and we have now a way to repay that debt with water sales if we could construct the pipeline to deliver the water.

Mr. **Laughlin**. What are your options or avenues for repaying this $68 million debt?

Mr. **Gloyna**. Only through water sales.

Mr. **Laughlin**. No one likes this, and I certainly do not, if you do not sell water, if the federal government will not let you sell water to repay them, it leaves you with two options, as I see it—(1) to default or (2) tax the citizens of Jackson County.

Mr. **Gloyna**. That is correct.

Mr. **Laughlin**. I think you said that.

Mr. **Gloyna**. At the present time we do levy a property tax on the citizens of Jackson County to maintain and operate the reservoir.

Mr. **Laughlin**. When the federal government came to the citizens of Jackson County, did they say you are going to have to pay for this with tax revenues or did they represent you would be able to sell water?

Mr. **Gloyna**. The contract with the Bureau of Reclamation specifically states that the project will be repaid by the sale of water, the maintenance tax was only looked at as a temporary means to support the project until the water could be sold.

Mr. **Laughlin**. And at this time, you do have water that is available for sale?

Mr. **Gloyna**. That is correct.

Mr. **Laughlin**. And just so the record is absolutely clear, your Authority has been given permission in the past to put a pipeline across this 2,200 feet that now the federal government is saying you cannot do. Is that correct?

Mr. **Gloyna**. That is correct. That application I believe took about two weeks for the Bureau to process and approve in 1981. In addition to that, Congressman, we have a contract with the Bureau of Reclamation which states that we do have the right—we in the Water Development Board have the right to construct and operate water conveyance facilities on federal lands—on these same federal lands that are in dispute now. So in a way we view this as breach of contract.

Mr. **Laughlin**. Well there are many others that view it the same way.

Mr. GLOYNA. Correct.

Mr. LAUGHLIN. Munson, I need to ask you a few questions. These companies you have mentioned that operate and employ people on the Victoria Barge Canal, if I am not mistaken, are all involved in the international competition, in the international marketplace, is that correct, to your knowledge?

Mr. SMITH. Yes, that is true.

Mr. LAUGHLIN. The question I have to you, do you have with you figures, dollar amounts, indicating the additional extra transportation expense that these companies have to spend each year on transportation costs because the Victoria Barge Canal is more shallow than the Gulf Intracoastal Waterway system is?

Mr. SMITH. No, all I have are the estimated benefits, annual benefits, but I do not have those figures. I could get them and make them a part of the record.

Mr. LAUGHLIN. Let me throw a figure at you and you see if it is in the ball park of what you could agree. A couple of weeks ago I was visiting with John Trigg who works for Carbon/Graphite about this very matter. We were seated on a plane going back to Washington, DC, and in our talking about Victoria Barge Canal, he indicated to me his company sends three barges per month up the Victoria Barge Canal, and because they cannot load a barge at the optimum capacity that it could carry in the Gulf Intracoastal Waterway system, those three barges a month, 36 barges a year, cost his company transportation costs alone going from the intracoastal water canal system into our Victoria Barge Canal, a sum of approximately $250,000 a year in additional transportation expense. Do you have any feel for that?

Mr. SMITH. Yes, I have heard figures in that range.

Mr. LAUGHLIN. And that was his company's figures, which is only one of many users, and he said I could not begin to estimate British Petroleum, Union Carbide and many other companies who ship a great deal more volume in barges than we do. Is that also your understanding that these companies actually——

Mr. SMITH. That is true. And the sand and gravel, of course those companies that depend—that have a lot of weight per shipment probably stand to gain more by the efficient use of the barges.

Mr. LAUGHLIN. I know from a report that I recently read that right here in Victoria we have the 11th largest sand and gravel producer, transporter of sand and gravel in America and that is the Fordyce Company operated by Bobby Briggs and I think Jack Owen is here somewhere—Jack, that is correct—there you are over there.

Mr. OWEN. That is correct, 11th in the nation.

Mr. LAUGHLIN. Eleventh largest in the nation and it is located right here on the barge canal.

Jack, I know you are not at the table, but can you just give us a ball park figure of the number of barges that you have shipments on through the barge canal on an annual basis?

Mr. OWEN. We do it by tons, of course, the navigation district keeps the number of barges. We are now averaging 300,000 tons per month across the barge dock. This is an increase over last year of some 10 to 12 percent. Last year we had 2.7 million; this year to date we already have——

Mr. **LAUGHLIN**. If the barge is operating in the Victoria Barge Canal, you have to load it at a lighter capacity than if it were just operating in the Gulf Intracoastal Waterway?

Mr. **OWEN**. That is correct. For the additional two feet, we could cut down on the number of barges if we pick up and expand our ability to load more tonnage. Yet the consumer on the other end saves approximately 40 cents a ton.

Mr. **LAUGHLIN**. And you are talking about the consumer that would be purchasing the sand and gravel from your company?

Mr. **OWEN**. Right. It would be various highway projects, various commercial dealers, this type of thing.

Mr. **SMITH**. I think—excuse me, Congressman, I think the number of barges that Fordyce would ship on an annual basis would be in the neighborhood of 400 per year.

Mr. **LAUGHLIN**. Okay. Munson, I have understood for some time, and correct me if I am wrong, that some years ago—and I do not recall the number—there was an agreement made between the federal government and the Victoria Barge Canal, the navigation districts, that the Victoria Barge Canal would be brought to the same dimensions, recognizing the economic benefits. Is that correct?

Mr. **SMITH**. I do not know that there was an agreement per se. When the Victoria Barge Canal was authorized in 1945–1946, provision was made for widening of the channel to a bottom width of 125 feet, so that when the local interests, the navigation district, acquired the right-of-way for the project, they acquired the right-of-way according to the Corps of Engineers specifications, which included at some point in time expanding the bottom width to 125 feet.

The navigation districts also had the responsibility at that time of relocating all of the structures crossing the channel in order to provide an unrestricted right-of-way. Those included some 29 pipelines, major pipelines, at a very substantial cost. Those pipelines were relocated under the proposed construction depth to accommodate the deepening and the widening of the channel, so that all of the structures are relocated and in place to accommodate the widening and deepening and it has always been, from the very beginning, more or less the implied understanding, I would say, of those members of Congress that represented this district and our navigation district that when it was justified, the canal would be widened and deepened. We feel that we have been able to show from the benefit to cost ratio, favorable benefit to cost ratio, that the widening and deepening is justified.

Mr. **LAUGHLIN**. Well it seems to me that there was at least the tacit understanding, since the navigation district required the pipelines to move at very substantial expense, the pipeline structures so that the Victoria Barge Canal today, as I understand it, has the capacity to expand without moving pipelines and without moving other structures, to expand its width and depth to match that of the Gulf Intracoastal Waterway system, is that correct?

Mr. **SMITH**. That is true, yes.

Mr. **LAUGHLIN**. Would you not agree that there would be substantial economic benefit to the region if the Victoria Barge Canal were of the same dimensions as the Gulf Intracoastal Waterway system?

Mr. SMITH. Yes, I think we have displayed that in the various hearings that we have had on this, and the project reports that have been conducted by the Corps of Engineers.

Mr. LAUGHLIN. Thank you very much. Eli, you have said it all, so I am not going to have any questions for you.

In conclusion, Mr. Chairman, I just want to thank you and Congressman Hancock for taking time out to have this hearing. I think from the comments we have had from all the various interests, it demonstrates the vital need for good, strong, sound transportation systems within the parts of Texas—we call rural parts because they are not downtown metropolitan areas like Houston and Los Angeles.

So I thank you for taking the time to come hear the citizens of this district who have testified to the importance of water transportation, highway transportation, aviation transportation to our area, and particularly to Mel Hancock who has a primary going on in Missouri today. Mel, I am confident you will be back in Washington in September.

Mr. HANCOCK. Who knows.

Mr. LAUGHLIN. Being the winner of a primary today, and I look forward to joining you and Jim Inhofe and Bill Emerson along with Chairman Anderson up in your district late this month for a similar kind of hearing, a hearing of the importance of mid-America and the rural areas that Mel tells me is one of the more beautiful spots in America, and that is the rural part of southwestern Missouri that he represents.

So Mr. Chairman, I conclude my remarks by thanking you and I think you can tell from the sincerity of all these witnesses how important infrastructure and transportation is to this region of Texas.

The CHAIRMAN. Mel, do you have any questions?

Mr. HANCOCK. Mr. Chairman, I would just like to make the comment that I am extremely impressed with the caliber and the competence of the witnesses that testified down here. Greg is representing—an outstanding area and a lot of outstanding people. It was a pleasure for me to have been here today. I am looking forward to getting back down here one of these days.

Thank you for having me down.

The CHAIRMAN. Thank you, Mel.

In conclusion then, I would like to thank Greg Laughlin, his capable staff, Mel Hancock and each of the witnesses for appearing here today. We have heard a great deal about the seriousness of the infrastructure situation.

Let me suggest that one of the first steps toward a solution is in realizing that the decision to deal with these problems is not an optional one. Sooner or later the work must be done. Every day we delay, the costs mount. The solution will require a considerable commitment of our resources, some combination of federal user fees, state and local revenues, but also massive amounts of cooperation, commitment, imagination and hard work on everyone's part. Even so, I am optimistic. Our greatest national achievements have come in response to our most demanding challenges.

I want to thank you again.

With that, the Committee stands adjourned.

Mr. **LAUGHLIN**. Thank you, Mr. Chairman.

[Whereupon, at 11:44 a.m., the Committee was adjourned.]

PREPARED STATEMENT OF WITNESSES

Statement of Neill Amsler

VICTORIA ECONOMIC DEVELOPMENT CORPORATION, INC.

August 7, 1990

The Honorable Greg Laughlin
United States House of Representatives
414 Cannon Building
Washington, D. C. 20515

Dear Congressman Laughlin:

I appreciate very much the invitation to address Glenn Anderson, Chairman of the Public Works and Transportation Committee. The infrastructure items needing improvement can be divided into five categories:

1. Highways
2. Commercial Air Transportation
3. Waterways and Ports
4. Water Supply
5. Hazardous Waste Disposal

HIGHWAYS

In order to attract many types of manufacturing and/or distribution firms, four-lane highways must be available from a city like Victoria to all major metropolitan areas. The State of Texas, working with local Victoria area leaders, has adopted a long-range highway improvement plan which will accomplish our goals. However, neither prioritization, funding nor timing has been addressed. We would request that funding for Highway 59 to Laredo, Highway 87 from Port Lavaca to San Antonio and Highway 77 to Waco be expedited. The portion of Highway 87 from Port Lavaca to Victoria is important as both an economic development tool and as a hurricane escape route for coastal residents. This latter need is urgent in light of the massive Formosa expansion and associated population growth expected in Port Lavaca.

COMMERCIAL AIR TRANSPORTATION

Victoria is fast becoming a regional air transportation center. We are breaking commercial air service records and could benefit from having a second carrier. However, a new terminal building is mandatory to accommodate any additional traffic, not to mention a second carrier. Victoria County and the Victoria Airport Commission has an application pending for Federal participation in the construction of a new terminal facility. Support in our receiving a positive and timely response to this application will be appreciated.

WATERWAYS AND PORTS

With respect to ports and waterways, we have two projects requiring attention. The Victoria Barge Canal is presently 9 feet deep and 100 feet wide. This requires

Post Office Box 7 □ 702 N. Main, Suite 104 □ Victoria, Texas 77902 □ (512) 575-0241

barges to operate at about 75 percent of capacity. To increase efficiency, we need a depth of 12 feet and a width of 125 feet. Again, the application for funding has been submitted with partial funding for studies and maintenance heretofore granted. We need the major construction funds allocated.

A long-range project is the deepening of the Matagorda Ship Channel which serves the Port of Point Comfort in Calhoun County. The channel is presently 36 feet in depth while most European and Asian ports are between 40 and 42 feet. As environmental laws make development in Houston and other similar areas more difficult, we want to become the best alternative and a deeper ship channel will definitely help.

WATER SUPPLY

At the present time, the region enjoys an adequate surface water supply for industrial development. However, local authorities believe our reserves could be depleted in 10-to-20 years. Since a new reservoir on the Guadalupe River will require at least 30 years to permit, build and fill, it is obvious that we are going to experience a serious shortage of water for a fairly long period of time. Further, that time period continues to lengthen as the start of a project will not occur until the problem is acknowledged and a solution found for its resolution.

HAZARDOUS WASTE DISPOSAL

Lastly, the Victoria region has, since the early 1950's, been an excellent location for large petrochemical operations. These businesses have flourished and continue to grow. However, small-to-medium-sized firms have not chosen to locate plants here. This has been primarily due to the fact that they do not generate sufficient wastes or revenue streams to economically dispose of the wastes generated. Locations like Houston with its regional chemical waste disposal facility have succeeded in locating most of these smaller firms. If we are to compete for the much larger number of small facilities, we also need a chemical waste disposal facility. Facilities of this type are owned and operated by agencies of the State government. If the Federal government can help with funding and/or permitting of a project of this type, our local infrastructure will be dramatically enhanced.

Sincerely,

Neill F. Amsler
Executive Director

REGIONAL HEARING

on

THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

Testimony of

PATRICK RHODES
Victoria Regional Airport
Victoria, Texas

August 7, 1990

My comments this morning will be directed at the essential needs of the Victoria Regional Airport if it is to remain an important part of the intermodal transportation system in this region. Our airport is an essential element in the process of recruiting new businesses and industries to this area.

The Victoria Regional Airport is a large physical facility, that has four runways, the associated taxiways, aircraft parking areas, published instrument approaches, and a non-federal instrument landing system. Presently, our airport is used primarily by general aviation aircraft with some corporate traffic and scheduled commuter service provided by Britt Airways, operating as Continental Express.

In order for this facility to continue to be functional for these general aviation, corporate, and commuter operations the following projects need to be completed.

1. A new terminal building needs to be constructed. Our commercial enplanements have grown by leaps and bounds over the last three years.

   1987--11,410
   1988--13,836
   1989--19,592
   1990--24,000 (projected-12,556 through July)

   By comparing our present enplanements to space requirements recommended by a FAA Advisory Circular:

	Recommended:	We Have:
Screening Area	150 s.f.	100 s.f.
Departure Gate	500 s.f.	140 s.f.
Lobby	700 s.f.	600 s.f.
Circulation Space	200 s.f.	0
TOTAL	1,550 s.f.	840 s.f.

   Our present building was constructed by the US Air Force in 1952, as a semi-permanent structure. This building has served us well, but time has passed it by especially when considering the growth of our region, FAA security requirements, area plant expansions, and all the other modern facilities in the area.

2. The ramp and taxiway areas need to be upgraded. Over the short term, say the next 5 years, this upgrade could consist simply of selective slab replacement and a project to seal the expansion joints.

   Our airport has two runways that because of their length are in most cases limited to use only by smaller general aviation aircraft. One of these runways was recently rehabilitated using an asphalt overlay procedure. This runway will be functional well into the next century with only routine maintenance required. The other runway of similar operational capabilities needs to have surface rehabilitation using selective slab replacement and joint sealing procedures or a surface overlay. A third runway, 17/35, has sufficient length to handle most commuter and corporate operations. The surface is presently in good condition, but is showing signs of deterioration. Airport records indicate that this runway was originally built in the early 1940's. The best option on this runway would be selective slab replacement and joint seal, making this a useable runway for many years to come.

3. A majority of the existing underground airfield drainage system was installed in the early 1940's. The newer portions of the system are easily more than 35 years old. Although still functional, the system shows signs of significant deterioration. A non-functional drainage system can contribute to degradation of runway and taxiway surfaces which in turn can effect the safe operation of our airport, and increase maintenance costs.

4. Two other areas that are included on our 5-year Capital Improvement Program are replacement of taxiway light cables (many were installed by the US Air Force) and the upgrade of our instrument landing system that was installed in 1973.

The items that I have mentioned thus far are being worked on and it is reasonable to say that they will be accomplished, assuming that present AIP Grant program stays in place and continues to by funded.

In the final evaluation, Victoria Regional Airport has one shortcoming that may prevent it from continuing to be a part of the transportation infrastructure in this region. This flaw is the load-bearing capacity of the existing primary runway (12L/30R). It must be remembered that this runway was built before today's commercial and large corporate jets were even on the drawing board.

This has been a short overview of where this airport stands as a part of this area's transportation infrastructure. For the present and the short-term, it will certainly remain an integral part of the system. In the event that the needs of the region require a facility for larger, heavier commercial air traffic, the Victoria Regional Airport will have difficulty meeting that need because of the landing weight restrictions previously mentioned.

Each of our airport needs require significant capital outlay. This capital requirement makes the continuation of enplanement entitlements through AIP essential to the continued growth and success of this airport. Although most of the conversations concerning Passenger Facilities Charges centers around large-hub airports, they are important to all airports including this one. Your support of these valuable revenue sources is essential to the future of Victoria Regional Airport and will certainly be appreciated.

Statement of Charles Williams

HOW GENERAL AVIATION IS IMPORTANT TO THE GULF COAST REGION

THE TOPIC OF MY TALK IS HOW GENERAL AVIATION IS IMPORTANT TO THE GULF COAST REGION. GENERAL AVIATION IS IMPORTANT TO ALL OF THE GULF COAST REGION FROM THE SABINE RIVER TO BROWNSVILLE. THE ECONOMY IN TEXAS IS UNDER GOING A CHANGE. IN THE PAST TEN YEARS IF HAS GONE FROM REALLY GOOD TO REALLY BAD AND WE HAVE ALL SUFFERED IN GENERAL AVIATION. OUR AIRPORTS HAVE SEEN A REDUCTION IN TRAFFIC, FUEL SALES, RENTALS AND AIRCRAFT SALES. THE OIL & GAS INDUSTRY, THE SAVING & LOAN DOWNFALL AND A JOB SHORTAGE HAVE ALL BEEN FACTORS IN THIS PROGRAM. NOW I THINK WE CAN ALL SEE A LITTLE IMPROVEMENT AND MAYBE A LIGHT AT THE END OF THE TUNNEL. I BELIEVE THE ECONOMY IS STARTING TO MAKE A SWING TOWARDS IMPROVING AND I CAN SEE IT AT MY AIRPORT AND IN BAY CITY. FUEL SALES ARE INCREASING, HANGAR RENTALS ARE UP AND OUR STUDENT ACTIVITY IS INCREASING. WITH THIS SMALL IMPROVEMENT TO OUR ECONOMY WE HAVE TO LOOK TO THE FUTURE AND BE PREPARED. WE HAVE TO HAVE OUR AIRPORTS UPGRADED TO MEET THE TRAFFIC, BECAUSE WHEN THE ECONOMY GETS GOOD AGAIN, GENERAL AVIATION WILL GET GOOD AGAIN. GENERAL AVIATION WILL TRANSPORT PEOPLE FOR RECREATION AS WELL AS INDUSTRY. THE PETRO-CHEMICAL, PLASTIC, OIL AND GAS, FARMING AND THE SEAFOOD INDUSTRY WILL BENEFIT FROM GENERAL AVIATION. I AM MORE FAMILIAR WITH THE GULF COAST REGION WHERE I LIVE AND WORK. THE AREA BETWEEN GALVESTON AND CORPUS CHRISTI IS SOME OF THE LEAST DEVELOPED ON THE TEXAS GULF COAST. THIS PART OF THE GULF COAST IS IMPORTANT TO MOST OF US IN THIS ROOM AND I THINK THAT IT WILL BE THE NEXT BIG BOOM AREA ON THE GULF COAST. I BELIEVE THAT OUR PART OF THIS REGION IS THE PRIME TARGET AREA, BECAUSE:

1. THE JETTY PROJECT AT THE MOUTH OF THE COLORADO RIVER
2. THE SOUTH TEXAS NUCLEAR PROJECT

THE JETTY PROJECT AND DEVELOPMENT OF THE COLORADO RIVER FROM THE MOUTH TO THE PORT OF BAY CITY WILL OPEN UP THE OFFSHORE FISHING AND SHRIMPING INDUSTRY FOR OUR AREA. ALSO, THE BARGE TRAFFIC UP THE COLORADO RIVER WILL INCREASE THE PROSPECTS OF INDUSTRY ALONG THE RIVER FROM MATAGORDA TO BAY CITY. THE SOUTH TEXAS NUCLEAR PROJECT WILL ALSO ATTRACT ALL KINDS OF INDUSTRY WITH THE READY SUPPLY OF POWER FOR THEIR USE. WE ARE ALREADY SEEING THE EFFECTS OF THIS GROWTH THROUGH INQUIRIES WE RECEIVE AT OUR CHAMBER OF COMMERCE. K-MART, HEB, WALMART AND SUTHERLAND LUMBER COMPANY HAVE JUST EXPANDED THEIR BUSINESS IN BAY CITY AND ALL OF THEM USE OUR AIRPORT. WITH NEW GROWTH AND EXPECTED GROWTH WE MUST LOOK FORWARD AND HAVE OUR AIRPORTS READY. OUR AIRPORTS ARE LIKE HIGHWAYS INTO OUR CITIES AND GENERAL AVIATION WILL USE THESE "HIGHWAYS" TO GET TO OUR CITIES. WHEN A COMPANY CONTRACTS OUR CHAMBER OF COMMERCE ABOUT LOCATING IN BAY CITY ONE OF THEIR QUESTIONS IS ABOUT THE AIRPORT. WE NEED TO MAKE OUR CITY AND COUNTY OFFICIALS AWARE OF THIS. THESE OFFICIALS CAN BE INSTRUMENTAL IN THE PROMOTION AND FUNDING OF OUR AIRPORTS. THE WAY I LOOK AT MY AIRPORT IS THAT THE SLAB OF CONCRETE CALLED A RUNWAY IS JUST LIKE THE MAIN HIGHWAY COMING INTO OUR CITY. THAT HIGHWAY DOES NOT MAKE ONE DIME FOR YOUR CITY, BUT WHEN YOU SURROUND IT WITH CURBS, GUTTERS, STREET LIGHTS AND OTHER IMPROVEMENTS, IT WILL THEN ATTRACT BUSINESS WHICH WILL BROADEN

THE TAX BASE AND PRODUCE REVENUE FOR YOUR CITY. YOUR AIRPORT IS IN THE SAME SITUATION, THAT RUNWAY IS NOT GOING TO MAKE MONEY OR ATTRACT BUSINESS UNTIL YOU IMPROVE IT WITH LIGHTS, VISUAL AND INSTRUMENT APPROACHES AND SERVICE. I TELL MY EMPLOYEES THAT ALL AIRPORTS HAVE THE SAME THINGS FOR SALE, SUCH AS FUEL, OIL AND PILOT SUPPLIES. THE ONLY THING WE CAN OFFER THAT OTHER AIRPORTS DON'T HAVE IS SERVICE. IF YOU GIVE YOUR CUSTOMERS GOOD SERVICE AND TREAT THEM LIKE YOUR GUEST, THEY WILL COME BACK AGAIN AND AGAIN. THESE ARE THE THINGS THAT WILL ATTRACT CUSTOMERS TO YOUR AIRPORT. SO THE GROWTH OF THIS REGION OF THE GULF COAST IS UP TO US. WE MUST ATTRACT BUSINESS TO OUR AIRPORT AND OUR COMMUNITIES. WITH THIS GROWTH AND ADDED BUSINESS GENERAL AVIATION WILL PLAY A VERY IMPORTANT ROLE. GENERAL AVIATION CAN BECOME A VIABLE SOURCE OF INCOME FOR YOUR LOCAL ECONOMY.

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

TUESDAY, AUGUST 7, 1990

House of Representatives,
Committee on Public Works and Transportation,
Fort Worth, TX.

The committee met, pursuant to notice, at 12:15 p.m., in City Council Chambers, City Hall, 1000 Throckmorton, Fort Worth, Texas. Hon. Glenn Anderson (chairman of the committee) presiding.

Present: Representatives Anderson, Hayes, Geren.

The **Chairman**. The hearing will come to order.

Good afternoon. The Committee on Public Works and Transportation hearing on the future of our Nation's infrastructure needs will come to order. It is my pleasure to welcome you here today and thank you for taking time from your busy schedules to share with us your concerns, your knowledge and perspectives on this important subject.

For several months now, our Committee has been examining many aspects of the infrastructure issue, seeking a better understanding about our Nation's public works crisis. We have explored emerging infrastructure needs from the national perspective and reviewed the impact of infrastructure on private sector investment and on productivity, on growth and the ability of the United States to compete in the international markets. We plan to also look at the infrastructure financing alternatives and new technologies.

It is important, however, that we understand what kind of infrastructure problems are being experienced at the state and local levels. So we have embarked on a series of hearings at various sites around the Nation to talk about the inadequacies of existing public facilities with people most directly involved and to get a broad range of ideas and suggestions that can help to resolve some of the problems.

Earlier this month, we met in St. Clairsville and Youngstown, Ohio. Yesterday, we were in Lafayette, Louisiana and this morning in Victoria, Texas. Tomorrow, we will be in Atlanta and Conyers, Georgia. Hearings are planned for other areas of the country as well.

I am pleased to be here in Pete Geren's district, and I want to thank him and the people of the 12th District for their generous hospitality. Pete is certainly a hard-working newcomer to the Congress and is making his presence known. He strongly favors tougher law enforcement to fight drug use. As a member of the Veterans' Affairs Committee, he works long and hard for veterans' benefits. We especially welcome his participation on the Subcommittees on Aviation, Public Buildings and Grounds, and Water Resources, and his support on issues that have come before our Committee. As one of the active members on the Aviation Subcommittee, he has been in the forefront of efforts to save the V-22 Osprey tilt rotor aircraft, both for its military value and because he sees the potential civilian use of this vital technology as important to United States competitiveness.

I am also pleased that we have with us another member of our Committee, Congressman Jimmy Hayes. In fact, our hearing yesterday in Lafayette, Louisiana, where we received some excellent and beneficial testimony, was in his district. We are happy that he could join us today.

As Pete and Jimmy know, when we speak about infrastructure we are speaking about the very cornerstone of our cities and rural communities. Inadequate infrastructure weakens our economic foundations, threatens the health and safety of us all, and jeopardizes our future standard of living and the quality of life we have come to enjoy.

When addressing the importance of infrastructure, we should note that recent economic research shows a link between the level of public investment in the Nation's infrastructure and productivity and profitability in the private sector. The United States productivity growth rate fell from 1.8 percent annually in the 1960s to less than 1 percent, to 0.7 percent, in the early 1980s. During the same period, the annual growth rate of spending for infrastructure fell from 2.5 percent, again to less than 1 percent, 0.8 of a percent.

Productivity in our country is growing much slower than in other developed nations such as Japan, West Germany, Canada, France, Italy and the United Kingdom–our economic competitors–some of which invest almost five times as much in their public works as does the United States. We, in fact, rank 55th in the world in infrastructure investment.

All evidence reflects that our 20-years-plus of under-investment in public works spending at all levels of government has caught up with us, and we are seeing wide-ranging and serious problems.

It is time to do something about it. Last week I introduced a concurrent resolution, which was co-sponsored by several of my colleagues, expressing the sense of Congress that 1991 should be the rebuild America year. It calls for the President and Congress to work toward establishing a comprehensive national policy to rebuild the infrastructure of the United States. We must recognize that the condition of our infrastructure is one of the Nation's most important issues and it must be given a high priority, regardless of the deficit. The longer we wait, the more harm we do to our economy and the more costly the job will be.

Meantime, we are continuing our inquiry and look to you to help us gain further insight into infrastructure needs. Our question today is: What is the condition of the infrastructure in Texas, particularly this region of the state? Is your network of public facilities—your roads, bridges, public buildings, prisons, sewers and wastewater treatment plants, water supply facilities, and other basic services—are they adequate to meet current and anticipated needs of the area?

Who do you think should pay for necessary public works and what financing techniques have you considered? What do you think the federal role should be? The state role? The local role? What should our Committee be doing to resolve some of these problems?

We look forward to your answers and to any questions that you may raise.

I would now like to recognize Congressman Geren and Congressman Hayes for any opening remarks they may wish to make.

Mr. GEREN. I would yield to Congressman Hayes at this time.

Mr. HAYES. I would like to comment on two things. One is unrelated to this hearing directly. Having served in Congress with Dick Cheney before you came, the Secretary of Defense, I have imposed upon that previous relationship to suggest to him tactics in the Gulf of Iran. I feel that our military power should be concentrated on preserving the carrier independence and the Texas International Guard should conduct their operations to protect the oil fields in Saudi Arabia. [Laughter.]

I am actually here because of my colleague, Pete Geren. Before he was sworn in after he was elected, a cousin called me, who attended the University of Texas, and he said, you are really going to like the guy that they elected in Fort Worth, and that has been an understatement. We have served together both on the committee, obviously, but on the Subcommittee on Aviation. I never realized until I had to sit next to him just how much I was going to learn about the airport and about a certain congressman from Kansas, who we have shared some views about how the airports should be run.

So for that reason, I have got to see that he has lived up to the reputation which friends of mine shared on those days before we had become friends.

It is purely for that reason that I enjoy working with him. The needs of our two states are quite similar, not only in base of oil, gas and agriculture, but the realization that we, unfortunately, share in so many of our cities a decayed infrastructure, where it is time for the United States to do maximum innovation. And in order for the Sun Belt to continue to prosper, we have got to have the wheels of commerce that can be interconnected by our arterials on the ground and our air links.

I look forward to hearing about the problems and some of the challenges that you have in the Fort Worth community as he was so kind to do yesterday in our hearings in Lafayette. I think together we can hope that we can bring some improvement both to the area of southeast/southwest Texas and that little corner of southwest Louisiana.

Once again, thank you very much.

Mr. GEREN. Thank you, Jimmy, and thank you, Chairman Anderson, for being here today and for bringing this hearing to Fort Worth and to Tarrant County.

I want to apologize to everyone who is here for our little bit late start. We landed out at Carswell Air Force Base, and as luck would have it the vehicle that was planned to bring everyone in did not work, so we had to go to Plan B, and we had to scramble a little bit to get here. I apologize for imposing on you, and I want to thank everyone for being here.

This is a very important hearing, and we are honored and fortunate to have Chairman Anderson here, who is the leader in Congress on the issue of investment in our infrastructure. It is a subject that has been neglected, unfortunately, to our detriment, to the detriment of the productivity in this country, and we have seen it in this state and other states as well.

There are so many other things that cry out for attention we tend to under-invest in infrastructure. We recognize the need for it by having dedicated funds. But even those dedicated funds are not sufficiently well protected to protect them from the reach of Congress. We have done a pretty good job, unfortunately, of spending those dedicated funds that were earmarked for infrastructure. We have borrowed them and spent them elsewhere. We cannot let this continue.

As a country, we are falling behind the rest of the world in infrastructure investment. Our area has a great future, but it is one that is going to require significant investments, and one that requires partnerships. In this day and time hardly anything is done by city government, county government, state government and federal government. It is all done together, and it is critical that we understand the needs of each of them. That is why these hearings are so important; they help us identify common goals, common opportunities and common challenges and work together to meet those challenges and build the kind of future that is out there if we make the investment.

I want to thank this distinguished panel for being with us today—Commissioner Dionne Bagsby, Commissioner J. D. Johnson, and America's number one mayor, Mayor Bob Bolen—for taking your time to share your thoughts with us. I certainly appreciate it and I know each of you has many, many demands of your time and appreciate your making the time to help educate us and this committee and the U.S. Congress on the needs of our region.

Thank you, Mr. Chairman. Thank you very much.

[The prepared statement of Mr. Geren follows:]

STATEMENT OF CONGRESSMAN GEREN

Thank you Mr. Chairman. I commend you for holding this hearing today in Fort Worth and I welcome you and Congressman Jimmy Hayes to the 12th Congressional District.

Today you will hear testimony from an outstanding group of witnesses who will describe the infrastructure needs of Texas, Tarrant County and Fort Worth. The witnesses today will give us an important insight into the infrastructure needs of the 12th Congressional District, an area that we expect to experience tremendous growth in the coming years.

In the October 23, 1989 edition of Fortune magazine, the Dallas/Fort Worth Metroplex was rated as the top city in America. The Metroplex, which includes Fort Worth, Dallas, and the many smaller cities that are part of our regional economy, is "Today's dream location for business." The magazine stated that "talented workers with a wide range of skills are just waiting for a call, and population growth will support continued economic expansion".

But, as we expand, will we have the infrastructure in place to meet the challenges that will be presented by this increase in economic development and economic opportunities? Will we be able to meet the needs of these new businesses and increased population?

When we talk about the infrastructure of Fort Worth and Tarrant County, the first thing that may come to mind is our highways and airports. But "infrastructure" means much more. It includes many things that ensure that our citizens enjoy a quality of life that they deserve. It is more than concrete and steel—infrastructure is productivity and jobs.

Mr. Chairman, we do have infrastructure needs that must be addressed and that are long overdue. Here in Fort Worth and Tarrant County, we must continue to invest more in our roads, bridges, airports, educational and public buildings, flood control, water supply and wastewater treatment facilities. We must invest more in these areas that are so important to our communities and on which the future depends.

Our goal must be to do all that we can to improve our communities to ensure that the high quality of life we value is enjoyed by future generations.

Today's witnesses will focus on our infrastructure needs and on the future needs to meet this goal.

Mr. Chairman, I appreciate your decision to hold this hearing in Fort Worth and I appreciate Mr. Hayes and all of the witnesses for taking the time from their busy schedules to participate in today's hearing.

Thank you.

The CHAIRMAN. Thank you.

We might as well get going. Unfortunately, we are on a tight schedule and must wind up this session as close to 5:00 o'clock p.m. as possible. We will be flying to Atlanta this evening for another hearing there in the morning. Because there are so many of you who have been willing to participate in this hearing, and because of the time constraint, I am going to ask that you summarize your statements in no more than two or three minutes. That should leave us some time for questions. I want to assure you that your written statements will be printed in their entirety in the record of this hearing.

I also note that most witnesses are on panels. I would suggest that we hold our questions until each panelist has made an oral statement. And because of the number of witnesses testifying, it may be difficult to ask questions of each individual. Some questions may be general, and I will leave it up to the panel members to decide who will respond and please, again, be as brief as possible.

Now I want to call on our first panel of witnesses, and they are: The Honorable Bob Bolen, Mayor of Fort Worth; and two commissioners of the Tarrant County Commission, Mr. J.D. Johnson and Ms. Dionne Bagsby.

And, Mr. Mayor, we will call on you first.

TESTIMONY OF BOB BOLEN, MAYOR, FORT WORTH; J.D. JOHNSON, COMMISSIONER, TARRANT COUNTY; AND DIONNE BAGSBY, COMMISSIONER, TARRANT COUNTY

Mr. BOLEN. Thank you, Mr. Chairman. I do appreciate you having this committee hearing here with your colleagues. We appreciate you coming back to Fort Worth from your past visits. It gives us an opportunity to give you a broad-brush view of where we see our infrastructure needs and ways to try and fund those.

Obviously, when you come into the area, we have many things on the drawing board that are very, very important to the area and the economic development of this country, we hope: the supercollider that we are working on that you are certainly aware of. It is going to take tremendous infrastructure needs with funding from the cities and states and counties. We have DFW that is expanding as rapidly and as fast as we can do that, and we just recently are going to have the opportunity, maybe, of having a surtax charge so we can capture at the airport with the Committee's indulgence. We have the first industrial airport in the world and it is Alliance Airport that is just north of here. That is expanding extremely rapidly as far as ancillary businesses around American Airline's new maintenance facility that they are working on today. That is in Commissioner Johnson's territory. And we also have the I-30 infrastructure and highway connection right behind us here just to the south. All of those will take enormous amounts of money. They are all vitally needed if we are going to continue the expansion of growth of our industrial complex in this area.

And when we are in an area where we have Bell Helicopter and General Dynamics and many of the other military-established firms building the hardware for our armed forces, and we see the transition going on today, it is more important than ever before that we expand those areas that are going to be our future: The Tandys, the Houstons, the other firms around the world that are expanding in this particular area, and that requires the infrastructure necessary in those areas.

We touched on two areas that we know that we have funds available that we cannot reach. You are certainly more aware than we are. The FAE Trust Fund and the Highway Trust Fund, those dollars are there for us to use if we can get to them. When we look back 40 years ago and look at the Eisenhower administration and see what the highway system has done under your two leadership and the other chairman before you in that job, and has built an interconnecting highway system throughout the United States that is the envy of the world. If we are going to maintain that structure and be able to expand upon it and to coordinate that in the areas of the cities throughout America, it is going to take funding.

That means the release of the highway funds and the trust funds and the airports, et cetera, so that we can utilize those funds that were dedicated for that very specific purpose. We know that we are preaching to the choir. What we want you to know is that you have many, many citizens out here that will support you in trying to release some of those funds so we can use them on the needs that we have before us today.

And then I would like to close for my part of this to relate to you, so that you can take this back to the Congress. Many people say, well, let us let the citizens do it at home. I agree with that in many cases. I think we do a very good job of spending federal money and our local taxpayers' money. But the fact is that over the period of the last eight to ten years we have increased city taxes 40 percent, roughly, to cover almost identically the increase in our population, the inflation rate and the loss of almost $12 million in federal funds that we had at that time.

If you take those funds away, and you actually extrapolate that on the citizenry you have today, we are spending almost identically the same amount of money per person in this community that we did almost a decade ago, and we are trying to do many, many more things that we were required to do. The Clean Water Act, the expansion of that, as we read through that, is going to have an enormous cost on our community alone, and no one says where the funds are going to come from to take care of those requirements:

The clean air requirements, the asbestos requirements, all of those. We want a healthy environment, but in a situation where we need to share those ideas together. We need to be part of the solution, and we certainly need you to be part of the financing mechanisms to do the mandates that you are giving us, along with the state of Texas. Those things are necessary. We have tremendous opportunities if we are willing to face up to those, and at the same time we absolutely feel that it is going to be imperative that the federal government is a partner in that partnership and not just a person that says, do this and handle this, and you can take care of it all at home.

I will close with this. That our current budget and over the past 12 months we have reduced our work force almost 8 percent in the City of Fort Worth. We have had one tax increase in the City of Fort Worth during the interim period of time. We have expanded to cover the basic services, but they are stretched to the limit on the property taxpayers of this city.

We cannot continue to increase over and over again on a very narrow tax base, and that is all we have available along with the sales tax, the portion we get to fund all these absolutely necessary requirements that we seek in the future.

So with that, Mr. Chairman, I will stand by for questions of the committee at the proper time. Thank you.

The CHAIRMAN. Okay, thank you.

Next is J.D. Johnson.

Mr. JOHNSON. Mr. Chairman, thank you very much. We do appreciate you bringing the committee to Tarrant County. We appreciate very much our Congressman Pete Geren's interest in our problems that we have here in Tarrant County and Fort Worth, Texas.

It is always hard for me to follow His Honor, as we call him here in Fort Worth, but Mayor Bolen says everything so well and so quickly and, quite frankly, covered most of the items that I wanted to discuss with the committee today. In the interest of time, I will eliminate a lot of my remarks, but let me just put some emphasis on some of the items that he did touch on.

The Alliance Airport that is going to open up new trade possibilities throughout this world. All projects like this cost dollars to get them off the ground, to get them started. The city has spent millions of dollars out there getting the water, the services and the things necessary. Most of the area in and around the Alliance Airport is in the county, and the county roads are the responsibility of the Commissioners Court.

Our funds have been limited in the last four or five years because of the criminal justice breakdown that we have had throughout this nation. The roads seem to be the last part of the problem that we can touch when we start talking about budgets, and that is where Ms. Bagsby and I will be going to see as soon as we finish testifying here today, working on budget projects for the county. We are in our budget hearings now.

But we have a lot of demands being placed on us to get the goods and the traffic that is going to be required to Alliance Airport, to and from that airport, and it is on county roads. And quite frankly, we do not have the dollars to put into that program. The true needs for 1990 in Tarrant County just for the infrastructure of these roads is $18.2 million, and our budget will not even touch that amount. It might get up to a third of it, but we are in desperate need of some help.

The most emphasis that we have put on our problems here in Tarrant County is in the criminal justice arena. We have tripled the size of our jails in four years. There have been a lot of programs cut where we were getting assistance from the federal government and from the state government, and those programs were cut, and it came down to us on the local level to pay the taxes. And trust me, we in Tarrant County are a team. We work together—the cities, the county, the state government and our federal government. But we do need some help that we do not have here today.

Everything that Mayor Bolen touched on as far as the programs and the problems that they have had here in Fort Worth, that hit the county the same way. Our taxes are increasing. We are looking at the possibility of 162 employees being cut from our county payrolls this year. I am not going to say that is for real right now, but that is the numbers that we are looking at. And to make our budget balance, that is what we are going to have to eliminate.

So we need some help at the local level. The taxpayers of our county—you cannot look at what Fort Worth pays in taxes, what Tarrant County pays and what the school district, our bills as far as taxes. You have got to add all those up. And when you add them all up, we have strapped our residents to the limits. They cannot afford to continue paying the taxes that they are paying, and we must have some relief.

We do understand the infrastructure of roadways in Tarrant County. We also understand that we have got drainage problems throughout our county. We have got flooding problems, as indicated here in these last floods that we had.

So we would appreciate your considerations. You have my prepared remarks. I have given you some details of some specific problems that we have throughout our county. We would appreciate any help that you and the committee could give us here in the local area.

Thank you.

The CHAIRMAN. Thank you very much.

The next witness, the Honorable Dionne Bagsby.

Ms. BAGSBY. Thank you very much, Chairman Anderson.

The CHAIRMAN. Did I pronounce that right?

Ms. BAGSBY. Dionne, just like the singer.

I would like to again thank you for bringing your committee to Tarrant County and to the City of Fort Worth. I am delighted that my congressman, Congressman Geren, is serving on the committee. I know the strength that he brings to whatever committee he serves on.

Certainly following these two gentlemen has its problems also. However, they have touched upon a great number of things. One of the things that Commissioner Johnson pointed out, Alliance Airport is in his precinct. Unfortunately, the people who need the jobs the most at Alliance Airport are in my precinct, and so I have to gear my remarks a little bit to the issue of transportation.

The Dallas/Fort Worth metropolitan area is served by an excellent freeway system provided by the State Department of Highways and Public Transportation. During the past two decades, they have done an outstanding job of creating a highway system that is enviable. The system has encouraged the development of predominantly single family residential land use throughout the county and has allowed the dispersion of major job centers throughout the region.

Tarrant County is unique in that it has a different density of urban development which it must contend with on a governmental level concerning public transportation.

There are cities throughout our county that are far removed from the boundaries of Fort Worth: Saignaw, Crowley, Hurst, Euless, Bedford, Benbrook Haslet, Arlington. Fort Worth is singled out since it is the only city in the Tarrant County with a public transportation system. The city is served by the Fort Work Transportation Authority which is supported by a half-cent sales tax. This is unlike DART in Dallas County which serves multi-jurisdictions. Arlington is served by DART in its Handitran program of public transportation for the elderly and the handicapped.

The lack of county-wide public transportation adversely affects economic development in the outlying areas of Tarrant County since employers will tend to choose a location accessible to a large number of the working populace. And, of course, that large number of populace is often in our intercity and in the part of the city that the infrastructure is in the most dire need of rebuilding and repairing. Economic development, which is taking place in the mid-cities areas and in Arlington, is not accessible to many residents of the western part of our county.

Experience tells us that the federal government will not help fund public transportation in areas without at least a 1 percent sales tax base dedicated to public transportation. Recent reports of the North Central Texas Council on Governments show that FWTA has not applied for federal money knowing that we have a base of only one-half cent. They know they cannot compete for federal monies with Houston, Dallas and Los Angeles. So the future expansion of this transit authority is not even in the planning stages.

It is time funds are dedicated to public transportation projects which address existing needs of suburban populace regardless of the tax base of the transit authority. The sales tax is regressive. This type of tax is a burden on those who can least afford it. The lower the income level, the more a family will spend on taxable goods. But these families are the ones who need a public transportation system the most.

There are some exciting projects going on in our city, who certainly show that we do have the ability to work at the local, state or federal level. One of the projects Congressman Geren has committed his time and resources to, and that is the Poly—Main Street Project, which is also a project that has the attention and participation of our academic community.

I urge you to continue your quest to solve this problem, to provide funds that are needed, in my mind, to the infrastructure of this country which means existence of quality of life for its people.

A great nation, first and foremost, takes care of its people and the quality of the lives of those who live in the various places that they live.

Again, thank you for coming. Thank you for allowing us to testify.

The CHAIRMAN. Thank you all for your excellent statements. I will ask maybe a question or two. And before I ask my questions, I would like to compliment the mayor on his reference to the money in the trust funds that is almost unavailable. That happens to be one of my number one issues. I have not gotten very far, but it is one we are working very much on, and we have all identified to the people. I remember the last time that we went on television and radio and pressed on that issue. We told the people that every penny—I think at that time we were raising the gasoline tax five cents—and we told them every penny is going to go into the trust fund and be spent on our highways. Well, see, that is what people think, and it is shocking to know that we cannot get it.

And I remember another issue that came up unrelated to this. You mentioned the airport. Here a few years ago whenever you would pick up the local paper, I do not care whether it is in Los Angeles, or Chicago, or New York—I am not going to say here because I do not know much about it—pick up the paper and there was a near-miss last night at the local airport, and we always see a near-miss, near-miss, near-miss. And I remember the California State Chamber of Commerce coming into a meeting and pointing this out to us and, of course, they seemed to think it was more their concern because so many of them had plants in California, but also had a branch of a plant in St. Louis or had a plant in New York or had something. And they said, we have to get on the airplane every week. We are flying all the time. And every time we pick up the paper there was a near-miss yesterday in the local airport. Of course, some of them were not near-misses. We had one in Los Angeles, I think, that killed 11 or 12 people. That is not much of a miss.

But I said, well, what can we do? I said, we know what has to be done when we go to the airport. They need additional ramps or they need something. I said, we do not have money. And they said, tax us.

What do you mean by us? Well, they said, those of us who fly, tax us. So they actually told us to tax them. And so we put on the 8 percent ticket tax, and that money was supposed to go into a fund to be made available to make airports safe in this country. But again, it got into the same situation as the highway and the transit fund.

We have right now, I will not quote the figures exactly, but it will not be too far, $26 billion just sitting there that we cannot touch today, because we have a financial policy. Usually, I blame the OMB, because they are the ones who kind of like to not spend the trust money because then they can make it look like the deficit is better. If you have got $25 or $26 billion sitting over here, and you have got a deficit over here, you put them both close to each other and it makes you look like your deficit is a little bit less, and they have been just kind of fooling the people.

But my feeling is we have got to somehow get those trust funds released so that we can spend them, each one of them: the Airport Trust Fund, the Transit Trust Fund, the Highway Trust Fund. And I was just glad to hear you mention that because, as I said, it is one of the number one issues that I have, trying to get that thing straightened out.

Now, getting back to our infrastructure here today. Looking at the infrastructure problem from a local perspective, can you give us some idea of what steps you expect to take in Fort Worth and Tarrant County to meet your particular needs, and what kind of help you expect from the state and the federal government?

Mr. Mayor.

Mr. BOLEN. Mr. Chairman, you have touched on part of those. We are expanding to meet the needs of new industry. Like I mentioned before, when we have downturns in the firms that we have supplying military, we know that the Paget firm that is moving here at Meacham Airport. American Airlines maintenance facility will pick up an awful lot of those jobs.

We have another area that is a tremendous opportunity. We probably have the only right of way in the United States between downtown Fort Work, through the Tri-Cities, just north of Arlington, just south of VFW, by Irving City Hall, right down into the heart of Dallas, and we own that collectively between the two cities. With the funding available on that, that has actually generated an income stream. And with that particular corridor, we can build an infrastructure there for whatever it is, high-speed rail or a toll road or a highway, whatever it is, but we know from history that the industry will follow that particular corridor and it will be another tremendous job creator for us in the middle of the metroplex. All of those particular areas give us opportunities if we have ways to fund them.

Now, we are spending every single dollar that we have had in an increase five years ago, $5 million a year just on increased maintenance of the facilities we have available to us for our highway system. We have the I-30 system right behind us that I mentioned earlier, that we are going to have one of the finest connecting interstates in America. We will have eight lanes coming in from three directions, six from the other, and we are going to have a mile and a half right in the center that we need to get on with and finish that up, because that is going to be a bottleneck all throughout the 1990s. Those funds that we have in the trust fund will help us solve that, if we can get those released.

And I might add, as President of National League of Cities, it is our stated policy to help you in any way necessary. All you have to do is ask and you have 16,000 cities who will come to your aid to try and lobby for that particular program.

Ms. BAGSBY. I think a part of your question was what we are doing locally to address our problem. And one of the things that we are most proud of is the inner workings of local governments and the ability for them to cooperate together. We have an active program where smaller cities can come to Tarrant County and use their public works or infrastructure dollars in a more efficient way by not having to buy the big, heavy equipment and having the big work force. They engage in inter-local contracts with Tarrant

County. We provided the equipment and the manpower. They pay for the materials. That has been one of the most impressive and cost-effective methods of local governments cooperating with each other and using their dollars effectively.

So we are doing all we can to spend our dollars well, to be good fiscal managers. We simply need additional dollars. We do not have enough in the pot to do all that is needed in the region that is so inviting and one that has all the earmarks to grow and continue to be a very positive place to live.

The **Chairman**. We would like to have you identify what particular type of projects you are thinking of, and what kind of help you expect from us, so we can work at it through our whole program area.

Ms. **Bagsby**. We have, as a matter of fact, this morning there are three bridges out in the southwest part of this county that we have just applied for getting some federal funds to help repair. The bridges are in very poor repair. We can do the work. We need the dollars to help get those bridges so they will be safer.

Mr. **Johnson**. Mr. Chairman, if I might, and I apologize. I could have gone through my entire remarks that I furnished to the committee, but to touch on what Commissioner Bagsby was just saying about the bridges.

An example of the county not being able to meet strategic needs is the existence of four bridges which need major repair or construction, and that is now. One such bridge out on Indian Creek needs to be replaced or raised, which will entail road construction as well. The work on this bridge does not qualify for monies under the Federal Bridge Program. This infrastructure type of improvement will cost the county over $300,000, something that was not budgeted, something that was found during the floods and the conditions that we had this spring. Since this project does not qualify for federal money, the county cannot make the needed improvements until money is available or until there is some type of catastrophe that takes place. The three other bridges that I'm aware of right now Village Creek, which needs to be replaced, will cost the county another $300,000; with the widening and repair of the other two bridges, we are looking at $1.5 million just on those four bridges, just to get the bridges that we know are harmful to our public today repaired, that we do not have the funds county-wide or local-wide to take care of them.

Mr. **Bolen**. Mr. Chairman, I might call up two things that we think will be of great help to us. You asked how to pay for these things. Fort Worth put in and our voters voted on the quarter-cent sales tax to have a transit system. We voted that in a good number of years ago. Then we raised that roughly a year ago to a half-cent. That still means that we do not qualify for many of the dollars because we are doing a good job of what we are doing, and we are costing the citizens less money. That means we do not qualify to share in the national funds to improve the transit authority that we have.

We do not think we should be penalized because we are doing a better job than some of the other areas in America.

Number two, and an area that I touched on earlier that we can have more documentation for you, as we review the Clean Water

Act, we find the quality of the water coming out of the system that it looks like we are mandated to provide at an enormous cost will be better than it has ever been in history, before man was even here. And what we would like to do is sit down continually with the Congress and your staff and evaluate what is necessary. We want clean water, but we want clean water to the point that is necessary for the health of our community, but not for some enviable position that will bankrupt the entire state and the entire federal government to provide it.

And if we carry it to the extreme as we read it, the cost of that one act will be absolutely staggering, not only to us but every city in America and every state in America. The mandates alone can help us, because you mandate something that is unachievable, it will cost us all more dollars that we do not have today, and not let us use those dollars in areas that we truly believe that we need, and we have a water treatment center and a system here that is second to none in the United States and are continuing to improve.

I might add that we are spending more and more local dollars to provide that. We are costing ourselves, taxing ourself more dollars to provide that. Also, not asking the government to because those funds are being reduced as you all know.

The CHAIRMAN. Thank you very much.

Congressman Pete Geren.

Mr. GEREN. We might consider starting to bottle that treated waste water and go into competition with some of the other bottled water. [Laughter.]

I appreciate all of your remarks that pointed up so many challenges that our country and the city government faces. I think maybe worse in our part of the world because of the difficult economic time that we have gone through, not unlike Jimmy Hayes's district over in Lafayette, Louisiana. We heard the same story yesterday in so many cases.

Each of you has witnessed coming and the passing of a number of federal programs, and we have seen, as you have pointed out, the mandates increase and the funds shrink. In watching over the years and participating over the years, I would like your input into which type of programs and not only how the money was to be spent, but the procedures for delivering the funds, and how much local control was given, which you think best serve the needs of the constituencies that you represent.

I feel that often we do hamstring some of the programs with too many restrictions, with not enough local control. And if there have been some programs over the years that the federal government has extended to the counties, states and cities that you think have been effective, that have been efficient in their delivery of the resources to actually getting more dollars to the projects, I would like you to identify those for us and help us understand what kind of mechanisms we ought to be seeking to really meet your needs.

Mr. BOLEN. Congressman Geren, from the city's standpoint there is no question in my mind that by far the most effective way to deliver funds back to the city and to get the most bang for the buck, so to speak, it is a winner that we will probably never see again, is revenue sharing. It cost you nothing to deliver it back. It did not have a huge bureaucracy to take care of it. You gave us funds that are our local funds that we sent to you and that you sent back to us, and we allocated those here where our citizens in the cities and the states said this is where our money should be spent.

There is no question that it costs less to deliver. We get more bang for the buck, as I said before, on what we spend it on, and it is by far the most economical way to do it.

Now, having said that, that does not address the bridge problems, street problems, et cetera. But if you look at most of the elected officials throughout this country, I think the pressure at home will make those things happen anyway. If we have a bridge go out, like North Main went out, the Pafford Street overpass, we had $1.5 million go into that facility. We all know that when it went out, we took care of it and had to spend some reserve dollars to do it. This will happen to the bridges that the commissioner is talking about. It will happen to the roads. It will happen to the other areas. So we prioritize those funds, but there is no question it is the cheapest way to get dollars into Washington, and you are certainly the most effective tax collecting entity that we have. You have ways that we do not have at home, as you well know. And at the same time you can send them back without having all the constraints and the staff for us at both ends to decide what we can and cannot do with it, and yet I feel, frankly, unfortunately, that probably the one chance of getting any federal funds that we will see again—not in my lifetime.

Mr. GEREN. Would anybody like to add to that?

Mr. JOHNSON. No, I will just ditto what the mayor has said as far as revenue sharing. Before becoming a member of the Tarrant County Commissioners Court, I served as a mayor for six years. And I think those dollars that we received from the federal government through the state on revenue sharing was one of the most effective dollars we got. We did not have to have a staff to use that money. The limits of what could be spent on was not that great. We could, we did have some flexibility to help the people that truly sent the money to Washington to begin with. I think if something could be restored and some money funneled back to the cities through this program, I think it would be very beneficial to us.

Ms. BAGSBY. That whole procedure simply gives people ownership of their government and of their various projects. It makes them participatory in democracy, and it was just a boom to this area when it was available to us. It's certainly something that we would love to see restored. I agree with the major. But we probably would not see that happen. But there needs to be some formula set up whereby citizens believe that the dollars that they send to Washington will come back to them for needed projects locally.

We simply here in this area, be it county or city, we have taxed our people to the limit, even for good projects, good reasons. There simply is a point of no return and I am afraid we have reached it.

Mr. JOHNSON. One other thing, Congressman, if I could touch on too is the Community Development Block Grant funding that we receive here in Tarrant County. And we have a coalition of all the mayors of this county, 37 cities participate in the CDBG program, and I was chairman of Tarrant County Mayor's Council one year. I served very actively with that group for the six years that I was mayor. And I have seen that CDBG program dwindling on an annual basis.

And quite frankly, when you talk about infrastructures, streets, roads, waters and sewers and different things that that money can be spent on, if you would go back and look at the programs that have been established in all the cities that have participated in Tarrant County, you will see what good it is doing with the dollars through grants like this. And I would like for you to maybe take a look at the CDBG program to see if there is some way we might turn that train around and get it going back to at least the level that we had it maybe eight or ten years ago.

Mr. Bolen. Congressman, there is one other funding source that does not cost the federal government one nickel that we have asked for over and over again from the League, that we know in Texas is prejudiced against us and the amazing part is that we find that the balance for almost every state in America it is a benefit to, and that is the Bella Hetch Bill. In Texas, that is $350 million, roughly, that we compete against your local merchants, those in Lafayette, Louisiana, those in California, that we compete against outside, out-of-state firms that are sending merchandise into our area, not taxed, which means that we pay more to buy locally than we do out of state, and we are not collecting those funds at all. It is unfair to the local business people in every community across this country.

In our particular state, and every state league that I talk to, I looked the figures up, Texas is $350 million. When I was in Lafayette, I forgot that number, but it is a substantial amount. And as you know, Congressman Geren, our state legislature fought for three sessions over $450 million for the education bill, and they had a large amount of it in this particular funding source that we do not collect at all.

Now, Congressman Brooks from Beaumont is chairman of that subcommittee. We would like any help we can get to persuade him to put that onto the floor. And I have talked to him in the past. It is one that—that money is available. It does not cost you in the Congress one cent. It belongs to the citizens of the state that they buy from and we are entitled to that if we can get it. We would like your help.

Mr. Johnson. I might add one other thing, since we are on our laundry list and, Your Honor, you will be receiving some information from me rather shortly. But the arbitrage that is now collected and sent back to Washington, if you will, to the Internal Revenue Service for bonds that we sell, we being the governmental bodies, there is some way that we need to get exempted from that arbitrage law of the IRS so that we can use that arbitrage money on a local basis where the money is actually being collected from.

And I think that I understand the reason for the arbitrage law. It was primarily, though, I think to keep private business and industries from getting tax-free bonds and getting into selling those bonds and collecting the arbitrage and using it for whatever they might. But I can assure you that the arbitrage money can be used here on a local level. And if we could get some type of IRS exemption on that particular loss, so that we could use that money locally, that is something I wish you would consider and look at.

Mr. **Geren**. Thank you very much.

The **Chairman**. Congressman Jimmy Hayes.

Mr. **Hayes**. I really do not want to ask much, not for lack of interest, but there are so many issues here that affect Congressman Geren, which he has a much broader range of working, the reverse being true yesterday. There is one thing I do want to ask, though, while I have you, and it happens to be the only question I do want to ask.

The Corps of Engineers, which is testifying later, has got a cost/benefit ratio whenever it does projects. What would you think if our committee started exploring the idea of priorities based in communities on cost/benefit for projects that traditionally do not fall within the corps, but instead, give ranking for need among federal legislation that we might pass with incentives to communities and where the priorities are created by the community, but where those with the highest cost/benefit ratios could therefore compete for the betterment of the country as a whole?

How do you think your county and city would view that kind of mechanism which you compete with constantly presently on the Corps of Engineer projects?

Mr. **Bolen**. Congressman, I think it is a good idea. We have to do it ourself. We do it all the time. But we would like to have input into the process. We would like for you to hear from the local entity, of course, what we think the priorities are and how they run up and down the ladder. I think it is a good way to do things.

I know in our highway system, through the past two or three chairmen, they have almost got it to a point today where they get dedicated right of way on large portions of those highways that they have, and they did that on a cost-plus and a cost-per-mile basis.

We try and do it ourself. I think it is the only fair way to allocate it as long as we have input into the system.

Mr. **Hayes**. Right. Well, I meant they would come from you, and, of course, it would have to come with a degree of oversight for you. Maglev, I see you have got something there about high-speed rail here. Maglev, Dallas/Fort Worth is ingenious. The cost/benefit of that, I think, could be viable only possibly by Los Angeles hooking into the Midwest—rather, Far West. Midwest to them is anything in Nevada. But those are the kind of inventive things we are going to have to do.

And the only other question I would ask, you mentioned earlier some of the problems that you are dealing with in water quality and some of the problems you are dealing with. One of you mentioned asbestos which is a huge problem in Houston, it is a huge problem in construction here, a higher problem where I am from.

What would you think of also prioritizing the health risks, because all buildings are not equal, and all construction is not equal, all the buildings are not suffering under RTC-administered properties, completing in the open market. And the FIFA dollars that take away some of these other better projects are because, in part, because of the funds that are going toward the bailout. What do you think of exempting RTC properties in some cases from these asbestos replacement laws in order to increase the management of that collateral at no taxpayer cost and knock down the bailout cost?

Mr. Bolen. Well, I had not heard that proposal before, but I——

Mr. Hayes. Neither has Congress, but they are going to. [Laughter.]

Mr. Bolen. I had an experience with asbestos personally a year ago, where my kids and I laid asbestos tile 20 years ago by ourselves on our hands and knees doing it, and we took it up. I laid it for next to nothing. It cost me $130,000 to remove it, and then throw it in the trash and then tear the building down. Now if that makes sense, then somebody knows something I do not know. But these are the kind of regs that we are confronted with. And if we could exclude those, prioritize them out, some other way to do that, I would certainly look favorably at that.

Mr. Hayes. Because it costs million of dollars for different programs and environmentally, as I say, all buildings are not the same. I used to be in construction. There are some that should not be allowed to qualify, and there are others that have such incredibly low levels.

Just give that some thought and especially in the future in your opportunities with the League and their activities.

Mr. Bolen. I appreciate that very much.

The Chairman. Mayor Bolen, you referred in your remarks to passenger facility charges, a proposal supported by both the Republican Administration and most of our Committee Democrats. You might be pleased to know that legislation allowing local airports to impose the PFCs was passed by the House just last Thursday, and I know that it could benefit you here. So it looks like it is on its way.

Mr. Bolen. We have followed that, Congressman Anderson. We certainly appreciate your support of that, because you can rest assured it will be used at DFW.

The Chairman. Very good. I think that is it.

Mr. Bolen. Thank you very, very much, Mr. Chairman. Congressmen Geren, thank you very much for bringing the panel to Fort Worth.

Mr. Geren. Thank every one of you for making the time to be with us today, the time I know that went in in preparing your remarks. Your input will be very valuable as the committee continues its deliberations of these important problems. Thank each of you.

The Chairman. Our next panel consists of Chamber of Commerce representatives: Mr. Terry Ryan, President of the Fort Worth Chamber of Commerce; Mr. Jerome Mosman, Executive Director of the Fort Worth Hispanic Chamber of Commerce; and, Mr. Ralph Mason, President of the Metropolitan Black Chamber of Commerce.

Would you all please be seated?

I will recognize you, but you might as well do it the way I introduced you or choose from among yourself: Terry Ryan, Jerome Mosman and Ralph Mason, in that order. You can reverse it if you wish.

[The prepared statement of Mr. Johnson appears on p. 958.]

[The prepared statement of Ms. Bagsby appears on p. 952.]

TESTIMONY OF TERRY RYAN, PRESIDENT, FORT WORTH CHAMBER OF COMMERCE; JEROME MOSMAN, EXECUTIVE DIRECTOR, FORT WORTH HISPANIC CHAMBER OF COMMERCE; AND RALPH MASON, PRESIDENT, METROPOLITAN BLACK CHAMBER OF COMMERCE

Mr. RYAN. Thank you, Chairman Anderson. My name is Terry Ryan. I am President and CEO of the Fort Worth Chamber of Commerce. And on behalf of the Chamber here, I would like to say welcome to Fort Worth. We are delighted to have you here, and I hope you enjoy some of our hot weather. This is the hottest part of the year for us, and I hope you enjoy it.

And, Congressman Hayes, we are glad to have you here from our neighboring state. As always, Congressman, Geren, welcome back home as always.

In accordance with your instructions, we did pass out written comments about the impact of infrastructure on the nation's productivity, economic growth and competitiveness. Consequently, I will keep my verbal remarks as short as possible within the time frame.

If you think back 200 years, rivers, lakes and seaports determined our commerce centers and lines of distribution. One hundred years ago, it was the railroads. Today, it is our airports and our highways.

Infrastructure investments have historically virtually contributed to our nation's economic growth and well-being. Recent economic research has tied the level of public infrastructure spending—federal, state and local—to the productivity growth rate in the private sector. However, during the last 20 years our public works have been shortchanged, in our opinion. Many economists feel this underinvestment and slow growth rate of our productivity means trouble head as other nations surpass us.

Communities face similar problems. When corporations consider cities for relocation, infrastructure is an important factor. And as an aside, one of our most critical activities, if not the singular most critical activity of the Fort Worth Chamber, is economic development, and we talk with people constantly concerning relation and infrastructure. In the new site selection, for instance, for the U.S. Bureau of Engraving and Printing, the Western Currency Plant, the DFW International Airport played a most critical role. The expansion of this airport, in our estimation, is the most important economic issue facing the Fort Worth/Dallas area today.

Another example of the benefits of infrastructure improvement is the Fort Worth Alliance Airport which has attracted the American Airlines maintenance base at Fort Worth and thousands of news incumbent to that particular project. This industrial airport is expected to draw many corporations to the Fort Worth community, thousands of new jobs in this area. And no matter where I have gone in the United States, that particular airport and what we can do is a subject of great interest.

Accessibility, whether it be through airports or highways, is one of the most important criteria for the location of businesses any place in the United States. For example, the Woodhaven area, for all practical purposes, was isolated by inaccessibility some years ago. Opening the highway interchange access with bridges and ramps on I-30 in the area spurred a resurgence of development which reversed the decline, and since has added jobs and improved the quality of life for literally thousands of people in that area, and businesses.

What we see for the future of Fort Worth and Tarrant County, in terms of serious and important needs to the economic development of this area of better than 1 million people in the Tarrant County area and certainly the four plus million people in the whole metroplex are several things that we would prioritize as the most important.

First of all is the expansion of the runways and taxi systems at the DFW International Airport, which will impact, it will not only be good for our own, frankly, selfish and important economic development purposes, but it impacts the entire United States air system. And the improvement of that particular airport helps each and every one of us, including people in your states and businesses in your states, as well as the safety.

Expansion of portions of I-30, our east/west freeway, portions of I-20, our other east/west freeway down south of here, portions of I-35, what we call the airport freeway which is State Highway 121, and critical is the State Highway 287 from Dallas/Fort Worth and the extension of 360 to the Superconducting Supercollider project which, again, will be beneficial not only to people in this part of the world, but people from all over the country.

And finally, the construction and development of a high-speed rail system within the state of Texas, we think is a matter of important concern to all of us, connecting five of the six major cities and encompassing the bulk of the 17 million citizens of Texas.

Each dollar invested in infrastructure is returned many times over. As taxpayers experience an increase in net taxes paid, they look for a return on their investment, as you are well aware. Spending on infrastructure, as it creates jobs and services, provides a high yield on that investment. It promotes the work ethic rather than the handout programs.

We would encourage you strongly to continue your efforts and the improvements of our infrastructure and applaud your efforts in this singular work, and we thank you for coming to Fort Worth and listening to some of our concerns.

Thank you.

Mr. **MOSMAN**. I am Jerome Mosman. I am Executive Director at the Hispanic Chamber of Commerce. Mr. Frank Gomez was supposed to be here today and he broke his leg Sunday. He is okay, but he is not getting around real well, so he asked me to come on his behalf.

I think I am supposed to talk in Spanish, right? So people ask me why are you working with the Hispanic Chamber, so then I start talking in Spanish and then they say, oh, okay, you can work for the Hispanic Chamber.

The Hispanic Chamber is a small one. Pete Geren is a member and knows it is about 300 small businesses, 17 corporate sponsors. It is one of the oldest Hispanic chambers in the state of Texas. It dates back to 1973.

I submitted some comments, Frank's comments to you, and I am going to go over just two or three of those items in the interest of time.

Speaking of economic development and the spending of federal dollars, as a minority chamber we have to mention, too, the fact that the DFW Airport and Carswell Air Force Base and a number of other entities that spend federal funds are consistently failing to reach the guidelines for including minority businesses. They are saying they are making good efforts and all the rest, but you need to be very aware that they are not succeeding. Minority businesses are—it is not dwindling down to the smaller businesses, and this is really sad, because economic development should be area wide. It should be inclusive and not exclusive.

The major roadblocks for minority businesses, you may have heard this but it needs to be said over until someone does something, is the size of the projects. The contracts are so large it rules out a priori any small or minority businesses bidding on them.

And the second thing that small businesses run into is bonding, of course, the strict federal bonding requirements. We are recommending that you break down large federal contracts for any federal projects into smaller units; and secondly, we recommend that you create a federal bonding pool or at least relax bonding requirements so that minority businesses may be included.

The second issue, you asked earlier, what was being successful, a successful expenditure of federal funds. CDBG, Community Development Block Grant Funds are very successful and you need to know that. We as a Hispanic Chamber have administered a CDBG economic development project for ten years. In the last six months, we have run into some serious difficulties, and it seems HUD is trying to actively discourage the expenditure of CDBG funds on economic development, and they are doing this by requiring impossible documentation. It is not fair, of course, but you need to know what they are doing.

For job retention, what they are asking us to do is to prove that this business is going under in a sense that it has already filed bankruptcy, or that it has operated in the red for years and we need their IRS statements to prove that. It seems we can help a business if it is already completely collapsed. But a business that is struggling or the year before it files bankruptcy, we cannot do anything to help them.

Number two, what they are requiring for job creation for low and moderate income people, they are requiring that any new job created, that the person who takes that job must tell us the number of people in his or her family, the income of every person in that family, and they must sign onto that and swear to that and submit that private and confidential information to us through their employer. Well, that is not going to go over with either employers or new employees.

Those are almost impossible, two impossible things they are asking of economic development projects right now.

Obviously, we applaud the intention of the law is to create new jobs for low and moderate income people or retain jobs. What we are recommending is, since 80 percent of small businesses fail in the first five years, and since businesses that fail in depressed areas are probably not going to be replaced. You know, that place is going to remain vacant. Another business is not going to go in there. A banker will tell me, we will not make loans to people to locate in a place where a business has already gone under. We do ont normally do that. It is a bad sign if a business went under there. So depressed areas get more and more depressed.

What we are recommending is that CDBG funds in economic development projects be extended to any small businesses in their first five years of existence, or any small businesses located in depressed areas.

And concerning new jobs, since they are types of jobs that are normally held by low and moderate income persons, we recommend that simply a list or categories of jobs that are normally held by low and moderate income, that this suffice. That if we are creating more waitresses' jobs, we do not have to prove that the lady who or man who took that job was low and moderate income. If he or she went to work for $3.80 an hour, we presume that that was a job created, a new job created for a low and moderate income person. So just the type of jobs should be sufficient without invading people's privacy or seeking confidential disclosures of their size and family and income of every person.

The final remark I would make would be about air pollution. I have lived in Dallas/Fort Worth for over five years, well, seven years now, and I have seen the air consistently get worse. I would encourage the federal government to more actively encourage the use of natural gas and especially public vehicles, trucks, buses, anyone with a large number of vehicles. There may be, and I do not know about it, federal incentives or federal tax credits or awards or something for people who do these things, who switch over to natural gas. But I would encourage that there be more done in that area.

Thank you.

The **CHAIRMAN**. Mr. Mason.

Mr. **MASON**. My name is Ralph Mason. I am President of the Fort Worth Metropolitan Black Chamber of Commerce. I would like to thank you for inviting me here today.

First of all, I do want to echo the concerns from the Black Chamber that minority participation in contracts is a very key area to the economic development of all Americans; that we have a viable minority contracting services. And I think Jerry spoke to that quite well.

However, today I probably want to limit my comments to a particular area of why public works in one sense. You have gathered a very respected panel of people to tell you what is wrong, but I want to focus on maybe why we should correct those things and what is our philosophy with respect to it.

I guess I am more concerned about the connection between infrastructure development and human capital development. As an analogy, I would submit to you that infrastructure development and human capital development appear to me to work together pretty much the same way the muscles and the skeleton of the body works. Muscles hang onto the body or the infrastructure of bones to work, to flex, to be able to produce power.

Well, the same thing, to me, kind of goes along with infrastructure and human capital development. That there is a connection between the two, that the muscles of our society, the human workers, need good infrastructure. But they are there for the muscles; that infrastructure there is there for the workers, I think.

In the past, when the muscles of our society did work, we had things like the great industrial development and wars to spurn them on. I think when we reached the time of the depression, it was the Public Works Department that came to make the connection between workers and infrastructure. We did not build libraries and roads and bridges just to have them. We also built them to put people to work.

I think today in America we are pretty much back to that need again. From the Black Chamber's perspective, the development of enterprise zones to stimulate job opportunities, to stabilize housing in neighborhoods is a critical need in the community. Our central cities represent a sink hole, not only in terms of streets and bridges, but also in terms of human lives. The paradox of the central city is that it decays while it is seemingly great economic development occurring.

Here in the metroplex, the North Texas Commission reported 448,000 jobs were lost in the metroplex by companies employing 100 or more employees. The good news was that 542,000 new jobs came in companies employing less than 100. Unfortunately for the central cities, those jobs went to the suburbs, where the new developments were occurring. The problem is that a vast majority of the business starts were in the suburbs.

What scares me about these statistics, if we understand the importance of public work in the 1930s when there was only 17 percent unemployment, you should understand that in the central cities, such as Fort Worth, over the last five years it has been 20 percent unemployment. And in some key areas, some demographically key areas, such as black males 18 to 54, there has been 25 percent unemployment.

Leading economists such as William Wilson have concluded that the struggle for economic development will be the leading fight for minorities for the 1990s. The growth of manufacturing, retail and wholesale trade in the suburb areas, the flight of affluent families to the suburbs and the decline of the central tax base have made it an increasingly more difficult to stimulate growth in the central cities, where there is infrastructure economic development.

My point is that what good is it to have well-constructed roads in our neighborhoods if people can't ride them to work? What good is it to build bridges between central cities and suburbs where jobs are abundant if there are no mass transit to move people to jobs?

There is a need to stabilize housing. We feel that economic development helps to stabilize housing. We feel that infrastructure development can lead to that.

What is it then that I want to see from the attempt to rebuild our communities as a philosophy in terms of getting about the business?

Rebuilding efforts should focus on projects in economically-deprived areas such as enterprise zones where historically unemployed and underemployed people can not only gain jobs but new skills. Contractors working on projects should have goals and/or incentives for hiring and training underemployed and unemployed persons. Rebuilding projects should focus on private home development to stabilize neighborhoods where possible. Rebuilding efforts should include incentives for attracting businesses to economically deprived areas in order that once the building is completed there will be jobs for those that live in the area. Rebuilding efforts should include incentives to local governments for mass transit plans that are specifically designed to move workers to areas where opportunities for jobs are.

Thank you very much.

The **Chairman**. Well, thank you, Mr. Mason.

First, to the panel, I want to thank you. Your statements have been most interesting. And when we use the words "productivity, growth and competitiveness," we think of concepts and not realities. Now, given your practical business experience, what do you think these words mean as applied to infrastructure and the daily operations of the business community in this area?

Do you have any comments you want to make on that?

Mr. **Ryan**. Well, if I may just make a quick response to that question, Mr. Chairman, it seems to me that the productivity is somewhat of an arithmetic ratio such as how much does it cost to build that bridge, how much does it cost to refurnish, redo, redevelop a particular portion of the city or its highways or whatever the public works project might be relative to what you can gain out of it over a period of time.

And it seems to me that it is not a—at least I do not believe it is a rocket science type of question. I think it really is a matter of applying a business approach, a business technique for any one of us, if you or I were to be running a business, is it worth investing $500,000, a million or whatever it may be into a given project relative to what we expect to get out of that. That is a cost/benefit ratio, and I think Representative Hayes was alluding to that earlier.

Secondly, I think it is a matter of how much of our public funds do we put into a project and how efficiently can we get them to produce the finished result. And again, that, to me, would be productivity relative to putting the project itself together.

The **Chairman**. Would anyone else like to make a comment?

Mr. **Mosman**. I would add a support of what Ralph Mason has mentioned, that productivity needs to be seen in human terms, too. Who are the workers for this project, and what minority businesses will be included in this economic development picture?

Economic development is—right now it is difficult. I was told that a number of former prime contractors are now subcontractors. And so the minority subcontractors are really competing with former prime contractors. So the picture in a number of areas is difficult, and productivity is—the competition is very strong. And when competition is strong, it seems people go out for themselves and the other people can join later, if possible.

I think the federal government needs to ensure fairness that the productivity is spread evenly, and that it benefits everyone.

Mr. **Mason**. I think dealing with the terms of difference between the concept and reality, public works is not just for public works. It is for human beings. And the reality is that until we develop public works at tend to solve some of the other problems going on, at least try to deal with them. No one says that you can solve them all from one perspective such as this. But you can certainly have an impact upon the issues of jobs and economic development.

I heard it once said that a good job can even solve mental illness sometimes, and I believe that. That people when they are out there in the streets without money have a lot of things going on. Particularly in this area, I use the term incentives from your group, and I mean that specifically, because what is going on in the last ten years is chambers such as myself beat up on mayors like Bolen, to tell him that we need tax incentives for economic development zones. And the irony of that he and I both know that this is already the lowest tax base in the city. How much more money can you give away with it?

So we need you to provide the incentives that bring businesses back to this type of infrastructure, this type of economic development that we are looking for. And I believe that—and my concern is now can the Army Crops of Engineers properly factor in the cost and productivity of a project unless you include what is the benefit and return to the local area when you employ somebody?

You know, it is $5.00 spent on the project, but maybe only $5.00 spent to keep somebody off of welfare, and that is the type of reality I would like to see put into it. It is not just buildings. It is people.

The CHAIRMAN. Let me ask my question a little bit different.

Do you believe a better infrastructure would result in a stronger economy for this area?

Mr. RYAN. I do not think there is any question that it would, and I think——

The CHAIRMAN. You mean you think it would?

Mr. RYAN. I think a better infrastructure is absolutely critical to greater economic health and productivity in any community. If you cannot get from your home to your place of work because of a poor infrastructure, that is bad for the economic health of not only you, but of your neighborhood and of the rest of the city, because the city, it seems to me, Mr. Chairman, has got to operate in a fashion where all parts of the city—you are only as good as your weakest link. So all parts of the city have got to have an appropriate water system and appropriate water treatment plant and appropriate this, that and the other thing.

One thing we have done here in Fort Worth, and you asked this question earlier, and that is, what are we going to do here in Fort Worth. It seems to me that our city has, and some of our political leaders have taken some pretty tough heat because we have a very high tax rate in certain areas of our taxing arena. And the reason for that is, is that we have taken funds and put them out and built water treatment plants. The things that we are dealing with are not terribly exotic and have a great sex appeal, but is, as I think Ralph beautifully put, without the skeleton, nothing else works.

So it seems to me that if we do not have a good bus system or transportation system and all the other things that go with it, and we in Fort Worth have taxed ourselves to produce those kinds of infrastructure where many of our sister cities in this whole general area have not done that. They have maybe a higher bond rating, but in the long run I think it will be the better part of political wisdom.

And on this bonding issue that Jerry has mentioned, this is an area where again this city, the private sector, the three chambers are working very closely on this, on how you get bonds to contractors to work on these specific projects, whether it is Alliance Airport or whether it is DFW or whether it is a city thing. And I would applaud their comments, because I think they are very pertinent to the health and welfare of the infrastructure, generated by a strong infrastructure.

Mr. **Mosman**. I would also say the infrastructure is essential. You are not going to have much growth of any kind, you are going to have a decline if the infrastructure is not strong.

The strongest part of the infrastructure I see in this locality is its water. Fort Worth has well planned into many years in the future water supply which in Texas, in the heat and dryness, that that is a real crucial item for the future. Its weakest area I see is transportation, and the problem with that I see is municipalities not cooperating. And I think the federal government is going to have to—I know there is cities studying regional plans and area plans, but it seems mass transportation or mass transit is going to be left to first come, first serve. And when Dallas gets theirs put in place, everybody is going to have to link up to their kind of rail, because they were first in the area. So if you want to link Denton and the superconducting supercollider and Dallas/Fort Worth, you are going to have to use a pre-existing plan.

I think there needs to be more creativity and more encouragement from the federal level to come up with area plans of transportation that include all these suburbs where all these jobs are located, where many jobs are located, and without the transportation to those jobs they do not really reach a large portion of the population, especially the low and moderate income.

The **Chairman**. Mr. Mason.

Mr. **Mason**. Yes, the infrastructure is very good in the general sense, but it should also be thought of in terms of what direction sometimes can have a different impact. By that I mean if all we do is continue to build let us say a perimeter around the city and have this doughnut hole in the middle, then that type of infrastructure has its impact on certain groups, and that bothers me.

I want streets to go both ways, and not just away from the city, and that is what I am saying.

The **Chairman**. Pete.

Mr. **Geren**. Thank you, Mr. Chairman.

I want to thank Jerry and Ralph for participating today, and please give my regards to Frank. I am sorry to hear about his accident. I hope it is not too serious. You are smiling. It must not be too serious.

Mr. **Mosman**. No, it was not. He was playing baseball.

Mr. **Geren**. He is too old to be playing baseball. Tell him that.

I appreciate very much your participating and the time that you spent preparing for this. Terry has identified the needs we have as a transportation center, and certainly that our future transportation center is key to the whole future of this area.

The CHAIRMAN. How old is too old to play baseball? [Laughter.] You said he is too old. I am not too old. I bet I am older than he is.

Mr. GEREN. Frank is 12 years older than you are, Mr. Chairman. [Laughter.]

The CHAIRMAN. I doubt that.

Mr. GEREN. But both Jerry and Ralph dealt with the inner city. Ralph referred to it as the hole with the doughnut. And what we are seeing happening in our area, what has happened in other parts of the country before the problems had reached us, because they are older than us, and we do have some special needs in some of these older areas to attract the business, to bring jobs back into them, to improve the public safety, to help rejuvenate what were formerly the most vibrant parts of the city and parts where they are already hooked up to sewage. They are already hooked up to utilities. There is a lot of good reasons, in addition to the very important considerations, to try to rebuild these intercity areas and to bring life back into them. And it is a strong personal interest of mine and I have been working with a number of representatives of each of your organizations in that area.

As we develop, as the Chairman said, we are trying to make this decade the decade of infrastructure in this country, and trying to put together a large bill that is going to try to be comprehensive and try to see infrastructure as more than just roads, bridges and runways. We would like to be a partner in the effort to try to breathe life back into some of these older areas, be a partner with those who are trying to bring businesses back into them, bring jobs back into them and breathe new life back into them.

If each of you were to prioritize a number of the subjects that you have addressed earlier in your testimony for us as we try to develop this comprehensive bill, what do you think would be the most important considerations for us to put into that bill if we are going to be a good partner in the effort to address the concerns that each of you raised?

Mr. MASON. I will start with mass transit, the focus of getting people to those jobs. Two, economic development of the disadvantaged zones. They have already been identified in the states. These areas are well known as to where underemployment are rampant and things and the decay of those areas that the stimulation of business in those areas by whatever incentive is necessary. And I think from the business flows the jobs and from the jobs flow housing. And whatever impact, and I am not sure it could have on housing. You know, it has been deplorable, the fall of housing in these areas over the last 25 years. All we have is Community Reinvestment Acts, but then we say, well, let the community enforce it. The government kind of throws their hands off that one. The housing and things like that have deteriorated badly. And whatever you can do to impact those three areas, I would certainly appreciate.

Mr. GEREN. Thank you.

Mr. MOSMAN. I would say the key is some kind of built in job creation and job retention plans in whatever spending of funds happen, because the person who has the job can afford the home, can make his mortgage payments or can even purchase one of the HUD homes that sits there vacant.

The second thing would be that the economic development somehow be broken up into small enough units that small businesses, businesses that may not deal in millions and millions of dollars, that many small businesses can participate and feel a part of the project, of this economic revitalization.

Mr. **Geren**. Thank you.

Mr. **Ryan**. Well, I think relative to our area, and I am trying to answer your question narrowly, Pete, because I think they have responded in an appropriate fashion about certain other needs. It seems to me in this area the overwhelming number one priority from an infrastructure relative to our economic development is to ensure that we get those runways expanded at DFW. I mean, I just think without that we will stagnate not in the next five or ten years, certainly not in my adult lifetime, but in our children's lifetime. And I think it is important to the future of our children that that airport be expanded as well as for a lot of other reasons which we have discussed.

I do think also the second probably most important thing, and I am not familiar with the financing of it, but public transportation is a critical need here and in every other city that I can think of in the western United States, if not in the eastern United States. And I think those two infrastructure items relative to highways are the most important priorities that we have.

And then, thirdly, I would say intercity travel from a strictly infrastructure type of approach would be the third most important priority.

Relative to what Jerry commented on about this problem with subcontracting, that is a problem that I think, as I say, we are actively working on today. We have got a task force which is made up of—which one of my staff people heads and which is made up of participants from our three chambers, and that is something we have got to bring to your attention to make sure that when these infrastructure efforts and projects are put into place, hopefully under your bill, that in fact that the benefits are distributed equitably and that small businesses of all types of ethnic, racial and backgrounds participate in based on qualifications.

Mr. **Geren**. Thank you very much. I appreciate each of you taking the time to be here today.

The **Chairman**. Congressman Jimmy Hayes.

Mr. **Hayes**. Because of time constraints, I will not ask any questions, but I would ask that the record reflect that Nolan Ryan and I are the same age. [Laughter.]

Mr. **Geren**. Again, Jerry, Ralph and Terry, I appreciate very much your being here.

Mr. **Mosman**. Thank you very much.

Mr. **Geren**. This is a great opportunity for us to have input, as I mentioned in the introduction, the people who will be the architect of the infrastructure policy for our country over the coming years, and I appreciate your making the time to share your experience and your insights with us. Thank you so much.

The **Chairman**. Our third panel, we have Mr. Jack Sasser, Deputy Regional Administrator of the Federal Aviation Administration's Southwest Region headquarters; Mr. Oris Dunham, Executive Director of the Fort Worth Airport; and Mr. Hershel Payne, Board of Directors of the Texas High-Speed Rail Authority.

Mr. Sasser, do you want to start?

[The prepared statement of Mr. Ryan appears on p. 979.]

[The prepared statement of Mr. Mosman appears on p. 963.]

[The prepared statement of Mr. Mason appears on p. 960.]

TESTIMONY OF JACK SASSER, DEPUTY REGIONAL ADMINISTRATOR, FEDERAL AVIATION ADMINISTRATION'S SOUTHWEST REGION; ORIS DUNHAM, EXECUTIVE DIRECTOR, FORT WORTH AIRPORT; AND HERSHEL PAYNE, BOARD OF DIRECTORS, TEXAS HIGH-SPEED RAIL AUTHORITY

Mr. Sasser. Thank you, Mr. Chairman, Congressman Geren, Congressman Hayes. We do sincerely appreciate this opportunity. We do not get these very often, especially in Fort Worth.

As you are probably aware, the Federal Aviation Administration looks at aviation on a system-wide basis. That is to say, we consider the airspace system, our system of airports, navigational aids, security, aircraft, airmen and anything else that has to do with aeronautics.

The national system is dependent on an interrelated state, regional and local system. It is comprised of many smaller systems all fitting together in concert to form a total national system. In the Dallas/Fort Worth metroplex, our system revolves around the Dallas/Fort Worth International Airport. To a large extent, even the economic system of this area revolves around this airport. I believe virtually every presenter prior to me has mentioned the DFW airport as well as the Alliance Airport.

Our current plan for the DFW area is called the metroplex plan within the FAA. This plan not only involves the local system but the impact of all of the other major systems throughout the country. Anything that affects DFW affects the national system. For example, if we have bad weather at DFW for a period of about six hours on any given day, after the completion of only one of the runways that you have heard about today and including a 13 percent anticipated increase in traffic, delays across the entire nation will increase by 16 percent. That is a total impact of DFW on the national system. It is a very significant piece of the total picture. The metroplex plan was developed by the FAA Southwest Region in 1987, in an attempt to deal with growing demand and provide capacity increases necessary to accommodate aeronautical activity in the twenty-first century. It has been revised and expanded several times since then. Currently, some of the components of the metroplex plan include: Relocation of the four cornerpost navigational aids that serve this metropolitan area; installation of two additional VORTACs, navigational aids to serve just the DFW metroplex; construction of two additional air traffic control towers at Dallas/Fort Worth International Airport; significant expansion of the existing terminal radar approach control facility; installation and upgrade of the existing radar system to include a total of four radar sensors, that is two new ones, two additional ones; extension of the two existing runways, and you heard Mr. Ryan from the Chamber of Commerce mention those; construction of two new runways, he also mentioned that; four new instrument landing systems with associated approach lighting systems.

Our metroplex plan also considers all other parts of the airspace/airport system for a nine-county area which includes the counties of Dallas, Tarrant, Parker, Ellis, Johnson, Rockwell, Denton, Collin, and Wise Counties. There are 245 airports in those nine counties, of which 46 are open to the public. One hundred and ninety-nine are privately owned, restricted use, and that includes heliports at the hospitals.

The other air carrier airport in this metroplex is Dallas Love Field. It has already begun rehabilitation of one runway and the other one is planned. We are in the process of constructing a replacement air traffic control tower at Love Field. I am sure you are familiar with the satellite air carrier airport study that was made public just a few days ago. The first phase, the feasibility phase, has just been completed by the North Central Texas Council of Governments. The second phase, which would include some sort of site-selection studies, is scheduled to begin soon. The Dallas/Fort Worth metroplex also includes two very unique types of facilities. One is the Garland Heliport. That is a new facility. It is now open and it is a unique facility found only in a very few major metropolitan areas in this country. The Fort Worth Alliance Airport, which you have heard of already, is unique unto itself in that it is the first industrial airport built from the ground up for that very purpose. You have recently read of the activity that is currently at this airport. It far exceeds our expectations and it represents a new concept in airports for added capacity, system relief and economic impetus for the metroplex, as well as the national. It also represents a unique funding mechanism, which I believe you might be interested in. It represents a partnership or an alliance between private funding, local funding, state funding and federal funding.

We estimate the total aviation needs of the metroplex to be somewhere in excess of $150 million for the next ten years. Any possible new air carrier airport would be in addition to that. Assuming continued legislation, and I noted with interest your comments, Mr. Chairman, on the PFC, passenger facility charge, is very encouraging to hear that. We would consider funding of approximately $120 million of this $150 million need. That does not include a new air carrier airport should that become necessary in the next ten years.

If that were to be a reality, you could add about a half a billion to $1 billion, depending on the economy at that time, for the initial phases of it.

Now the questions: What do we need to be doing today? Where are we going for tomorrow? And how do we get there?

We need capacity. We need the infrastructure to support that capacity. And the things that we think might get us on the road to that are such things as: Airport master plan updates, a continuous planning process for every airport in the area; land use plans with land set aside for industrial/economic benefits; noise and height zoning; environmental zoning even, something that has not been done to a great extent around the country yet; planning and building of the necessary infrastructure/construction to support new development at airports such as access roads, public transportation, high-speed rail, hotels, and available skills in the job market. We need coordinated overall metroplex planning with all agencies and all entities involved; and establishment of some joint oversight groups for specific functions such as environment, noise, height, airport development and industrial development.

We appreciate the opportunity. Thank you for coming to Fort Worth. We are happy to see you here.

The CHAIRMAN. Mr. Payne.

Mr. PAYNE. Chairman Anderson, Congressman Hayes, my good friend Pete, it is a pleasure to appear before you this afternoon. Although I am here today to talk about high-speed rail as a member of the board of directors of the Texas High-Speed Rail Authority, I would be remiss if I did not comment to Chairman Anderson that I also serve as chairman of the American Public Transit Association Governing Boards, a member of the legislative committee of that organization, a member of the board of directors of that organization, a member of the executive committee of that organization, and as such I have had the distinct pleasure of serving with your friends, Larry Jackson and Joe Brooks, and I know we all are unhappy and suffer at the untimely death of Joe Brooks, who was all our friend, and I know he was a personal friend of yours, and for that I give you my sympathy.

First, I would like to explain the work of the Texas High-Speed Rail Authority. It has been mentioned on a number of occasions here this afternoon. The Authority was created by the Texas Legislature in 1989. We have been in active operation since 1990. In late June of this year, we solicited letters of intent from groups wishing to apply for a franchise to design, construct, operate and finance a high-speed rail facility in Texas. Our application process will proceed with the issuance of a request for proposals for applications this fall. Applications will be accepted in early 1991, and a decision will be made on franchise applications in May or June of 1991.

The franchise will be fully funded from private sources. It seems rather strange that we are going to finance a $2.2 billion high-speed rail facility from Fort Worth/Dallas to Houston with total private funding and total private sources, but that is the program. There will be no state funding provided for this project.

Our agency has power of eminent domain which can be used on behalf of a franchisee, but all costs of the project will be borne by the private sector. Despite the absence of subsidy, two consortia, composed of American and international firms representing French and German rail systems respectively, are very interested in placing a system in Texas.

Again, I would be remiss without digressing for a moment to remind all of us where this country stood in the 1860s when we pioneered intercontinental rail transportation, and today we are having to go to Europe and Japan and Norway and the other countries to bring back the technology which we pioneered in this country.

Texas's topography in the region between the state's most populous areas is ideal for a high-speed rail system. The existing and projected patterns in air and highway traffic, coupled with the population projections for the near future, indicate that high-speed rail transportation could serve as a complementary mode to move people and goods in Texas. These and other reasons have attracted serious inquiries from internationally-respected corporations which seem eager to invest in this country and in this project. Given that a Texas high-speed rail facility will be a private venture, it will be up to the applicants to decide which cities will be served in their applications, and what technology they will use to offer these services.

The applicants' decisions on technology will be left to market considerations, since the financing will be purely private. The timing of their decision may preclude consideration of U.S. maglev technology, a matter of concern to those members of Congress currently interested in federal legislation to promote a domestic maglev industry. While our statutory franchise process may inhibit the application of U.S.-based maglev technology, please be assured that our invitation for high-speed rail project in Texas is completely open to any groups willing to propose construction of a maglev project.

In my opinion, the current discussions about the relative merits of rail-based and maglev systems overstates the importance of rolling stock in the decision to proceed with high-speed rail projects. Rolling stock costs account for a fraction of the overall costs of high-speed rail. The majority of the costs of a high-speed rail facility are in engineering and fixed system costs. These services and products will be provided for the consortia in Texas by local suppliers, contractors, and engineering firms to a large extent. Each of the two consortia who are bidding for this project have a number of local and United States corporations that are leading the consortia. I personally have discussed it with both the German and the French, and they have assured me that at least 90 percent of the project will be used in a "Buy America" type situation. The majority of jobs created, in both construction and operation, will benefit Texans.

Texas is also interested in the potential for licensees to manufacture rolling stock in our state. Given our fast application process, we hope to have an operational high-speed rail system by the end of this decade. Texas could then be poised to become a magnet for high-speed rail ancillary operations, which create jobs for our citizens. We must not forget that any kind of high-speed rail system, regardless of the technology of the rolling stock, has significant economic benefits to our citizens.

A high-speed rail facility would not only bring economic benefits in the creation of jobs; the addition of high-speed rail increases the capacity of the total intercity passenger transportation system, providing economic benefits to the travelling public. Current delays and congestion in the air and on our highways have discrete, definable economic costs. High-speed rail can meet some of the increasing travel demands of Texans into the next century, and diminish the overall societal costs of passenger transportation.

Congress has a monumental task in 1991; the reauthorization of the federal-aid highway program. I know this has been something that has been very dear to Congressman Anderson's heart for many years. Congressman, we appreciate your pioneering this and you have been a friend of transit for so many years that you and all of us who have been involved in the public transit industry take our hats off to you as we do every year. We appreciate and applaud you for that.

The **Chairman**. Thank you.

Mr. **Payne**. As the nation approaches the end of the interstate era, the federal government is faced with an opportunity to redefine its role in how it assists states in highway construction and maintenance. The growing problems of highway congestion, limited rights of way for highway expansion, and increasing pressure to limit automobile-related air pollution also lead to the reconsideration of the importance of public transportation providers in the federal program for surface transportation.

You have copies of my statement. I know you are running late. I will, therefore, cut this rather short.

The **Chairman**. It will all be in the record if you have given us your statements.

Mr. **Payne**. I have given the statement, Congressman Anderson, and you have the statement and know basically the considerations that we are looking for.

In summary, we commend this subcommittee for your interest in high-speed rail transportation. I encourage you to take actions to develop federal high-speed rail policies which benefit all high-speed rail technologies: steel wheel and maglev. We feel that high-speed rail technology such as may be proposed in Texas represents a significant step forward in passenger transportation from a consumer's standpoint. A successful franchisee will be offering transportation consumers a completely new choice, something no one in this country can provide now. Rail-based high-speed technology is misappropriately named as existing technology in this country. We must remember that nothing exists in this hemisphere that can be called high-speed rail.

Our board is committed to seeing that Texas is the first state to implement ground passenger service in excess of 150 miles an hour, should our review of the applications we expect prove that a franchise is in the public convenience and necessity. We look to the federal government to join us in facilitating this project.

Thank you very much, gentlemen. We appreciate your coming here to hear us.

The **Chairman**. Yes, Mr. Oris Dunham, the Executive Director, Dallas/Fort Worth International Airport.

Mr. **Dunham**. Thank you very much, Mr. Chairman. Thank you, members of the committee, for coming and letting us have an opportunity to speak to you on I know a subject of great interest to you, that is, the national infrastructure.

I am here today as Executive Director of the Dallas/Fort Worth International Airport and also as Chairman of the Airport Operators Council International, to support your continued efforts of that in all transportation modes. I would be foolish not to recognize right up front that there are many other modes of transportation and, of course, air is the one that we are vitally concerned with. And so I must make a few comments relative to air before I can talk about some of the other modes of transportation.

But the airports are of great importance and vital concern to the airport operators, and the capacity limits that we now are experiencing and delays at the various airports throughout the nation, we find that some of them are totally unacceptable, and we expect that in the future more and more airports, as I know you have heard, will become increasingly delayed as time goes on.

As the world's second busiest airport, we are fortunate to have one of the lowest delay factors and delay costs of any airport in the United States. This is primarily as a result of some very far-reaching and forward thinking by some of the people that live in this community and the federal government's participation some 20 years ago to acquire the amount of land that would enable us to build an airport with six runways.

However, our projections show that DFW's passenger traffic will double over the next 20 years. Aircraft operations will double to approximately 1.2 million flight operations a year during that period of time. And in order to accommodate that, we have set forward on a very ambitious plan that will cost some $3.5 billion in expansion monies.

As you heard earlier from our friends at the FAA, two new air carrier runways will be needed to allow us to accommodate both triple and quadruple instrument approaches during the IFR conditions at the airport.

American Airlines has on the drawing boards, and is just waiting for the runways to be approved, a new $1.2 billion terminal with 66 more gates for the airport.

With the infrastructure to support this expansion, it is not just runways and terminals. Other infrastructure that we need are such things as new control towers. One of the interesting things that this airport will have will actually be three control towers when we reach our final expansion. Really, we will operate the airport as two different airports, an east side and a west side, during the busy times of day, and only late at night will we go back into the main tower to operate the whole airport.

We need airspace which the FAA is working on to allow dual cornerpost approaches. We need highways and light rail to provide access to the airport. Roadways and additional parking at the airport are of vital concern. And, in fact, we are under construction now with an additional parking garage. That might surprise you when you look at the airport and find that we have 27,000 parking places already, but we find times that those are all full.

These improvements will all be needed to maintain the high level of service that we provide to the traveling public.

We feel that we need a balanced approach in the infrastructure improvements. Airspace is equally as important to us as the airfield and runways. The runways are equally as important to us as the terminal and the land side. And the land side needs mass transit and highways to get the passengers to and from the airport that will support the terminal development.

Without this balanced approach and the concurrent development of all of these sectors of the infrastructure, our ability to handle the traveling public in a method and a level of service that we feel is necessary for the citizens that own us will be greatly reduced.

In order to funds these improvements, I would just like to thank the members of the committee for their support of the last week's vote on the passenger facility charge. It is a vital and reasonable way to finance projects of great importance to the airport and enable us to expand in the areas that we do need for capacity enhancement. I believe that this is the only way that we will ever be able to fully provide the level of facilities that the airports have agreed upon with the FAA; some $50 billion over the next ten years.

But it is just not airport expansion that I feel is needed. The total transportation network, as I mentioned earlier, is necessary to enable us to provide the level of service at the airport. Since they all interact—you have heard about high-speed rail. If you go to Europe, you will find high-speed rail coming right into the basement of the airports. I think that is of vital concern. When airspace becomes your limiting factor, why should you take up airspace with an airplane that might seat 16 people when you could put somebody on a high-speed rail right out of the middle of the airport to some reasonable destination that they would reach as quickly, maybe quicker, by rail?

We feel that we have one of the greatest airports in the world. However, we look forward in the future to the additional improvements, better highways, better access and also rail access to the airport would provide.

Although, as I said, as executive director of the airport we are certainly concerned about aviation demands and requirements, we certainly support and strongly support the infrastructure that is needed for the other areas of transportation. Without them nobody could get to the airport. Our employees could not get to the airport, and we would be lost.

I would just like to thank you for your coming here, and I would be happy to answer any questions you might have.

The CHAIRMAN. Thank you.

If some portion of a new infrastructure program were allocated according to a benefit/cost ratio, would those projects measuring out as being the most beneficial, getting preferential treatment, how do you think that the aviation capacity or the aviation safety projects would do compared to highway or transit or sewage treatment projects?

Mr. DUNHAM. Well, I will start.

The CHAIRMAN. All right.

Mr. DUNHAM. I think if it is on a benefit, and you take into all considerations of the benefit, and that is, commerce within the United States as an international trading partner, not just for the person that is using the airways to fly on vacation, although tourism is one of our biggest national product, I believe, I think that we would rate very highly with the rest of them. I do not think that we would have to take a second class to anybody. Maybe sewage might come first.

The CHAIRMAN. I agree. I would think you should, but I am not sure that you would. I think it is kind of one of those questionable issues.

Anyone else like to comment?

Mr. SASSER. I think that maybe aviation would probably be a predictable answer for me. I think that aviation would rank highly. I would agree with Oris.

However, I would hasten to add that a transportation system that favors only one mode of transportation is very vulnerable.

And what I think we need in this country, as is needed and proven by many facts in other countries, is a balanced transportation system that does not favor a single mode. I think the public will decide where the favor is as far as which mode of transportation. But I think a balanced transportation system that offers the same opportunity to all modes of transportation is very, very key to the survival of many of the infrastructure problems that we have.

Mr. PAYNE. Public transit is not singular. It encompasses all modes of transportation. In the European Economic Community, the plan of transportation throughout Europe envisions using all modes of transportation: highway, high-speed rail, light rail and, of course, air.

As Oris has pointed out earlier, many of the people can go faster and be better accommodated by a combination of modes of transportation. They are not—a high-speed rail authority is certainly not going to put American Airlines out of business, nor is it going to put Southwest Airlines out of business. We are in the people-moving business. That is what this country needs is people moving with less environmental impact. The better we can do that, the better this entire country is.

I think, of course, sewers, who can argue with an improved sewer system in this country? But also, who can argue with the fact that this country moves on transit? And this country has become a more mobile country. Every year we are more mobile than we were the year before.

As Congressman Hayes pointed out, this morning you were in Louisiana and today you are in Fort Worth, Texas this afternoon. That could not have been possible. We move on transit, and we have to have a combination of all of the modes of transit.

The CHAIRMAN. Pete.

Mr. GEREN. Thank you, Mr. Chairman.

I want to thank this distinguished panel for putting the time in to prepare for this and appear here today. I have a number of questions, and in the interest of time I want to submit some of them in writing, particularly to Mr. Sasser and Mr. Dunham, on the particular needs we have at DFW Airport. But I would like to direct my questions at this point more to the big picture, and each of you has spoken of the need to look at all of our transportation systems together.

I see in our area a problem that not only, so we perhaps look at all of them together, but we do not even really coordinate some of the same modes very well. And we found ourselves over the last year in some ways arguing with proponents of changes at Love Field, over how those two airports should work together, DFW and Love Field.

Do you think that we are, as a federal government or as a public works and transportation committee, doing a good job in fostering the kind of big picture assessment of our transportation needs that should take place on the local level perhaps?

Are we doing what we should to encourage the regional planning, both in regard to the airports and considering the opportunities for land transportation, that we should do?

I tend to think that we look at aviation here and we look at rail here and we look at highways here without really considering how they work together, and I do not know if some other countries have done a better job of integrating those than we have.

I would ask your general impressions about whether or not you think we do a good job in setting policy that maximizes the benefits from at least all three. And if not, what could we do to perhaps improve that and encourage cooperation between the various transportation modes?

Mr. **Sasser**. I think that is one thing I specifically mentioned. I agree with you. I do not know that we are doing a bad job. Certainly transportation is not languishing in the Dallas/Fort Worth metroplex. But I think we could do a better job, and I think some of the ways are such things as some oversight committees or a better coordinated planning process with all entities involved, meaning all entities such as all cities, but also all entities such as all modes of transportation. I am in total agreement with what you just said.

Mr. **Dunham**. I might add, I guess I would not feel qualified to say how the transportation committee of the House is going to push down your view on how it should be coordinated. I agree with Jack, however, that I think there is room, there is always room for improvement. I think we do a fairly good job here, though. And if you look just at the airport as an example, we will soon be entirely encircled by freeways, two more under construction now, one up the east and one up the west side. I am not sure we will ever have enough, to be quite honest with you, because no matter how many times you open a new one, it seems to be clogged the next year.

We are working with the Highway Department to put access across the airport, to cut down on some of the freeway traffic. We have dedicated rail line. We have reserved space for rail line to come into the airport.

So I think on a local matter, at least as far as it relates around the airport, I think we are doing a fairly good job. I do agree with Jack, though, that I think maybe instead of just the Council of Governments talking about some of this, that there could be a little more action, because I do see—we end up, seem to be competing for the same amount of funds and maybe that is the job that you have to hold down in Washington is to try to decide what is the, as Chairman Anderson mentioned, what is the best benefit for the dollars.

I do not like to go out and compete with sewer districts and housing projects and everything for funds. That is why we are now supporting letting us collect our own money on the airport and we will keep it there.

Mr. **Payne**. I think one of the major problems your committee has faced since 1980, you have been under increasing pressure for the reduction in funds for transportation. These funds have been reduced annually since 1980, and you have now, rather than working together, highways, public transit, and air each competing for these reduced funds. I think you have done a marvelous job in "keeping all the balls in the air," and trying to provide funding for all three of these very important parts of our economy. But I think that, if anything, we need to look at transportation in general and all modes of transportation rather than trying to say, okay, we have the highways here, we have transit here, and we have the air here.

I think if we can get all three of the modes of transportation more integrated with each other, pulling in the same direction, then I think we are better off.

There is certainly no criticism of your committee, because as you certainly well know you have been under increased pressure since 1980 as the funds have been reduced and the budgetary problems that you have faced since that time.

Mr. GEREN. Again, thank you all for your responses. I have several questions I would like to submit in writing that have to do specifically with some of the technology needs at DFW and of the FAA.

Hershel, I would like to ask you just for a moment, for the benefit of the committee, to discuss what you see from the Texas perspective the advantages of the steel wheel high-speed rail as opposed to maglev. I know our committee has spent some time looking at the maglev option. It is certainly a great concern to the Chairman.

As I understand it now, Texas is more likely to end up with a steel wheel rather than the maglev, and believing that it better serves the needs of our region than the maglev would.

Mr. PAYNE. I think, Congressman, the reason that we in the Texas High-Speed Rail Authority at this point are looking at steel wheel as opposed to maglev is that maglev is still experimental. There has never been a proven maglev system in operation. Steel wheel has been in operation for some time. Steel wheel in France right now has broken 300-mile-an-hour barriers. Maglev can do the same, I feel certain, but maglev does not have the track record that steel wheel has.

Steel wheel is, in my opinion, after having ridden the maglev and the steel wheel, it is equal to maglev in comfort. It is equal to maglev in speed. It is much cheaper to construct steel wheel than maglev. Due to the topography of Texas being rather flat, we do not need anything other—we do not have to tunnel, we do not have to up and down the mountains and the hills that some others may have. Therefore, steel wheel is very conducive to the Texas topography.

I guess the main thing is we want something that has a proven track record, that we think is operational now. The French TGV, for example, has been in operation for a number of years without one single accident, without one single problem.

We think maglev is technology of the future, but it is still experimental, and we are looking for something that at this point in time that is proven, and we feel that would well serve us into the year 2020 or 2040.

Mr. GEREN. Thank you very much. I have no further questions at this time.

The CHAIRMAN. That concludes this panel. Thank you very, very much for your presentation.

Our next panel consists of: Mr. Mike Mocek, Chief of Planning Division of the Fort Worth District, U.S. Corps of Engineers; Mr. Jim Oliver, General Manager of the Tarrant County Water Board; and Mr. Arnold Oliver, Engineer-Director of the Texas Department of Highways and Public Transportation.

We might start you just in that order if you would like. Mr. Mocek first, and Mr. Oliver and—oh, Oliver and Oliver, okay. It threw me there for a minute. So I will let you guys make that decision.

[The prepared statement of Mr. Sasser appears on p. 982.]

[The prepared statement of Mr. Dunham appears on p. 954.]

[The prepared statement of Mr. Payne appears on p. 973.]

TESTIMONY OF MICHAEL J. MOCEK, CHIEF, PLANNING DIVISION, U.S. CORPS OF ENGINEERS, FORT WORTH DISTRICT; JAMES M. OLIVER, GENERAL MANAGER, TARRANT COUNTY WATER BOARD; AND ARNOLD W. OLIVER, ENGINEER-DIRECTOR, TEXAS DEPARTMENT OF HIGHWAYS AND PUBLIC TRANSPORTATION

Mr. MOCEK. Mr. Chairman, I am Mike Mocek. I am the one non-Oliver here today.

On behalf of the Fort Worth District of the Corps of Engineers and Colonel William Brown, our District Engineer, I am honored to participate on this panel and provide testimony on our flood protection activities in this region. The Fort Worth District was established 40 years ago in response to the devastating floods of 1949, and since then we have served the flood protection and other water resources needs of two-thirds of the state of Texas.

The Trinity River Basin comprises an important portion of the area that our district serves. With its headwaters to the north and west of the Fort Worth/Dallas metroplex, the Trinity River and its major tributaries flow through both cities and then southeastwardly to meet the Gulf of Mexico just east of Houston.

Since 1950, the Fort Worth District has constructed eight multiple-purpose reservoirs in the Trinity River Basin, and two major floodways, one in Fort Worth and one in Dallas. These Corps of Engineers projects represent a federal flood control investment in the basin of over $124 million, and updated to current price levels that's over $520 million. This sizeable investment has paid for itself many times over. In the April-May 1990 floods alone, our projects prevented an estimated $2 billion in damages in the Trinity River Basin.

Flood protection in this region is not complete, however, and probably never will be. The flood damages we experienced this past April and May in the Trinity River Basin have been preliminarily estimated to exceed $300 million. Just one year ago, our region also suffered millions of dollars in flood damages during the floods that occurred in May and June of 1989.

In response to the heavy economic losses and human suffering experienced in the 1990, 1989, and numerous prior floods, the Fort Worth District is currently involved in three significant efforts that may lead to future expansions of our flood protection system.

The Upper Trinity River Basin Study was authorized by resolution of the Senate Committee on Environment and Public Works on April 22, 1988. We have completed the reconnaissance phase of this study and have negotiated a cost-sharing agreement for the feasibility phase with the North Central Texas Council of Governments acting on behalf of 15 sponsoring entities. And these 15 entities include: nine cities, three counties, Mr. Jim Oliver's organization, the Tarrant County Water Control and Improvement District, the Trinity River Authority, and the Texas Water Development Board.

I would like to emphasize that this is a $7.5 million, five-year, comprehensive cost-shared study effort involving approximately 20 participating organization. Close intergovernmental cooperation is absolutely essential for us to enjoy any degree of success in this study. I believe we have both the interest and the organizational structure to facilitate such cooperation. This cooperation, plus the automated, comprehensive data base we will establish for this study, makes the Upper Trinity an appropriate model, I believe, for addressing a wide array of infrastructure needs in the metroplex and also in other regions of our country.

A second Trinity River Basin study was authorized by the Senate Committee on Environment and Public Works on June 12 of this year, principally to address those areas south of the Fort Worth/Dallas metroplex suffering losses in the floods of 1990. The Trinity River Authority has indicated its interest in sponsoring this study which will be jointly conducted by the Fort Worth and Galveston Districts of the Corps of Engineers. Initiation of the reconnaissance phase of this study is awaiting fiscal year 1991 appropriations.

Our third major flood protection effort in the Trinity River Basin is the Dallas Floodway Extension, a project authorized by the Rivers and Harbors Act of 1965. Had this project been in place in 1989 and in 1990, a great deal of economic loss and suffering would have been prevented in the industrial and lower income residential areas of south Dallas.

This project was under design in 1982, when the local sponsor found itself unable to continue assurances of its support. Consequently, the project has been held in an inactive status until 1989 when the City of Dallas renewed its commitment and asked that we resume our efforts. We will begin a reevaluation of this project in fiscal year 1991, pending the appropriation of funds.

In summary, the remaining flood protection needs of this region are great—as are the environmental needs and concern. Our intent is to address both flood protection and environmental issues with the three major efforts that I have just described, plus numerous small projects that we have under way. We maintain close working relationships with all our project sponsors, with the public, and with other entities of government and find those relationships to be absolutely essential to the successful accomplishment of our responsibilities.

I thank you for the opportunity to address your committee this afternoon and would be happy to respond to any questions you may have at the appropriate time.

The CHAIRMAN. Thank you.

Jim Oliver.

Mr. JIM OLIVER. Thank you, Mr. Chairman.

My name is Jim Oliver, and I am General Manager of Tarrant County Water Control and Improvement District No. One. Our water district was created in 1924, in response to a devastating flood that occurred in 1922 and inundated Fort Worth. Since then, we have expanded our role from flood control to include water supply, and we now supply 30 municipal and industrial customers throughout ten counties in north central Texas. The District owns and operates four major water supply reservoirs as well as operates and maintains the Fort Worth Floodway as a local sponsor with the Corps, and the Fort Worth Floodway is a system of levees and flood control structures along the West and Clear Forks of the Trinity River that encompasses some 26 miles of the river.

For the past two consecutive springs, the District's water supply reservoirs and the Fort Worth Floodway have been hit by flood events brought on by record rainfall for this region. In both 1989 and 1990, average rainfall totals, which are in this area approximately 30 to 32 inches, were reached throughout north Texas by June of those successive years. So in the first six months of each year, we reached our annual totals in both 1989 and 1990.

The District's four reservoirs were all designed as water supply reservoirs. Each reservoir only has a small amount of useful floor storage capacity. We own all the real estate below the reservoir, but we only have a flood control easement above, a small flood control easement above the reservoir operational level, and it is only there for temporary storage. Inasmuch as it is just a flood control easement and the residents or landowners who own the property along the shoreline have been able to and have chosen to construct homes and other improvements in these flood flowage easements.

The development around the reservoirs located northwest of Fort Worth on the West Fork of the Trinity River, around Bridgeport and Eagle Mountain Lakes, experience considerable damage as a result of these recent flood events. Also, flooding occurred along the Fort Worth Floodway as well. Residences located near several sump areas along the floodway were flooded due to high flows in the river which prevented water that collected in the sumps to flow into the river. These sumps were designed for only a 50-year flood event back in the 1960s, late 1950s and early 1960s. Development in these adjacent urban areas has decreased the level of sump protection due to the loss of valley storage. Increased volumes of water now moves more quickly into the sump areas. When the river stage is above water level in the sumps, water cannot flow out of the sumps. Thus, the sumps overflow and flood some of the low lying neighborhoods in those areas.

The area between the terminus of the Fort Worth Floodway and the Dallas Floodway experienced heavy flooding as well. This area has never been channelized or protected. It is some 30 river miles that lie between Fort Worth and Dallas.

The two consecutive years of serious flooding in the Upper Trinity River Basin have accentuated the need for additional flood control planning for the region. As Mike said, the Fort Worth Corps of Engineers has recently completed a reconnaissance study that identified several structural and nonstructural alternatives that would alleviate flooding problems in the Upper Trinity River Basin.

The recommended alternatives, several of which impact our District's existing flood control and water supply structures, will receive further study in a feasibility study to be initiated by the Corps, as Mike said. The study will investigate potential levee improvements along the Fort Worth Floodway as well as evaluate the performance of sump areas and their impact on interior drainage through Fort Worth. Finally, the study will evaluate a potential flood control reservoir on the West Fork of the Trinity River between our two lakes, Lakes Bridgeport and Eagle Mountain Reservoirs near the City of Boyd, which is in Wise County.

If built, the Boyd detention structure will serve to store flood flows on the West Fork of the Trinity River, and right now there are no flood detention facilities on the West Fork of the Trinity River. The structure will have no water supply function. However, there will be a water quality improvement situation because the flood control structure will trap the sediments before they get into Eagle Mount and Lake Worth, which are two of our primary water supply lakes and the City of Fort Worth's water supply lakes. Those sediments would normally travel downstream and contribute to the siltation of these reservoirs. Water supply releases from Lake Bridgeport would be allowed to pass through to Eagle Mountain and down into Lake Worth.

The flood control storage provided by a Boyd detention structure would assist in the storing of flood waters and the timing of flood releases from reservoirs throughout the Upper Trinity Basin as well as help protect the District's Bridgeport and Eagle Mountain Lakes from flooding. Also, the Corps's feasibility study could recommend a structural alternative such as Boyd in lieu of other possible downstream improvements and extensions to the existing floodway. So by trapping some of that water upstream and releasing it in a systematic manner, we could possibly avoid raising the levees through Fort Worth and some other structural alternatives that could be very expensive to do in the urban areas.

The feasibility study, as Mike said, is scheduled to commence in September. Should this study recommend structural alternatives within the operational area of our water district, the Tarrant County Water District will serve as the local sponsor of any problems pursued by the Fort Worth District of the U.S. Army Corps of Engineers.

Thank you, gentlemen, for the opportunity to speak.

The CHAIRMAN. Arnold.

Mr. ARNOLD OLIVER. Thank you, Mr. Chairman, and again, I want to thank the committee for giving us an opportunity to be here. We appreciate your presence and your taking the time to come to Fort Worth, Texas.

The CHAIRMAN. I would especially like to thank you. You know, you are working pretty hard. I am not sure they are aware. You were testifying before us about ten minutes after 9:00 this morning in another part of the state.

Mr. ARNOLD OLIVER. That is correct.

The CHAIRMAN. So I want to say thank you and congratulations. It is even beyond the normal.

Mr. ARNOLD OLIVER. We want you to be sure to get our message. [Laughter.]

We talked about rural needs this morning. We would like to focus a little bit this afternoon, since we are in the middle of this metroplex area, on some of the urban problems. And in the interest of time, I will skip a good deal of my prepared remarks, which you have a copy of.

But I would like to focus your attention on the fact that Texas today has a population of about 16 million people. We expect to reach a population of about 20 million during the next decade. Until 1940, we were predominantly a rural state. That is, about 80 percent of our people lived in rural areas. Today, however, that picture has completely reversed. About 80 percent of all Texans are now urban residents. That means that we are about 5 percent more urbanized than the national average.

Over the last few years, in Texas, we spent a great amount of our resources trying to alleviate the congestion problem in our metropolitan and urban areas. In spite of the great expenditure of those resources, we are just barely keeping pace with the increase in traffic. We are not making that much inroads into congestion problems in our urban areas.

The increasing urbanization of Texas demonstrates what we consider to be the national imperative of Texas highways and why we feel that federal assistance has to continue. That assistance has to reach out beyond today's interstate highways. And in this light, we join with the American Association of State Highway Transportation officials in recommending a restructuring of the federal/state partnership in the current federal aid program.

They recommend a two-part program structure—a categorical or a focused program and a flexible program—for both highways and public transportation. This two-part structure would continue to address the national needs, but it would also allow the states the flexibility to determine and address local needs.

And to give credit where credit is due, I think that the administration's current transportation policy and the proposed legislation being drawn by the Federal Highway Administration addresses a great number of the problems that we face in transportation these days. In my estimation, they have done a good job of focusing on intermodal issues which you have heard a great deal of testimony here today.

Another point we would like to make, and these are embellishments to my written comments, but I hope you will take them under advice, we feel that in the reauthorization of the new transportation bill, it is going to be very important to revise the formulas through which federal funds are distributed to the states. Texas is one of 15 "minimum allocation" states, of which California is also one, Mr. Chairman. That means that we only receive back about 80 to 85 percent of the funds that we contribute to the various trust funds. We feel like in the future it is going to be very critical that we receive a greater funding of this.

It may be interesting to note that the current apportionment formulas for the majority of our highway system in this nation are founded upon factors that were put in place in the first Federal Highway Act in 1916. Those are primarily land area, postal road mileage, and population. We maintain that after all these years that new factors that can respond to changing situations, not only in the individual states but across the country, should be considered.

At the beginning of the system, in 1916, postal road mileage since we had very few paved roads, was a good indicator of the need for the system of the United States. That system is essentially complete at this point. We are not adding a great deal of mileage to the system. We are adding lane mileage but not center line miles. So we feel that that mileage is no longer adequate to represent the system. Same thing for population. The population is only calculated once very 10 years. So you have a shift in demographics or population, you have to wait 10 years to get the benefit from that. We also feel that there are better indicators that formulas could be based on that would be more fair and equitable for the states.

Now, one would be lane miles. This is a direct measure that we know from day to day the accurate figure of lane miles, and this measures the extent of the system, how big it is. We think that vehicle miles traveled, which is a very current indicator of the use of your highways, determines the usage of that system and how fast it is liable to deteriorate. We also feel like the fuel usage should be a factor in computing the formulas for apportionment to the states. This measures, to a certain extent, the usage of the system, but it also will capture, in terms of diesel fuel usage, the usage of trucks on the system.

The third point I would like to focus my remarks on is that, as you have heard here today, we feel like it is absolutely necessary to increase the levels of federal transportation funding. And needless to say, that requires, in our estimation, a spend down of the trust funds that are being held as you so eloquently stated at the beginning of this session today, Mr. Chairman.

That is essentially the focal point of my remarks, and the information I would like to give you. I am free to answer any questions you may have.

The CHAIRMAN. Let me throw this out. If a federal program were established, and I hate to use the term, but let us call it an infrastructure block grant, let us assume some of the money were distributed by a formula that we developed, what would you think of the remainder of the funds going out according to a benefit/cost formula, with the better projects getting preferential treatment? What problems do you see in this approach?

Mr. ARNOLD OLIVER. I will address that from the highway standpoint, Mr. Chairman.

I think it is evident through any procedure that you use that highways are a very cost-effective means of transportation. Now, when you talk about total infrastructure, I think one of the things you have to consider are a number of other factors, including the means of financing that particular portion. Traditionally, highways in this country have always enjoyed the benefit of the dedicated gasoline tax which, as cost-effective as it is, has not been at the level to allow us to address all the needs we have. So highways would stack up very good in that.

However, I think it is becoming more and more evident in this country that we cannot address the transportation needs in this country by adding more lanes. There evidently is a point beyond which we cannot adequately take care of our needs by just building more highways. At that point you have to consider the different methods of financing both public transportation, highways, rail and the others.

So in answer to your question, I think that, in terms of your question about a portion of it being based on cost effectiveness, I believe that cost effectiveness should be the prime consideration, but there are other factors that have to be taken into account.

The CHAIRMAN. Would you like to answer this first question before I go on?

Mr. JIM OLIVER. Not being that involved in federal funding, I would have to agree with Mr. Oliver. If it is a fair cost/benefit ratio, I think that would be a good way to distribute those funds.

Mr. MOCEK. I would just like to add that I would love to see money of the programs of the federal government subjected to the same rigorous benefit/cost analysis process that our Corps of Engineers projects are subject to. I think most folks really—most of the public really do not realize the depth and detail of the economic analysis that we put into our projects before we get to the point of recommending them to the Congress for implementation.

Beyond that, I do see some difficulties in dealing with different sorts of public works concepts under an equitable benefit/cost analysis. In many ways, it is difficult enough to analyze the benefits and costs of different water resources purposes such as flood control and water supply. You put those into other sorts of public works issues that have different social values that are difficult to measure economically, I could see a great deal of difficulty in an equitable benefit/cost analysis for setting priorities.

The CHAIRMAN. Would you like to ask some questions?

Mr. GEREN. Thank you, Mr. Chairman.

I want to thank all three of you for making the time to testify today. Certainly appreciate it. It is helpful to all of us. I would like to start with a question to the Corps and to Mr. J. Oliver regarding the flood control efforts that you do have underway here.

As a result of a long and dedicated work the Corps and the Tarrant County Water Improvement District over the last 40–50 years, our areas was spared much of the devastation that we would have suffered this last spring and the preceding spring. You all have done an admirable job of controlling these unprecedented amounts of water, and you do have studies underway right now that you talked about, to try to prepare us for future improvements.

Are there any other areas that are not being addressed right now? And I know the Corps and the Water Board do work together and do a good job of coordinating what each of you does. Do you feel that the studies that you currently have funds and that are currently underway are going to address the problems that are on the horizon, or do you think there is more that Congress should be doing right now to make sure that we can continue to move forward in our efforts to control the flood waters that you all have to deal with every year, or every so often, anyway?

Mr. MOCEK. Well, I feel, in the Upper Trinity River Basin, in the Fort Worth/Dallas metroplex, the cost-shared Upper Trinity study that we have embarked upon and are getting ready to start the feasibility phase gives us an adequate tool to address the needs of the region, particularly with the level of cooperation that we have gotten with other entities of government.

We have, I think, a wonderful opportunity to address the needs and to come up with viable solutions to many of those needs. That, coupled with the study that I mentioned that was authorized this June by the Senate Public Works and Environment Committee to address the needs of the middle and lower portions of the basin, I think, gives us a good opportunity to find out what really is needed in this area and what is to be done.

In addition to our studies, I would like to mention also that under the umbrella of the Council of Governments the cities and counties have embarked on an effort here in this region to address the increasing runoff that accompanies the development that we have had and that we will continue to have, and that is a very significant issue in flood protection planning; to be able to not only accommodate the sorts of floods that happen today with today's level of development, but what is going to happen in the future when we have even more parking lots and more roof tops and more streets contributing to the runoff, and how should that be addressed, whether it be through some sort of development control mechanisms or through some sort of structural or nonstructural projects once that development does occur.

Mr. GEREN. Thank you.

Jim, would you like to add to that at all?

Mr. JIM OLIVER. Yes. I totally agree with Mike. We started our study some years, a few years back, a reconnaissance study of the Fort Worth Floodway, and at that time we were really advocating a large metropolitan study to look at the whole urban areas, the Dallas/Fort Worth metroplex. And the fact that all of these studies have now gone from little piecemeal studies rolled into one big urban package, I think is really going to be a plus for this area, because what we do up here in Fort Worth impacts Dallas and below, because all that water—the headwaters of Trinity are up in our area, within our District area, and that all flows through Fort Worth and down through Dallas and down to the Gulf.

So to answer your question, the study that we have now I do not see any improvements necessary. I think it is going to address all the issues that we have been concerned about.

Mr. GEREN. Well, that is good to hear. I appreciate that.

Arnold, I would like to ask you a question. We have spent a good part of this year looking at the costs that we foresaw for the challenge of meeting our country's aviation needs, and decided even if Congress and the administration were to be sufficiently wise to release the funds in the trust fund, which we have all been frustrated with, and no closer to resolution now, I am afraid, than we were when all this began, this debate began, that even if those were released that there is still not adequate money in the system to meet the needs of our burgeoning aviation transportation system.

We have seen study after study on the other areas of transportation, highway being one. We had a study done by the American General Contractors that showed that 5 percent of our rural highways are deficient. It went into the bridges. Eleven percent of our urban highways are deficient. Statistics do not look at local roads.

Do you believe that within our current system that we have mechanisms in place that are going to provide adequate funds to meet the needs of our highway transportation system? I know the state is looking at that as well right now. But do you consider the resources available on the federal level—do we have mechanisms in place to meet those needs, or are we going to have to locate additional funding sources or step up the current funding sources if we are going to meet the needs of our highway system?

Mr. **Arnold Oliver**. I think eventually that there will have to be additional resources. Of course, the problem that you point out, in my estimation, only focuses on the fact that we need to spend everything we have got available to us right now, which puts more emphasis on freeing up all the monies that have already been collected to do these highway projects.

Another factor that enters into that will be determined greatly by the form and shape of the new authorization bill. If, as AASHTO and the Federal Highway Administration has proposed, if you go to a system of national significance where you identify a system within the United States, which would comprise somewhere around 140,000 to 146,000 miles, and you determine that this system is what the federal government needs to focus on, and if you spend federal dollars primarily on that system, then you have limited your federal needs to a size that could be handled quite nicely, I think, by the current tax structure, realizing that inflation will eventually eat away whatever you put in place at this particular time.

I think it is important note that nationally only about 30 percent of the highway funds come from the federal government. Most states spend about 70 percent of their own local tax dollars on their own systems. So the majority of funding does not come at this time from the federal government.

I do think that the system will eventually have to be increased to provide the level of service. The Chairman has in both hearings today pointed out the fact that the infrastructure spending in this country has decreased over the years by a consideration amount. So if you go back to a point some time in the past and try to bring the system up in terms of constant dollars to that, you are certainly looking at an increase in the taxable funds.

Now, the other side of that coin is, and this relates to the previous question somewhat that the Chairman asked about cost effectiveness. The people in this country, because of the user fee concept of gasoline taxes, have already been more than willing to tax themselves for highways, because they knew that the money that was being collected would go directly back into the highway system to benefit them. They could see where the money was going.

And for this reason, we feel that if the current deliberations of Congress result in a gasoline tax for merely the purpose of deficit reduction, that that trust with the public will be broken, and that the user fee concept will be not looked upon as highly regarded in this country in the years ahead that it has been in the past. So we definitely discourage that also.

But in terms of the other transportation modes, as I said previously, highways have been very fortunate in that they have had this dedicated revenue. The reason it has been so popular is because people can see where it is going. It is obvious that for rail or for public transportation that the user fee concept will not work, because the cost/benefit ratio is just not there.

So looking at multi-modal type transportation, you have to look very careful at the means of financing each one of those and to be sure that you have trust from the public that each one is receiving its fair share and that funds are not being diverted from one area to another simply to finance a problem that is not cost effective.

Mr. Geren. Thank you. I appreciate your comments and I will tell you, I could not agree with you more about the concept of user fees. It is so difficult to ensure that we make the kind of investments that are necessary in our infrastructure when those dollars are competing with other, oh, I guess, projects that have more sex appeal, for want of a better word. In the long term, there is nothing more important for the health of this country than making those investments, and I would oppose any effort to break that compact we currently have with the public. I guess that battered compact when you consider how we have handled our trust funds recently, but at least we have maintained the appearances of maintaining it, which I hope we can get back to actually using the money as it was intended, and I certainly would oppose any effort to divert user fees away from our transportation system. I hope they are not successful.

Mr. Arnold Oliver. I think in a very real sense of the word by withholding trust fund dollars, we are currently using gasoline tax dollars to offset the federal deficit.

Mr. Geren. No doubt about that, and that is why I referred to it as a battered compact, and that is a change we have got to make and we cannot let ourselves go any further down that road by coming up with some other plan to temporarily divert those fees to some other area of government, because I have a feeling that that temporary diversion would become permanent and our infrastructure would suffer, our productivity would suffer, our jobs would suffer, and it will start a spiral that we cannot afford.

I just want to thank everyone of you for being here. I appreciate your patients. We are running a little late, and appreciate your being here all day long. And, Arnold, thank you for being in Victoria and then being in Fort Worth.

Mr. Arnold Oliver. My pleasure.

Mr. Geren. Jim and Mike, thank you all very much also for being here.

The Chairman. You are not quite through, Arnold. I have got something else.

I want to congratulate the statement, Arnold, that you and Pete just talked about here on this—you just said, where they were talking about using the trust fund monies to pay the deficit. I would hope that you could rally some good, consistent support in Texas for this position you have because every so often we run into just the opposite in other parts of the country. We have had several congressmen produce bills who put in 25-cent a gallon tax to go 100 percent into the trust fund, and there is no relation between the deficit we have and driving an automobile or a truck. I mean, they are not the ones that caused the deficit.

I remember I had one of the guys, who I liked very much, in California about a month ago put in a 25-cent tax, and he was thinking of actually going higher, but he wants to get rid of the deficit, and I do, too. I do not want to do it by way of taxing the people who drive their cars and particularly, I feel so many people who drive their cars are people going to and from work, and they are really not the ones who caused this deficit. So I just want to get that message out.

I have one last thing I wanted to say and you almost touched on it a moment ago there. In calculating what Texas receives under the 80 percent minimum allocation program, we factor in the discretionary and the demonstration funds into that.

Do you think we would be better off excluding those funds from the calculation so that should Texas merit getting any demonstration and discretionary funds it would be over and above your 80 percent funds?

Now, other than the status quo, which reduces your 80 percent apportionment by the amount of discretionary highway monies that you may bet. I mean, there is a little confusion there in my mind and I just wanted, from an expert point of view, you could maybe tell us a little more about that.

Mr. **Arnold Oliver**. Mr. Chairman, in my view, the answer to that question is no.

The **Chairman**. No.

Mr. **Arnold Oliver**. Number one, we would like to see the end to all demonstration projects, period. The discretionary funds have resulted in skewing of the allocations to various states, depending upon certain situations that existed at the time. We think that the move should be toward a formula system, as I stated before, that looks at each state in terms of the vehicle miles traveled, the lane miles in the system and possibly fuel usage, and simplify those formulas, give us back the money on those apportionments that we send up there, forget about demonstration projects. We will take our money and decide what we would like to spend our tax dollars on within our own area and jurisdiction.

The **Chairman**. Thank you very much.

Mr. **Geren**. Can I make one other comment?

The **Chairman**. Go ahead.

Mr. **Geren**. I just want to point out the leadership the Chairman is offering on this subject of using our user fees for something other than transportation. You notice he referred to the congressman from California that proposed taking 25 percent and using it for other than highways. He said, I used to like him very much. [Laughter.]

That is leadership, Mr. Chairman.

Chairman. A little bias there to expose.

Well, thank you very much.

I think we are ready for our final panel, if they are here. This panel consists of: The Honorable Bill Flippo, Mayor, City of Saginaw; Honorable James Herring, Mayor, city of White Settlement; Mr. Greg Dickens, Director of Public Works, City of North Richland Hills; and Mr. Ron Haynes, Director of Public Works, City of Hurst.

Mayor Flippo, please begin.

[The prepared statement of Mr. Arnold Oliver appears on p. 964.]

[The prepared statement of Mr. James Oliver appears on p. 969.]

STATEMENT OF BILL FLIPPO, MAYOR, CITY OF SAGINAW; JAMES HERRING, MAYOR, CITY OF WHITE SETTLEMENT; GREG DICKENS, DIRECTOR OF PUBLIC WORKS, CITY OF NORTH RICHLAND HILLS; AND RON HAYNES, DIRECTOR OF PUBLIC WORKS, CITY OF HURST

Mr. FLIPPO. Thank you, Mr. Chairman. Good afternoon to you and members of the committee and our Congressman, Pete Geren. Thank you very much for being here with us today, and I will try to be brief because of the lateness of the day.

I represent the folks that are the nuts and bolts of what we talked about today. We talked about the big picture, and my folks make up that big picture, and I would like to comment upon how the infrastructure needs affect my people and what our needs are. And, of course, all of these are a part of the big picture.

I think we are a typical small town, and I think there are folks like us all over the USA, and you have probably heard our story and you will hear it again, again and again.

We just recently completed a capital improvement study and our needs and all, I will prioritize those as we prioritized those, and our biggest need is drainage, and that was especially pointed up in the flooding that we had this spring and last spring, and that is because of age of our infrastructure for drainage, and also because of undersizing. Back in time it probably wasn't prepared for the development that we have had and that we are having and it is affecting the development that we are trying to have and trying to get. So that is our biggest problem, and it is probably three times in magnitude our second priority, which is our street systems.

Their problem is because of age and also carrying capacity, and we do everything we can to extend the life of those streets, because when I ask my folks for a dollar, they expect to get a dollar's worth out of what we do. So we certainly try to do that.

The third priority, as has been talked earlier, are our sewers, and to us these are a time bomb, and I think they really are over the entire nation. Most of the materials that we have in the ground, as we have problems and dig those up, we find that the sewer gas is eating the top out of those and they eventually crumble, so we do not know where the next time bomb will hit or the magnitude of it. I really think that is representative of probably the entire nation.

And then, of course, our water infrastructure, because of the age, the problems that we have there. We average—we are just a small town, as I mentioned. We average a water main blowout a week probably because of age and size and capacity that we are trying to serve now.

Also, our public building infrastructure, because of growth, probably none of our buildings are adequate and probably our hottest issue in that area right now, because of quality of life, is libraries. I have caught more heat over our library system than I think anything else this year.

Now, we personally are trying to attack these as we can with bond issues and, of course, operating funds, and we try to do that as we think our people can absorb the cost.

We are also tangling with another issue. It is a good issue for us, and it may be repeated and maybe it is being repeated now across the nation because of perestroika and maybe because of peace dividend, we are looking at probably some federal property becoming surplus because of a lack of need that we are glad to put back into private sector. But with that we have the problem of the infrastructure. We do not have any control over federal structures, and so the infrastructure there either does not exist or it is probably not to our standards, so we have some problems there. But we think it is a good problem, because we are putting it back into the private sector and we are working with the Corps of Engineers for that.

I would like to issue some accolades to usually a much maligned organization. The Corps of Engineers have been a pleasant surprise to work with. We have worked with competent, good, caring people, and I certainly want to bring that to your attention that we have nothing but good to say about the Corps of Engineers. I certainly want to thank them.

That is just a brief, little synopsis of how my folks see infrastructure. We are in a part of Tarrant County that is probably as fast-growing as any part. We are probably 10 miles south of Alliance Airport. We are two miles south of the new Federal Mint. And if Masushita ever makes up their mind and settles in Tarrant County, I believe within a mile of our town.

And so we are growing and developing, and it is placing great demands on our infrastructure. We are trying to keep pace, and I certainly would not attempt to try to tell you anything to do for us or any other small cities other than remember that we are probably all about the same and have the same needs, and anything you can do on a national policy-wise would help us and help development and help our quality of life.

Thank you so much.

The CHAIRMAN. Mayor Herring.

Mr. HERRING. Thank you, Mr. Chairman. I appreciate the opportunity of being here today and thank you very much and your committee for coming down here and allowing us the time to speak with you.

I will pretty well echo the same things that Bill said. My main emphasis that I would like to get across to you today is concerning flood control. And as you heard from the last panel, we have a considerable problem within this north Texas region on flood control. I think primarily because years before we began good planning processes we had new people that came in to settle in our communities did not perceive that growth would eventually happen in this area, and adequate facilities were not made available at that time or simply monies were not available to get them to the capacity that they need to be today.

This past year and the year before in my city of White Settlement we experienced extensive flood problems. We are working with the Corps of Engineers. They have done a study, a reconnaissance study already and are in the process of a feasibility study.

We feel that our need is faster and greater than the Corps of Engineers can move, even though the plans that they have come up with are good plans and adequate plans. We are looking for additional funds to help us control the flood situation. Ours does not appear to be a situation we can control with structural installations. It is more of a buyout situation, and we are committed on our own to go ahead and doing some buyout to eliminate immediate flood problems on those structures that get hit every time that we get a large rain.

I would like to address just a little bit the questions coming up about some of the feasibility studies that—the cost/benefit studies that are made. We have faced a problem with this in some of the preliminary discussions we have had thus far that it seems to us to be that those areas of low income people are—I will say lower-middle income people—cannot benefit from the formula that is used in this cost/benefit study.

If our homes that are in question were more valuable homes, there seems to be no question as to the fact that they could be simply bought out, people relocated and no problems. However, the situation in our area is that we have got either low income or lower income structures, say $40,000 to $50,000 value range, and it seems that the farmer works against those time periods that these type structures just need to be picked up and moved, and we are talking about structures that are quite hold. Some of them 40 years old or maybe 50 years old that we do not feel like lend themselves to being moved. And in the process of doing a moving like this, we run into zoning ordinances that are in effect throughout the city that pretty well jeopardize the integrity of some of our zoning laws.

We would like to encourage your committee to look into problems like that. Congressmen Geren is aware of some of the problems we have faced here. And it may be that we come up with a reasonable solution after some of the feasibility studies are done, but at the present time it looks like we are kind of up against a little bit of a rock wall here.

I would like to encourage the committee's involvement also, as was mentioned earlier by Mayor Bob Bolen and some others, that in the process of bringing monies back to the cities, the revenue sharing seemed to be one of the most economical ways of getting that money back to the local entities.

Particularly in the case of White Settlement, we were able to use always that money from its inception to the very end of it only for those special projects that we could not find monies otherwise for. None of this went into the operating budgets of the city. It was simply to do projects for the betterment of life or for pollution control or infrastructure buildup, both flood control, roads, public buildings, things of this nature. And we feel that is a very effective way of getting that money back. And with the guidelines that were set on it before, it pretty well restricts the community from being able to just squander that money on things that really tax monies ought to be taking care of. We would encourage you to push for that effort.

As Mayor Bob Bolen said, we may not see that in our lifetime. I would like to see it in our lifetime. I am not quite as old as Bob was, so in my lifetime I really would like to see it back again, and the sooner the better. I think we all make good use of that.

I will conclude with that as far as my comments. Again, I thank you very much for allowing us to be heard.

The CHAIRMAN. Mr. Dickens.

Mr. DICKENS. Chairman Anderson, Congressman Pete Geren and other committee Members, thank you for allowing North Richland Hills for testifying before you this evening concerning what these Tarrant County infrastructure needs, and I will speak mainly to transportation since that seems to be one of the main issues out in northeast Tarrant County in North Richland Hills.

We are the third largest city in Tarrant County and have several critical needs. Our number one need is the Interstate Highway Loop 820—State Highway 21, State Highway 26 interchange—which has initially been funded in right-of-way acquisitions ongoing by the Highway Department. We would stress that continual funding of this project until its completion is vitally important to mobility in our city and the northeast Tarrant County area.

Our number two need is the widening of Interstate Highway Loop 820 through the northeast Tarrant County area. This would need to be completed at the same time the Interchange is completed to enhance the interchange operation and relieve current everyday traffic congestion that we experience at this particular interchange.

We also have a great need now and in the future for a major thoroughfare, major north/south thoroughfare, which is Precinct Line Road which would go from State Highway 26 north to Farm to Market Road 1938. It is to be improved to a minimum, or we would like to see it improved to a minimum of five lane thoroughfare width. This would provide a critical north/south lane to relieve congestion which currently in on Farm to Market 1938 and State Highway 26. It will help mobility north and south through North Richland Hills from Loop 820 to Keller and the areas north of North Richland Hills up near, I think, 114.

Additionally, we are in great need of completing the last crosstown lane to Watauga Road from Farm to Market 1938 to Precinct Line Road under the partially federal-funded PASS program. Currently, that is being administered by the state, and we are working with the Highway Department on that. Watauga Road will interconnect with existing major thoroughfares in our adjacent cities on both the west and east side of North Richland Hills. This will help provide a major thoroughfare across northeast Tarrant County, north of Loop 820 and the Airport Freeway, which is State Highway 183.

I would also add that it is important to us to have Farm to Market Road 1938 improvements completed north and south through our city as soon as possible. This is ongoing with the state at this time.

Of course, completion of all of these transporation projects will be vital to the economic development of North Richland Hills and the northeast Tarrant County area and all the surrounding cities.

As Mayor Flippo spoke, we do have other infrastructure needs. Drainage is one of those concerns that we do have. We got hit hard the last couple of years as well from the heavy, intense rainfall. Anything that the federal government can do to assist the cities with their drainage needs here in Tarrant County and the surrounding area would be greatly appreciated.

I think the main thrust of my presentation today would be transportation, because of our location and the fact that the transportation needs are so costly for the size that need to be improved to.

We would also like to say we are very pleased with the cooperation with the State Highway Department and the federal government in everything that has gone forward to date. And I think that is about all I have to say.

Thank you. Appreciate you letting me appear today.

The CHAIRMAN. Mr. Haynes.

Mr. HAYNES. Thank you. Chairman Anderson, Congressman Geren, other members of the committee, thank you for this opportunity to speak to you today.

I am with the City of Hurst, and I find that our needs are not unique after hearing the others speak. I will try to speak of Hurst and about northeast Tarrant County in general.

As you know, northeast Tarrant County continues to experience rapid growth and thus, it requires more and more attention to improve transportation and drainage and other infrastructure facilities. In recent years, the Highway Department and the federal government has seen the needs for our growing area and they have responded admirably with funding for intersection improvements, widening of key roadways and some signal coordination work.

Also, at this time the Highway Department is preparing plans to prepare the interchange at 820, 121 and Highway 26, the widening of the Airport Freeway and the principal arterial street system or the PASS program. I would like to address a few of these projects.

The interchange program is of primary importance. We experience some very congestion there during peak traffic hours and, in fact, the highest traffic volumes in Tarrant County are experienced through that interchange. A very important program for Hurst, North Richland Hills and the northeast Tarrant County area. We continue to experience traffic congestion there. This project was proposed for advertisement in May of 1993, and it is sorely needed.

Precinct Line Road is another project. It is currently a two-lane, unimproved roadway north of Grapevine Highway. It's in Hurst, North Richland Hills and Colleyville is the portion that needs to be improved. The Highway Department is proposing to widen that roadway. And although traffic volumes are relatively low at this time, they are around in the 9,000 vehicle per day range, it is predicted by the year 2000 they will more than triple to 30,000 vehicles per day. And I understand that the Highway Department is proceeding with this project for January of 1992.

Another area of concern is Highway 10, the Cities of Hurst, Euless and Bedford have a strategic development plan for Highway 10, to redevelop that area. We see this as a vital area for redevelopment. It has long suffered from neglect. The improvement of Highway 10, we feel like, will do much to enhance the development along that roadway and also improve the safety. The section in Euless is underway at this time and the section in Hurst between 820 and Bell Spur is supposed to be under construction in late 1992. Most of the right of way for this improvement is available and we urge the acceleration of this project as much as possible.

A coordinated signal system administered through the Highway Department of fuel overcharge monies is also being implemented at this time along Highway 10. We applaud the efforts of the Highway Department for that program. We feel like it is a very good one. It is also hoped and expected that motorists traveling along DFW Airport will be able to use Highway 10 during the interchange program and also the widening of the Airport Freeway, which I would like to address now.

The Airport Freeway or it is known as State Highway 183, traffic on that freeway has increased from 60,000 vehicles per day in 1975, it is expected to be well over—well, it is over 150,000 today. By the year 2010, it expects to exceed 200,000 vehicles per day.

The Highway Department proposes to widen the freeway between Interstate 820, the interchange that we have talked about, from six lanes to 10 lanes beginning in late 1993. Again, this freeway experiences one of the highest traffic volumes in Tarrant County now, and we feel like it will also in the future.

The last transportation project I would like to discuss is the PASS program. Although Hurst did not receive any funding for the initial phase of this program, we feel like our region stands to gain a lot of economic benefits from the extension of these arterial roadways throughout the region and Tarrant County. We appreciate the support the federal government is giving us with that program.

Hurst is confident that the extension and widening of these roadways, the arterials, will enhance development and improve the roadway safety, and we feel like it will diminish, as the Highway Department does, the increasing traffic volumes on particularly the Airport Freeway and other freeways that they parallel.

I encourage the continued use of the state and federal funds for the PASS program. In addition, we encourage your committee to take the necessary initiatives to help accelerate the projects that I have just mentioned and to continue the federal funding support.

I would also like to mention and commend the efforts of the U.S. Army Corps of Engineers. I think Mayor Herring put it very well. Their staff is top notch in the Fort Worth area. We have worked well with them and the City of Hurst has participated in two drainage channel projects in the recent past. Those being Calloway Branch and Loreen Branch. Both projects drastically reduced flooding along these drainage ways. The program I am speaking of is the Section 205 program, and I feel like it needs to continue and all federal efforts made to finance this beneficial program.

In fact, the homes along these sections of Calloway Branch and Loreen Branch were not even flooded during our past May and last May's flooding. If they did not then, we feel very confident they will not.

We greatly appreciate the financial support of the federal government. Without their help, we would not have been able to fund these projects or we would have had to severely reduce the scope of the project.

I would also like to mention the Community Development Block Grant programs for water, sewage, street improvements. I encourage the continuation and full funding of those programs. They have been very beneficial in areas of not only Hurst, but other cities as you have heard. We have primarily used them for water and sewer improvements in low income areas.

In closing, I would like to commend Chairman Anderson, Congressman Geren, Congressman Hayes and the rest of the committee for initiating this forum today. As a representative of the city of Hurst, I appreciate the opportunity to express my concerns.

The CHAIRMAN. Thank you very much, and I will start off with a question.

If we create a new federal infrastructure block grant program, do you see any problems in allocating part of the funds to, in effect, the highest bidder where some of the federal funds go to those willing to put up the highest local match?

Do you have any thoughts on that, because there has been this in the past and there has been some suggestion again that if we get people to put a higher bid up, let us give it to them because that would be less than we have to put up, or more that they will be putting in?

Mr. HERRING. I would have a little bit of a problem with that in respect to some very small communities. I know in our current Community Development Block Grant program, and let me preface this by saying that White Settlement has always come out well in the CDBG program, but there are some small communities that do not yet have the resources to be able to put up a large matching grant, and they are very much in need of these funds to be able to just get them moving.

And I would speak especially of the city of Haslett that is next to Alliance Airport. Here is a small community of I am going to say around 500 people that all of a sudden now has a large airport beside them, and the tax values of the property out there have just run rampant. The citizens are paying far more than they ever, even imagined they would be paying that amount of taxes. They simply do not have the resources to come in and put up a matching grant.

So if a formula were developed like that, I think some consideration would have to be given to allow them still to be competitive, because otherwise they would just totally lose out.

The CHAIRMAN. Pete.

Mr. GEREN. I do not really have any questions. I appreciate each of you participating today and I want to echo the compliments that you have given the Corps. I know all of your cities and our office have worked diligently together with the Corps, and they have been nothing but cooperative, and we appreciate it very much.

I also appreciate the perspective that you bring to this proceeding and that is as leaders and city managers of the smaller towns that have unique problems, that perhaps are not always well represented when only the representatives of the very large urban areas do present their needs. Thank you so much for taking the time to share your thoughts with us and being here today.

I appreciate your patience as well. I know you waited a long time to make this presentation. It will be very helpful to us and as we develop this infrastructure policy, it is just critically important that the small towns do get represented. Too often the small towns share much of the cost of urban growth and urban sprawl, but are not considered as they should as we develop the policies to respond to the demands or the challenge of the growth of urban areas. And as we develop this infrastructure policy for the coming decade and for the coming century, I will look forward to having your continuing input so that we make sure that communities, your communities specifically, but communities such as yours, in general, are well represented.

Mr. Chairman, I would also like to recognize the mayors of the Mr. Dickens's and Mr. Haynes's cities, who are sitting back there on the back row, Mayor Brown and Mayor Sowder. Appreciate their being here today and lending their support and input as we consider many of these important issues.

I do not really have any questions at this time, Mr. Chairman.

The CHAIRMAN. Well, I, too, want to thank this particular panel, because they did wait pretty long. It has been kind of a long day, and we are not even through yet. We are due yet tonight in Georgia somewhere.

Anyway, I want to thank all the witnesses who appeared before us today for their excellent statements. This was a good, productive hearing. The testimony we received will be helpful to us as we work together to form a national infrastructure program.

And, Pete, I want to compliment you for putting together this hearing and your staff for their efforts in helping things to run smoothly. I think with that I will say that the meeting stands adjourned.

Mr. GEREN. Let me make one brief statement.

The CHAIRMAN. Okay.

Mr. GEREN. I would like to extend some thank yous as well. I would be remiss if I did not.

I want to thank you, Mr. Chairman, for being here and giving our community and the leaders of our community a chance for you to hear from them directly about the important needs that we have here. It is a great demonstration of your commitment as a public servant to this country that you have made the time to come to Fort Worth, Texas, and listen to all of these concerns and spend your day with us. We thank you, and I want to speak on behalf of all the panelists in telling you how much we appreciate it.

I do want to thank the staff that has worked so hard to put this together, and my staff as well. This is the result of many, many hours of work, and I hope that everybody feels that it has been productive. I know that I have learned a great deal today, and we will be carrying the ideas expressed today, both in written and oral testimony, back to Washington and I am hopeful, as we develop what is going to be a comprehensive approach to the infrastructure needs for this country, that we will continue to have dialogue with each and every one of you so that what we do makes sense. Sometimes Washington thinks we know more than you know, and that is just flat wrong. So I look forward to continuing to work with you.

I want to thank the City of Fort Worth for offering us these quarters today, and they were just so accommodating.

The CHAIRMAN. They are great.

Mr. GEREN. They worked with us in every way to set this up, and I express particular appreciation to David Ivory, the city manager, and Mayor Bolen, the mayor of Fort Worth, for their help with that.

Again, thank all of you for being here. Thank you for your patience, and thank you for your input, and I look forward to continuing to work with you over the coming months and perhaps over the coming years. Thank you very much for being here.

The CHAIRMAN. Thank you, Pete, and thank you, everyone.

The committee stands adjourned.

[Whereupon, at 5:30 p.m., the committee was adjourned.]

TARRANT COUNTY
100 East Weatherford
Fort Worth, Texas 76196

DIONNE BAGSBY
COUNTY COMMISSIONER
PRECINCT NO. 1

FUTURE INFRASTRUCTURE NEEDS OF TARRANT COUNTY

PUBLIC TRANSPORTATION

URBAN DEVELOPMENT & TRANSPORTATION

Urban transportation will be a major issue for all levels of government during the upcoming decades. Urban development influences and, in turn, is influenced by the transportation system. The Dallas/Ft. Worth metropolitan area is served by an excellent freeway system provided by the State Department of Highways and Public Transportation during the past two decades. The system has encouraged the development of predominantly single family residential land use throughout the county and has allowed the dispersion of major job centers throughout the region.

Tarrant County is unique in that it has different densities of urban development which it must contend with on a governmental level concerning public transportation.

PRESENT PUBLIC TRANSPORTATION IN TARRANT COUNTY

There are cities throughout our county that are far removed from the boundaries of Ft. Worth; i.e. Saginaw, Crowley, Hurst, Euless, Bedford, Benbrook Haslet, Arlington. Ft. Worth singled out since it is the only city in Tarrant County with a public transportation system. The city is served by the Ft. Worth Transportation Authority which is supported by a 1/2 cent sales tax. This is unlike DART in Dallas County which serves multi-jurisdictions. Arlington is served by DART in it's Handitran program of public transportation for the elderly & handicapped.

PUBLIC TRANSPORTATION & ECONOMIC DEVELOPMENT

The lack of county wide public transportation adversely affects economic development in the outlying areas of Tarrant County since employers will tend to choose a location accessible to a large number of the working populace. Economic development which is taking place in the Mid-Cities area and in Arlington is not accessible to many residents of the Western part of the county.

Experience tells us the Federal government will not help fund public transportation in areas without at least a one percent sales tax base dedicated to public transportation. Recent reports of North Central Texas Council on Governments show that FWTA has not applied for federal money knowing they will be passed over for assistance due to their base of 1/2 cent. They know they cannot compete for federal monies with Houston, Dallas and Los Angeles. So that future expansion of this transit authority is not even in the planning stages.

It is time funds are dedicated to public transportation projects which address existing needs of suburban populace regardless of the tax base of the transit authority. The sales tax is regressive. This type tax is a burden on those who can least afford it. The lower the income level the more a family will spend on taxable goods. But these families are the ones who need a public transportation system the most.

PUBLIC HOUSING & PUBLIC TRANSPORTATION

Tarrant County has public housing in many of it's suburban cities. These cities do not have public transportation of any kind. If those that occupy this type of housing are not fortunate residents of Arlington or the Mid-Cities area where most of the jobs are these days they most likely are not able to find work close to home. Their employment needs are not being met due to a lack of transportation. The cost of personal travel has increased not only from the price of oil and automobiles but from the increased distance traveled to the work place. In Tarrant County the average trip length to the work place has increased from 8.92 miles in 1980 to 9.21 in 1990 and is estimated to increase to 9.64 miles in the year 2000.

Additionally, the United Way studies show that the number one problem of lower income families in Tarrant County is transportation. Respectively, the Texas Department of Human Services (TDHS) studies show that the number one barrier to the services they provide is transportation. In Tarrant County TDHS serves 20,368 households per month for food stamps, 7,876 households per month for AFDC, and for SSI, it serves 9,252 households per month.

These studies reiterate the need for federal assistance in public transportation.

TESTIMONY BEFORE THE
HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE
ON NATIONAL INFRASTRUCTURE

ORIS W. DUNHAM, JR.

(Note: Remarks must be limited to 5 minutes, with 45 minutes available to address questions from the Committee)

- I am here today to discuss the importance of national infrastructure. As the Executive Director of Dallas-Fort Worth International Airport, I truly recognize that airports are not the only mode of transportation that must be supported through expansion of our nation's infrastructure.

- As all of you are aware, capacity of our nation's airport's is of vital concern. Many of the larger airports are experiencing delays that are unacceptable, and will only become worse in the future.

- As the second busiest airport in the world, DFW is fortunate to have one of the lowest delay figures for a large hub airport in the country.

- However, our projections indicate that activity will double at DFW over the next twenty years. In order to accommodate our increase in activity and keep delays and costs to an acceptable level, we have a $3.5 billion expansion plan that includes:
    - Two new air carrier runways that will allow DFW Airport to accommodate triple and quadruple approaches under Instrument weather (IFR) conditions.
    - American Airlines $1.2 billion terminal complex with 66 gates

- The infrastructure to support the expansion is not just these runways and terminals; it is other infrastructure such as:
    - New control towers, navaids, and airspace procedures to support the runways and the triple and quad approaches
    - Highways and light rail to provide access to the airport
    - Roadways and additional parking on the airport
    - These improvements are necessary to maintain a high level of service for the traveling public

- We need a balanced approach to infrastructure improvements:
    - Airspace improvements are needed to support the airfield (runway) improvements.
    - Mass transit and highways are needed to support the terminal development.

- Without a balanced approach and concurrent development, the ability to handle the increased traffic and the travelling public will be reduced.

- In order to fund these improvements, I strongly support the implementation of the Passenger Facilitation Charge (PFC); it is a vital and reasonable way to finance projects and is a way for users to participate in the expansion of airports. I believe PFC is critical for airport expansion and is way to fully use the aviation trust fund.

- But it is not just airport expansion this nation needs; a total transportation network of infrastructure is necessary to solve the nation's capacity problems; we cannot solve the problems with one component because they all interact.

- We could build all the improvements necessary at DFW Airport in order to meet our expected demand and have the greatest airport in the world; however DFW could not function if there are not improvements at other airports. And I mean infrastructure improvements at the other airports; the runways, the highways, the rail access.

- So although I am the Executive Director for DFW Airport and support the necessary growth and expansion at airports throughout the nation, I recognize and strongly support the much needed improvements to all areas of transportation industry.

- Thank you for your attention and I am available to address and answer any questions you may have.

KGK:0415

FUTURE INFRASTRUCTURE NEEDS OF TARRANT COUNTY

HIGHWAYS, ROADS & BRIDGES

Commissioner J.D. Johnson
Tarrant County Precinct 4

COUNTY AREAS OF RESPONSIBILITY : PRESENT & FUTURE NEEDS

The state constitution and statutes empower the county commissioners court to provide for the construction and maintenance of all roads and bridges which are not part of the state highway system or within the limits of incorporated municipalities. The county budget provides for this through the individual precincts in the Road & Bridge Fund and county wide in the Lateral Road Fund **(Total FY1990 18.2 million)**. Transportation in Tarrant County is therefore based more on the dollars available in this Fund than on total needs and strategic priority.

Tarrant County has 465 miles of roadway which it must maintain. To bring these roads up to standards set by the American Public Works-Association would cost the county approximately $4 million. This figure is just maintenance it does not include construction of new roads or any type of bridge work.

An example of the county not being able to meet strategic needs is the existence of 4 bridges which need major repair or reconstruction. One such bridge at Indian Creek needs to be replaced and /or raised which will entail road reconstruction as well. The work on this bridge does not qualify for monies under the Federal Bridge Program. This infrastructure type of improvement will cost the county over $300,000. Since this project does not qualify for federal money the county cannot make the needed improvement until money is available or until their is some type of catastrophe. The three other bridges , Village Creek which needs to be replaced will also cost the county $300,000; with the widening and repair of the other 2 bridges bringing the total cost up to as high as $1.5 million.

Drainage is another major infrastructure component which is of major importance to Tarrant County. As you may know the Trinity River is the responsibility of the Trinity River Authority and the Water District. But Tarrant County has several large lakes with major creek tributaries which can cause many problems. I can attest to this since two of these lakes, Lake Worth and Eagle Mountain are in my commissioners precinct.

As these areas surrounding the lakes are developed both by private businesses and single family residences there is increasing cost to the county in the upkeep of roads due to increased travel as well as having to upgrade road standards involving drainage. The residential areas are not inclined to roads with three foot "bar ditches" on either side. The county now must construct roads with underground drainage facilities which increases costs three fold.

Another drainage problem which occurs with increased urbanization of the incorporated areas of the county is the increased instance of the dumping of garbage and brush in creek beds and drainage ditches. These creeks have to continually be cleaned and often widened to alleviate the possibility of flooding during times of heavy rainfall. Many of these creeks also need levees built.

There is no federal funding for such drainage projects even though they are mainly a necessity of flood prevention. A program for Drainage Control and Flood Prevention would be very helpful even if it just provided matching funds--to my knowledge there is no such program.

These roadways in the unincorporated areas of Tarrant County are very important to the overall road network within the county. They provide the skeletal system for the urban network when development occurs. It is a necessity to keep them maintained and improved for higher traffic volumes and speeds to provide a smoother transition from rural to urban facilities. In order to do this the county needs increased funding on the state as well as the federal level. The county is not able to meet present needs let alone set goals for the future development of a county arterial network.

The federal government should provide the funds necessary to improve local drainage systems especially in flood prone areas thus offsetting the high cost of national flood insurance.

Likewise, federal funds should be provided to improve local arterial and feeder thoroughfares thus taking pressure off the federal and state highway systems. Expansion of these systems is always costly due to high "right-of-way" costs and traffic flow disruption due to construction.

TESTIMONY TO

THE COMMITTEE
ON PUBLIC WORKS AND TRANSPORTATION
U. S. HOUSE OF REPRESENTATIVES
AUGUST [illegible], 1990

I am Ralph W. Mason, Jr., President of the Fort worth Metropolitan Black Chamber of Commerce. My comments today will reflect my concern for the proper relationship between infrastructure development and human capital development.

As an analogy I consider infrastructure development and human capital development working in much the same way that the muscle and the skeletal systems of the body work. Muscles get their strength and flexibility from the skeletal system. Without bones muscles simply would not work.

Well likewise in America if the infrastructure of Cities is not taken care of the muscle of the society (the workers) does not function.

While we often focus on building and street decay, the truth is that the human capital of the city decays before the street does.

In the past when the muscle of our society the work force became weak we had ways to exercise it. Our industrial expansion and wars helped stretch and pull the work force.

Anyone who had studied the work projects of the 30's that build our highways, libraries and bridges knows that they were designed to put people to work, as much as they were to build and infrastructure.

My point is that infrastructure development must keep the people in mind.

From the Black Chamber's perspective Public Works projects should stimulate the development of Enterprise zones in impoverished areas.

Our central cities represent a sink hole, not only in terms of streets and bridges, but also in terms of human lives. The paradox of the central city is that it decays while their is seemingly great economic development occurring.

The North Texas Commission (NTC) reported 448,000 jobs were lost in the metroplex by companies employee 100 or more. The good news was that 542,000 new jobs were created by businesses employees less than 100. They concluded that the overall dominant source of new employment for the overall metroplex was the formation of new businesses.

The problem is that a vast majority of the business starts under 100 employees were not in the central city. This means employment opportunities in the central city were actually decreasing as jobs move away.

The statistic that scares me is that during the years of the depression unemployment ran at approximately 17%. Today in our central city areas unemployment for the last 5 years has been at 20%. and for particular segments of our society such as black males between 18 and 25 can be as high as 25%.

Leading economists, such as William Wilson have concluded that the struggle for economic development will be the leading fight for minorities for the 1990's. The growth of manufacturing, retail and wholesale trade in the suburban areas, the flight of affluent families to the suburbs and the decline of the central tax base have made it increasingly more difficult to stimulate growth .

My point is what good is it to have well constructed roads if people cannot ride them to work. What good is it to build bridges between the central cities and the suburbs if there is no mass transit to move people to jobs.

The Kerner Commission report following the riots in 1960 pinpointed that the primary cause to the decay of the inner cities was that the people living there could not pay for decent housing. The landlords therefore could not maintain their buildings or build new ones. The cities could not maintain the areas due to lack of resources.

There is a need in central cities to stabilize housing. HUD reports over 6,000 homes are abandoned in the Fort Worth area. Home ownership brings a stabilizing force to the community. People who own homes take an interest in the community. They commit themselves because they have a stake in the community.

What is it then that I want to see from any attempt to rebuild our communities.

1. Rebuilding efforts should focus on projects in economically deprived areas such as enterprise zones where historically unemployed and underemployed people can gain new skills.
2. Contractors working on projects should have goals and/or incentives for hiring and training the underemployed and unemployed.
3. Contractors working on projects should have goals and/or incentives for utilizing minority and women owned supplies and professional services.

4. Rebuilding efforts should focus on private home development to help stabilize neighborhood.

5. Rebuilding efforts should include incentives for attracting businesses to economically deprived areas in order that once the building is completed there will be jobs for those that live in the area.

6. Rebuilding efforts should include incentives to local governments for mass transit plans that are designed to moved workers to areas that offer opportunities for jobs.

The six points that I have outlined constitute the concept of not just building a skeleton, but making sure that the muscles of our society the people can exercise its self back to good health.

I heard mentioned the question of who should pay for it. I support Major Bolen's position that property taxes in the city have gone up, also general sales tax increases have hurt low-income citizen. I propose an increased taxation on high-income individuals. The current in income tax system is not progress at the higher income levels. That should be corrected.

Fort Worth
Hispanic H Chamber of Commerce

August 7, 1990

Report to Congressional Hearing concerning Tarrant County, Texas, Infrastructure

From: Mr. Frank Gomez, Chairman of the Fort Worth Hispanic Chamber of Commerce
Mr. Jerome H. Mosman, Executive Director, Fort Worth Hispanic Chamber

The Fort Worth Hispanic Chamber was founded in 1973 and presently has a membership of 300 small businesses and 17 corporate sponsors. We thank you for the invitation to share this information.

Concerning the extension of Highway 360 South of Arlington to Highway 287, there seems to be lack of priority for this important link that will serve the new Superconducting Super Collider in Ellis County.

Concerning mass transportation, there needs to be an area plan to link up the major economic development centers of Fort Worth and Arlington with D/FW Airport, Dallas, Denton, and the SSC with rapid transit such as monorails.

Concerning the economic impact of D/FW Airport and Carswell Air Force Base, it is significant, but they have consistently failed to meet their Federal guidelines for involving Minority Businesses. The major difficulties for minority businesses is the large size of the contracts and the strict bonding requirements. We recommend two thing: (1) Breakdown large projects and contracts into smaller units; (2) create a Federal Bonding Pool or relax bonding requirements for minority businesses.

Concerning HUD's Community Development Block Grant Funds, we have administered an economic development program for small, minority, or woman-owned businesses for ten years. Recently HUD has begun to actively discourage economic development programs that retain jobs and create jobs for low and moderate income persons. Their method is to require impossible documentation, such as, (1) to claim job retention, you must prove the businesses filed bankruptcy or has been operating in the red for years, and they must supply legal or IRS documents; (2) to claim job creation, the business must require each new employee to submit a self-certification of the number in the family and the income of each person in the household before they took this new job. Since 80% of small businesses fail in the first 5 years and since the collapse of a business in a depressed area has a greater negative impact as other businesses will probably not locate there, let it suffice for job retention that a business be in its first five years or be located in a depressed area. And since there are types of jobs normally held by low and moderate income persons, let it suffice for job creation that these new jobs are the type that are normally held by low and moderate income persons with requiring confidential disclosures or invading the privacy of new employees.

Concerning area pollution, we recommend that the federal government actively encourage the use of Natural Gas by Public Transportation Companies and Trucking Companies and School Districts and anyone using a large number of trucks, buses, or other vehicles. Some federal incentives or tax credits or awards presentations would be appropriate.

Suite 300 North Fort Worth Bank Bldg. Fort Worth, TX 76106 (817) 625-5411

TESTIMONY BEFORE
THE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
UNITED STATES HOUSE OF REPRESENTATIVES

by

MR. ARNOLD W. OLIVER, P.E.
ENGINEER-DIRECTOR
TEXAS STATE DEPARTMENT OF HIGHWAYS AND PUBLIC TRANSPORTATION

Fort Worth, Texas
August 8, 1990

Good afternoon, Mr. Chairman. Once again, I want to thank you, Congressman Geren, and the other members of your committee for the support you have provided for Texas highways and bridges over the years. With your help, we have built one of our nation's foremost highway systems.

I want to thank the Committee for giving Texans an opportunity to talk with you again this afternoon about our infrastructure accomplishments and our needs. I'm here today to highlight the highway and bridge issues that we believe are particularly important to Texas.

Texas today has a population of about 16 million people. We expect to reach a population of about 20 million during the next decade. Until 1940, we were a predominantly rural state--about 80 percent of our people lived in rural areas. Today, however, that picture has reversed. About 80 percent of all Texans are urban residents. That means that we are about 5 percent more urbanized than the national average.

To serve this expanding population base we have the largest highway system in the country--about 305,000 miles of highways. We have about 14 million registered vehicles--almost 1 vehicle for every Texan. Our highways carry about 150 billion vehicle miles of traffic annually.

We have as many miles of farm-to-market roads--about 43,000 miles--as there are miles of interstate highways in the nation. We also have more bridges--about 46,500--than any other state in the country. Too many of those bridges--particularly those on local roadways--have deteriorated or are obsolete. We are concerned about the increased costs to our businesses from lengthy detours around these bridges. But we are perhaps more concerned about the increased risks our children and our sick families and friends face when our school buses and our emergency vehicles have to take these same detours.

During the past several years, we have made travel on Texas highways safer than ever before. In 1970, 5.2 people died for every 100 million miles driven in Texas. In 1989, that rate had fallen by 60 percent, to 2.1 people for every 100 million miles. We have been pleased to note the Federal Highway Administration's increased emphasis on safety in developing its highway reauthorization proposal to the Congress. We agree with FHWA that the safety aspects of highway decisions must be timely and appropriate, and must be fully integrated into the project development process.

The increasing urbanization of Texas demonstrates the "national imperative" of Texas highways, and why federal assistance must continue. That assistance must reach out beyond today's Interstate highways. Texans must also receive a fairer return on their federal highway user fee dollar. Today, Texas receives almost a billion dollars a year in federal highway funding, which represents about 80 percent of our federal user fee payments into the Highway Trust Fund and only about a third of the department's annual budget. And our total funding from all sources--state and federal--will cover about 60% of our identified highway needs.

We agree with the American Association of State Highway and

Transportation Officials (AASHTO) that the first federal priority should be to preserve the highway system we now have. To replace our 77,000 mile state-maintained network would take more than $100 billion. We can't afford to start from scratch.

To better enable Texas to meet the challenges facing us, we must have a simpler, more flexible federal program structure. The underlying responsibilities of the federal government for national defense, interstate and international commerce, and the safety and mobility of our people must shape the federal role in transportation. However, federal involvement should support, not inhibit, the unique creativity and expertise that marks each of our states. Federal "red tape" should not keep our roads and bridges from being upgraded.

In this light, we join with the American Association of State Highway and Transportation Officials in recommending a two-part program structure--a "categorical" or "focused" program and a "flexible" program--for both highways and public transportation. This two-part structure would continue to address national needs, but would also allow states the flexibility to determine and address local needs. This plan would allow our highly competent state highway agencies the flexibility necessary to determine the best use of limited resources to preserve and expand our national and local transportation infrastructure.

There are many other issues affecting highways and bridges in Texas which need to be discussed. We believe that those that we have raised today are the major issues of concern to the more urban areas of Texas.

In conclusion, I want once again to thank the Committee for the opportunity to appear. Thank you.

My name is James M. Oliver. I am General Manager of Tarrant County Water Control and Improvement District Number One. Our organization was created in 1924 in response to a devastating flood in 1922 that inundated Fort Worth. Since then, the role of the District has increased to include supply of raw water to thirty customers throughout ten counties in North Central Texas. The District owns and operates four major water supply reservoirs as well as operates and maintains the Fort Worth Floodway which is a system of levees and flood control structures along the West and Clear Forks of the Trinity River.

For the past two consecutive springs, the District's water supply reservoirs and the Fort Worth floodway have been hit by flood events brought on by record rainfall for this region. In both 1989 and 1990 average annual rainfall totals (approximately 32 inches) were reached throughout North Texas by June.

The District's four reservoirs were all designed as water supply reservoirs. Each has only a small amount of usable temporary flood storage capacity. The District owns all real estate beneath the reservoirs. However, the District owns only a flood flowage easement above the design elevation of the lakes. This provides for a small amount of usable temporary flood storage capacity. Inasmuch as the District owns only an easement above the design elevations of these reservoirs, property owners have been able to construct homes and other improvements in these flood flowage easements.

The development around the reservoirs located northwest of Fort Worth on the West Fork of the Trinity River experienced considerable damage as a result of these recent flood events. Also, flooding occurred along the Fort Worth Floodway as well. Residences located in several sump areas along the Floodway were flooded due to high flows in the river which prevented water that collected in the sumps to flow into the river. These sumps were designed for only a fifty year flood event. Development in the adjacent urban areas has decreased the level of sump protection due to the loss of valley storage. Increased volumes of water now moves more quickly into the sump areas. When the river stage is above the water level in the sumps, water cannot flow out of the sumps.

The area between the terminus of the Fort Worth Floodway and the Dallas Floodway experienced heavy flooding as well. This area has never been channelized or protected.

The two consecutive years of serious flooding in the Upper Trinity River Basin have accentuated the need for additional flood control planning for the region. The Fort Worth District of the U.S. Army Corps of Engineers has recently completed a Reconnaissance Study that identified several structural and non-structural alternatives that would alleviate flooding problems in the Upper Trinity River Basin.

The recommended alternatives, several of which impact our District's existing flood control and water supply structures, will receive further study in a Feasibility Study to be initiated by the Corps of Engineers in September. This five year $7.5 million study will evaluate these proposed alternatives. The study will investigate potential levee improvements along the Fort Worth Floodway as well as evaluate the performance of sump areas and their impact on interior drainage. Finally, the study will evaluate a potential flood control reservoir on the West Fork of the Trinity River between our District's Bridgeport and Eagle Mountain Reservoirs near the City of Boyd.

If built, the Boyd detention structure will serve to store flood flows on the West Fork of the Trinity River. The structure will have no water supply function. However, there would be a water quality improvement because the flood control structure will trap sediments that would normally contribute to the siltation of downstream reservoirs. Water supply releases from Lake Bridgeport would be allowed to pass through to Eagle Mountain Lake.

The flood control storage provided by a Boyd detention structure would assist in the storing of flood waters and the timing of flood releases from reservoirs throughout the Upper trinity River Basin as well as help protect the District's Bridgeport and Eagle Mountain Lakes from flooding. Also, the Corps' Feasibility Study could recommend a structural alternative such as Boyd in lieu of other possible downstream improvements and extensions of the existing floodway.

The Feasibility Study is scheduled to commence in September. Should this study recommend structural alternatives within the operational area of the District, the District would consider serving as a local sponsor of any program pursued by the Fort Worth District of the U.S. Army Corps of Engineers. Thank you for the opportunity to speak before you today.

STATEMENT

Before the Committee on Public Works and Transportation
U.S. House of Representatives

August 7, 1990
Fort Worth, Texas

by:

HERSHEL PAYNE
BOARD OF DIRECTORS
TEXAS HIGH-SPEED RAIL AUTHORITY

Chairman Anderson, members of the Committee, I thank you for the opportunity to appear before your committee on the subject of high-speed rail transportation. As a member of the Board of Directors of the Texas High-Speed Rail Authority, the state agency with responsibility for evaluation of high-speed rail project applications, I would like to speak on the role the federal government can have in promoting this new transportation mode.

I would first like to explain the work of our agency. The Authority was created by the Texas Legislature in 1989, and the majority of the appointments to our board of directors were made by the fall of 1989, while my appointment was made official early this year. We have been in active operation since April, 1990. In late June of this year, we solicited letters of intent from groups wishing to apply for a franchise to design, construct, operate and finance a high-speed rail facility in Texas. Our application process will proceed with an issuance of a Request for Proposals for applications this fall; applications will be accepted in early 1991, and a decision will be made on franchise applications by May or June of 1991.

The franchise will be fully funded from private sources; there is no state funding provided for this project. Our agency has powers of eminent domain which can be used on behalf of a franchisee, but all costs of the project will be borne by the private sector. Despite the absence of subsidy, two consortia, composed of American and international firms representing French and German rail systems respectively, are very interested in placing a system in Texas. Texas' topography in the region between the state's most populous urban areas is ideal for a high-speed rail system. The existing and projected patterns in air and highway traffic, coupled with the population projections for the near future, indicate that high-speed rail transportation could serve as a complementary mode to move people and goods in Texas. These and other reasons have attracted serious inquiries from internationally respected corporations which seem eager to invest in this project. Given that a Texas high-speed rail facility will be a private venture, it will be up to the applicants to decide which cities will be served in their application, and what technology they will use to offer these services.

The applicants' decision on technology will be left to market considerations, since the financing will be purely private. The timing of their decision may preclude consideration of U.S. maglev technology, a matter of concern to those members of Congress currently interested in federal legislation to promote a domestic maglev industry. While our statutory franchise process may inhibit the application of U.S.-based maglev technology, please be assured that our invitation for high-speed rail project applications is completely open to any groups willing to propose construction of a maglev system in Texas.

In my opinion, the current discussions about the relative merits of rail-based and maglev systems overstates the importance of rolling stock in the decision to proceed with high-speed rail projects. Rolling stock costs account for a fraction of the overall costs of a high-speed rail project. The majority of the costs of a high-speed rail facility are in engineering and fixed system costs. These services and products will be provided for the consortia in Texas by local suppliers, contractors, and engineering firms to a large extent. The majority of the jobs created--both in construction and operations--benefit Texans.

Texas is also interested in the potential for licensees to manufacture rolling stock in our state. Given our fast application process, we hope to have an operational high-speed rail system by the end of the decade. Texas could then be poised to become a magnet for high-speed rail ancillary operations, which create jobs for our citizens. We must not forget that any kind of high-speed rail system, regardless of the technology of the rolling stock, has significant economic benefits to our citizens.

A high-speed rail facility would not only bring economic benefits in the creation of jobs; the addition of high-speed rail increases the capacity of the total intercity passenger transportation system, providing economic benefits to the travelling public. Current delays and congestion in the air and on our highways have discrete, definable economic costs. High-speed rail can meet some of the increasing travel demands of Texans into the next century, and diminish the overall societal costs of passenger transportation.

Congress has a major task looming ahead in 1991: the reauthorization of the federal-aid highway program. As the nation approaches the end of the Interstate era, the federal government is faced with an opportunity to redefine its role in how it assists states in highway construction and maintenance. The growing problems of highway congestion, limited rights of way for highway expansion, and increasing pressure to limit automobile-related air pollution also lead to the reconsideration of the importance of public transportation providers in the federal program for surface transportation.

As you can see, the consideration of highway reauthorization bills will involve evaluation of the effects of such legislation on other transportation modes. For this reason, I applaud Transportation Secretary Samuel Skinner's efforts to develop a national transportation policy. Such a policy recognizes the interconnectivity of all modes of transportation. In this regard, high-speed rail can be an important additional asset in the nation's total passenger transportation system. High-speed rail is not intended to supplant commercial aviation any more than light rail transit systems are designed to replace all highways: they're all part of a transportation *system*. High-speed rail is an essential element in a national strategy to promote intercity passenger transportation during the coming century.

Our state agency is charged with responding to critical transportation needs of the present, by comparing the costs and values of existing technology versus emerging technology.

Our state does not wish to be an experimental proving ground for any technology; we want a successful operating system which can meet the critical transportation needs of today, and support itself in the process. How then can the federal government help high-speed rail transportation in Texas and throughout the nation?

1. Continue development of national maglev industry. The plans outlined in the recent U.S. Army Corps of Engineers report on the National Maglev Initiative propose an ambitious but judicious approach to maglev development in the U.S. The development of U.S. maglev systems can benefit Texas in that there may be intercity corridors which could be efficiently served by maglev systems. Maglev and high-speed rail should be considered as complementary, not competing, technologies.

2. Provide direction in interagency cooperation, particularly in joint right of way use. The recent maglev feasibility report of the Federal Railroad Administration makes no cost estimates on right of way acquisition for maglev systems, assuming that states would provide right of way at little or no cost as an inducement for construction of a high-speed rail system. Even if Texas planned to offer existing right of way for high-speed rail projects (no plans exist), we would need greater cooperation between the Federal Highway Administration and FRA on any joint use arrangements. Recent statements from officials with the American Association of State Highway and Transportation Officials indicate that highway officials have serious concerns about joint use of right of way. That issue must be resolved, and should be done at the federal level. The resolution of the matter benefits all high-speed rail technologies, so long as the issue is approached in such a way that both technologies are accommodated.

3. Provide financial mechanisms which promote all types of high-speed rail. Rep. Walgren's H.R. 4515 limits availability of loan guarantees to high-speed rail systems completely made in the United States. Other high-speed rail legislation also seems directed solely at maglev system development. We would hope that whatever form of financial incentives are provided, that they will be available to all high-speed rail technologies.

4. Improve tax-exempt financing. This is one major area in which benefits could accrue to both types of high-speed technology. Our agency has no authority to issue tax-exempt bonds for a Texas high-speed rail system. Even though there are incentives for using tax-exempt bonds for high-speed rail, the stifling ceilings on private activity bonds currently in effect limit the benefits of those incentives. This means that a state agency, if it had tax-exempt financing authority, would have to push aside other private activity issues in the state, which have substantial merit on their own, during the period of project construction. If the federal government is interested in high-speed rail, then it could provide avenues for tax-exempt financing which do not require high-speed rail projects to compete for artificially scarce private activity bond resources.

5. Treat High-Speed Rail differently than other rail transportation. Despite rail deregulation, the FRA retains an important role in regulating rail passenger safety. We appreciate the ground-breaking work being done by the Florida High-Speed Rail Commission and the FRA in developing rail-based high-speed safety and operating standards. The progress being made is due in large part to the wholehearted endorsement of high-speed rail by FRA Administrator Gilbert Carmichael. We applaud these efforts and encourage the federal response to its legitimate safety responsibilities to recognize that high-speed rail transportation is fundamentally distinct from existing rail passenger service. The operational characteristics of high-speed rail transportation dictate that high-speed rail should not be governed by a set of regulations intended for slower, older trains.

In summary, we commend this subcommittee for your interest in high-speed rail transportation. I encourage you to take actions to develop federal high-speed rail policies which benefit all high-speed rail technologies. We feel that high-speed rail technology, such as may be proposed in Texas, represents a significant step forward in passenger transportation from a consumer standpoint. A successful franchisee will be offering transportation consumers a completely new choice, something no one in this country can provide now. Rail-based high-speed technology is misappropriately named as existing technology by many--we must remember that nothing like it exists in this hemisphere.

Our board is committed to seeing that Texas is the first state to implement ground passenger service in excess of 150 miles per hour, should our review of the applications we expect prove that a franchise is in the public convenience and necessity. We look to the federal government to join us in facilitating this project.

Statement of Terry Ryan

FORTWORTH CHAMBER

The Impact of Infrastructure on the Nation's Productivity, Economic Growth and Competitiveness

If you think back 200 years, rivers, lakes and seaports determined our commerce centers and lines of distribution. One hundred years ago it was railroads. Today it's airports and highways.

Infrastructure investments have historically vitally contributed to our nation's economic growth and well-being. Recent economic research has tied the level of public infrastructure spending, federal, state and local, to the productivity growth rate in the private sector. However, during the last 20 years our public works have been shortchanged. Total public spending on infrastructure has dropped from 3.6% of GNP in 1960 to 2.6% in 1985. While spending on operations and maintenance has remained a constant share of GNP, capital spending has dropped from 2.3% of GNP in 1960 to 1.1% today. The relative share of public works spending at all levels of government declined from nearly 20% of total expenditures in 1950 to less than 7% in 1984. Many economists feel this underinvestment and slow growth rate of our productivity means trouble ahead as other nations surpass us.

Communities face similar problems. When corporations consider cities for relocation, infrastructure is an important factor. In the new site selection for the U.S. Bureau of Engraving and Printing/ Western Currency Plant, D/FW International Airport played a critical role. The expansion of this airport is the most important economic issue facing the Fort Worth/Dallas area today.

At the same time, Fort Worth Alliance Airport has attracted the American Airlines Maintenance Base to Fort Worth. This industrial airport is expected to draw many corporations to Fort Worth, creating thousands of new jobs for this area.

Accessibility, whether it be through airports or highways, is one of the most important criteria for the location of businesses. For example, the Woodhaven area of Fort Worth, for all practical purposes, was isolated by inaccessibility and was in decline. Opening the highway interchange access with bridges and ramps in the area spurred a resurgence of development which reversed the decline, added jobs and improved the quality of life for the thousands of residents and businesses.

Impacting the future of Fort Worth and Tarrant County are:

- Expansion of the runways at D/FW International Airport.
- Expansion of I-30, I-20, I-35, SH 121 (Airport Freeway), and SH 287 from Dallas/Fort Worth to the Superconducting Super Collider.
- Construction and development of a high-speed rail system within the State of Texas, connecting 5 of the 6 major cities and encompassing the bulk of 17 million people.

Each dollar invested in infrastructure is returned many times over. As taxpayers experience an increase in net taxes paid, they look for a "return on their investment". Spending on infrastructure, as it creates jobs and services, provides a high yield on that investment. It promotes the work ethic rather than handout programs.

In order to remain competitive in the world economy, we must constantly invest in our productive capacity as a nation and community by continuing to improve infrastructure demands. Delaying these expenditures only means paying a higher price in the future.

Statement of Jack Sasser

GOOD AFTERNOON -

AS YOU PROBABLY ARE AWARE, THE FEDERAL AVIATION ADMINISTRATION LOOKS AT AVIATION ON A SYSTEM-WIDE BASIS. THAT IS TO SAY, WE CONSIDER THE AIRSPACE SYSTEM, OUR SYSTEM OF AIRPORTS, NAVIGATIONAL AIDS, SECURITY, AIRCRAFT, AIRMEN, AND ANYTHING ELSE HAVING TO DO WITH AERONAUTICS.

THE NATIONAL SYSTEM IS DEPENDENT ON AN INTERRELATED STATE, REGIONAL, AND LOCAL SYSTEM. IT IS COMPRISED OF MANY SMALLER SYSTEMS ALL FITTING TOGETHER IN

CONCERT TO FORM A TOTAL NATIONAL SYSTEM. IN THE DALLAS/FORT WORTH METROPLEX, OUR SYSTEM REVOLVES AROUND THE DALLAS/FORT WORTH INTERNATIONAL AIRPORT. TO A LARGE EXTENT, EVEN THE ECONOMIC SYSTEM OF THIS AREA REVOLVES AROUND THIS AIRPORT.

OUR CURRENT PLAN FOR THE DFW AREA IS CALLED "THE METROPLEX PLAN" WITHIN THE FEDERAL AVIATION ADMINISTRATION. THIS PLAN INVOLVES NOT ONLY THE LOCAL SYSTEM BUT THE IMPACT OF ALL OF THE OTHER

MAJOR SYSTEMS THROUGHOUT THE COUNTRY. ANYTHING THAT AFFECTS DFW AFFECTS THE NATIONAL SYSTEM. FOR EXAMPLE, IF WE HAVE BAD WEATHER AT DFW INTERNATIONAL AIRPORT, FOR A PERIOD OF ABOUT 6 HOURS ON ANY GIVEN DAY, AFTER THE COMPLETION OF ONE NEW RUNWAY AND WITH AN ANTICIPATED 13% INCREASE IN TRAFFIC, DELAYS ACROSS THE NATION WILL INCREASE BY 16%. THIS IS A VERY SIGNIFICANT PIECE OF THE TOTAL PICTURE. THE METROPLEX PLAN WAS DEVELOPED BY THE FAA SOUTHWEST REGION IN 1987 IN AN ATTEMPT TO DEAL WITH

CAPACITY INCREASES NECESSARY TO ACCOMMODATE AERONAUTICAL ACTIVITY IN THE TWENTY-FIRST CENTURY (2010). IT HAS BEEN REVISED AND EXPANDED SEVERAL TIMES SINCE THEN. CURRENTLY SOME OF THE COMPONENTS OF THE METROPLEX PLAN INCLUDE:

1. RELOCATION OF THE FOUR CORNERPOST NAVIGATIONAL AIDS (VORTAC'S).
2. INSTALLATION OF TWO ADDITIONAL NAVAIDS. (VORTAC'S TO SERVE ONLY DFW.)

3. CONSTRUCTION OF TWO ADDITIONAL ATCT'S AT DFW.

4. SIGNIFICANT EXPANSION OF THE EXISTING TERMINAL RADAR APPROACH CONTROL FACILITY. (TRACON/60,000 SQ. FT.)

5. INSTALLATION AND UPGRADE OF THE EXISTING RADAR SYSTEM TO INCLUDE A TOTAL OF FOUR RADAR SENSORS. (TWO NEW/ADDITIONAL)

6. EXTENSION OF TWO OF THE EXISTING RUNWAYS.

7. CONSTRUCTION OF TWO NEW RUNWAYS WITH

8. FOUR NEW INSTRUMENT LANDING SYSTEMS AND ASSOCIATED APPROACH LIGHTING SYSTEMS (MALS/RAIL).

OUR METROPLEX PLAN ALSO CONSIDERS ALL OTHER PARTS OF THE AIRSPACE/AIRPORTS SYSTEM FOR A NINE-COUNTY AREA WHICH INCLUDES DALLAS, TARRANT, PARKER, ELLIS, JOHNSON, ROCKWALL, DENTON, COLLIN, AND WISE COUNTIES. THERE ARE 245 AIRPORTS IN THESE NINE COUNTIES OF WHICH 46 ARE OPEN TO THE PUBLIC AND 199 ARE PRIVATELY-

OWNED RESTRICTED USE (199 INCLUDES HELIPORTS AT HOSPITALS). THE OTHER AIR CARRIER AIRPORT IN THIS METROPLEX, DALLAS LOVE FIELD, HAS ALREADY BEGUN REHABILITATION OF ONE RUNWAY AND ANOTHER IS PLANNED. WE ARE IN THE PROCESS OF CONSTRUCTING A REPLACEMENT AIR TRAFFIC CONTROL TOWER AT LOVE FIELD. I'M SURE YOU ARE FAMILIAR WITH THE SATELLITE AIR CARRIER AIRPORT STUDY. THE FIRST PHASE (FEASIBILITY) HAS JUST BEEN COMPLETED BY THE NORTH CENTRAL TEXAS

COUNCIL OF GOVERNMENTS. THE SECOND PHASE, WHICH WOULD INCLUDE SOME SITE SELECTION, IS PLANNED SOON. THE DALLAS/FORT WORTH METROPLEX ALSO INCLUDES TWO VERY UNIQUE TYPES OF FACILITIES:

1. THE GARLAND HELIPORT A NEW FACILITY IS NOW OPEN AND IS A UNIQUE FACILITY FOUND ONLY IN A VERY FEW MAJOR METROPOLITAN AREAS.

2. THE FORT WORTH ALLIANCE AIRPORT WHICH IS UNIQUE UNTO ITSELF IN THAT IT IS

THE FIRST INDUSTRIAL AIRPORT BUILT FROM THE GROUND UP FOR THAT PURPOSE. YOU HAVE READ RECENTLY OF THE ACTIVITY CURRENTLY AT THAT AIRPORT. IT FAR EXCEEDS OUR EXPECTATIONS AND REPRESENTS A NEW CONCEPT FOR ADDED CAPACITY, SYSTEM RELIEF AND ECONOMIC IMPETUS FOR THE METROPLEX, AS WELL AS THE NATION. WE ESTIMATE THE TOTAL AVIATION NEEDS OF THE METROPLEX TO BE 150M EXCLUSIVE OF DFW AND ANY POSSIBLE NEW AIR CARRIER AIRPORT. ASSUMING CONTINUING

LEGISLATION, WE WOULD CONSIDER FEDERAL FUNDING OF APPROXIMATELY 120M.

NOW WE COME TO ADDRESS THE QUESTIONS OF WHAT DO WE NEED TO BE DOING TODAY? WHAT ARE GOING TO BE THE NEEDS THAT WE SHOULD ADDRESS FOR TOMORROW? AND HOW DO WE GET THERE? THESE ARE QUESTIONS THAT THE CRYSTAL BALL GAZERS CONTINUOUSLY ASK.

VERY BRIEFLY, WE NEED:

1. AIRPORT MASTER PLAN UPDATES (CONTINUOUS PLANNING PROCESS/NEW

RUNWAY DEVELOPMENT, ETC.).

2. LAND USE PLANS (LAND SET ASIDE FOR INDUSTRIAL/ECONOMIC BENEFITS).

3. NOISE AND HEIGHT ZONING AND PLANNING.

4. ENVIRONMENTAL ZONING AND PLANNING.

5. PLANNING AND BUILDING OF THE NECESSARY INFRASTRUCTURE/CONSTRUCTION TO SUPPORT NEW DEVELOPMENT (ACCESS ROADS, PUBLIC TRANSPORTATION, HOTELS, AVAILABLE SKILLS IN JOB MARKET, ETC.).

6. COORDINATED OVERALL METROPLEX PLANNING (COORDINATED AMONG ALL INVOLVED ENTITIES).

7. ESTABLISHMENT OF JOINT OVERSIGHT GROUPS (FOR SPECIFIC FUNCTIONS; I.E., ENVIRONMENT, NOISE, HEIGHT, AIRPORT DEVELOPMENT) AND FINALLY, AND

8. MARKETING OF THE DALLAS FORT/WORTH METROPLEX.

THANK YOU.

PRESENTED BY
MR. WM. JACK SASSER
DEPUTY REGIONAL ADMINISTRATOR
FEDERAL AVIATION ADMINISTRATION

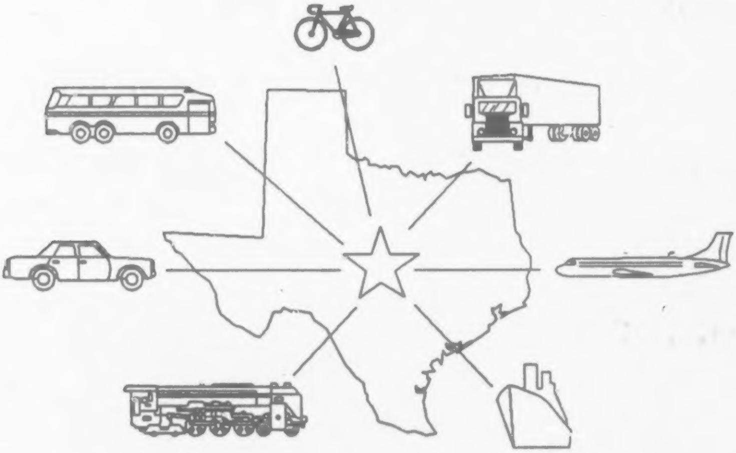
Public Transportation

TRANSPORTATION 2020:
THE TEXAS PERSPECTIVE



DEPARTMENT OF HIGHWAYS
AND PUBLIC TRANSPORTATION

APRIL 1990

TRANSPORTATION 2020:

The Texas Perspective

AMERICAN TRANSPORTATION AT THE CROSSROADS

On September 30, 1991, the current federal surface transportation program will expire. Over the next several months, the Congress will have the opportunity to rethink the mission of federal surface transportation programs, and to reshape those programs into new programs for today's needs. New transportation ideas must redirect federal transportation programs to meet the challenges of a rapidly approaching new century. The Congress now faces choices that will guide us for the next several decades.

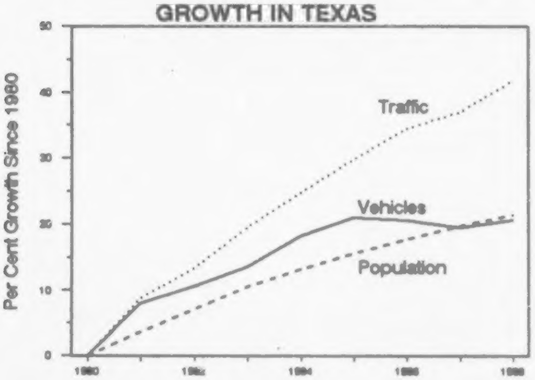
. . . the time has come for a new federal transportation program.

Today, the Interstate Highway System is essentially complete. We have united our nation through the effective movement of people and goods. During the past 35 years, however, Texas and our nation have both changed significantly. We have become more metropolitan, and face new economic and environmental challenges. The new Federal-aid Surface Transportation Assistance Act must support our full participation in the global marketplace.

During the past decade Texas' transportation challenge has become acute. Our population is growing faster than that of the nation as a whole. Approximately 80 percent of Texans live in urban areas, where congestion is already a serious problem. The opening of new bridges and ports of entry with Mexico have brought increased traffic at all border crossings. The growing number of *maquiladoras* (twin plants, one on either side of the Mexican-Texas border) has significantly increased commercial traffic in the Rio Grande Valley. Freight passing through Texas seaports increased by almost 20 percent between 1985 and 1987. We expect that demands on our infrastructure will increase significantly during the next 20 years.

. . . Texas transportation is under increasing demand.

The Texas Perspective



GROWTH IN TEXAS

Our ability to compete effectively in that marketplace is the challenge presented to our surface transportation system. Texas must be able to use all the resources available to it to address our most important transportation needs:

- Preserving our existing system
- Improving mobility through increased capacity and reduced congestion
- Preserving and enhancing safety.

To better enable Texas to meet these challenges, the new Federal-Aid Surface Transportation Assistance Act must:

- **Restructure the federal-state partnership and the current federal-aid program**
- **Revise the formulas through which federal funds are distributed to the states**
- **Increase the levels of federal transportation funding.**

. . . the new federal policies must . . .

The Texas Perspective

THE ADMINISTRATION PROPOSAL

The current federal administration has recommended a fundamental restructuring of the federal transportation program:

- Giving priority to preserving needed transportation infrastructure
- Maintaining a high level of transportation safety
- Increasing the emphasis on integrated state, local, and regional transportation planning
- Ensuring that transportation systems of national significance have the new capacity that is essential to meet critical national needs
- Focusing federal assistance on selected highways of "national significance"
- Shifting to the states an even greater share of the cost burden for building and maintaining the nation's highways and public transportation systems
- Funding transportation improvements through increased user fees, including tolls
- Increasing the rate of expenditure from the Highway Trust Fund
- Increasing state flexibility to design solutions to their transportation problems
- Eliminating federal funding for mass transit operating costs
- Increasing the flexibility in federal financing for other public transportation projects
- Making sound infrastructure management a condition for federal aid.

. . . the administration's proposal -- one approach.

The Texas Perspective

Today, about 70 percent of total funding for both highways and public transportation nationwide comes from state and local governments.

Texas has more highways (more than 306,000 miles of highways, roads, and streets) and more bridges (over 46,500) than any other state. Nearly 14 million registered vehicles travel about 150 billion miles annually over those roads. And they travel more safely than ever before. In 1970, 5.2 people died for every 100,000,000 miles driven in Texas. In 1989, that rate had fallen by 60 percent -- to 2.1 people for every 100,000,000 miles.

The Texas highway system . . . a major investment.

	Texas Today	Texas 2009
Population	17,641,350	21,970,309
Daily Vehicle Miles Traveled	423,000,000	657,000,000
Highway Lane Miles	306,276	396,330
Motor Vehicles Registered	13,621,925	17,183,100
High Occupancy Vehicle Lane Miles	37.1	170.8
Ferry Boats	10	14
Intracoastal Barge Tonnage	72,979,000	86,000,000

Dollars spent on transportation do not take money out of the economy; they bring money in! For every public dollar spent to build and operate the nation's roads and bridges, private firms and individuals spend $15. And highway expenditures may also be the best investment Texas can make to attract industry -- better than reducing taxes.

. . . paying major dividends.

The Texas Perspective

THE FEDERAL ROLE

National defense, interstate and international commerce, and the safety and mobility of our people -- these underlying responsibilities of our federal government should shape the federal role in transportation. However, federal involvement should support, not inhibit, the creativity that marks the uniqueness of each of our states. Current program limits and requirements often prevent the most efficient use of federal dollars. Regardless of funding level, the future federal role in the transportation partnership with the states should be simple and flexible.

. . . beyond national imperatives . . . the federal role should support the states.

HIGHWAYS

Rather than the complex structure of the current federal-aid highway program -- which spreads federal highway funding among more than 35 funding categories -- Texas advocates a simpler federal program structure. We join with the American Association of State Highway and Transportation Officials (AASHTO) in recommending a two-part program structure -- a "categorical" or "focused" program and a "flexible" program -- for both highways and public transportation.

. . . a simple and flexible program.

The Highway System of National Significance (SONS) Program

The basic reasons for federal involvement in transportation demand a national highway system that is limited in size but critical to the economic health and international vitality of Texas and of this nation. A single, new categorical highway program would address the needs of this Highway System of National Significance (SONS).

. . . the SONS must reach new population centers and markets.

The existing 42,800-mile Interstate Highway System would remain the heart of the planned 150,000- to 180,000-mile Highway System of National Significance. However, the SONS must reach out to new population centers and new markets -- to cities like San Angelo, Brownsville, McAllen, and Harlingen. These new economic centers are far from

The Texas Perspective

Interstate routes designated more than 30 years ago. The SONS must also provide safe, efficient highways linking our ports of entry with our major urban centers.

The Highway System of National Significance would extend beyond the Interstate system to include appropriate principal arterial highways. Each state would designate its principal arterial segments to be included in the SONS, following a process established by federal law or regulation. Selection would be based on criteria that reflect national transportation objectives. The U.S. Department of Transportation (USDOT) would review and approve the state-designated segments.

. . . SONS selection criteria are based on national objectives.

About 13,000 miles (8 percent) of a SONS would be in Texas -- all the current 3,300 miles of Interstate highways, plus about 10,000 miles of principal arterials.

We are not suggesting an expansion of the Interstate Highway System. Segments of the SONS beyond the Interstate would not necessarily be built to Interstate standards.

Texas recommends that the actual designation of SONS components should take place after the SONS program is created and its funding levels established. Funding apportionments to a state for its SONS program would be based on statewide factors other than SONS-system mileage. Thus, the SONS would be decoupled from the formula factors and avoid incentives for a particular state to inflate the size of its SONS segments.

. . . state SONS funding not based on state SONS mileage.

The Flexible Highway (FLEX) Program

National interests in transportation extend beyond the Highway System of National Significance, however. Urban and suburban congestion costs us $73 billion each year, including billions of dollars in Texas alone. Texans in small cities and rural communities need safe and efficient access to the SONS. All Americans deserve consistent safety and quality standards on those highway systems supporting the SONS, and smooth connections among the different forms of transportation.

Especially on this supporting highway network, each state and local government should have the flexibility to meet its unique mix of rural and urban transportation needs.

Through the FLEX Program, the federal government should provide funding assistance to the states for rural and urban highway needs beyond the SONS. States should also have the flexibility to use these funds to meet their public transportation needs.

. . . increased flexibility will lead to more effective programs.

This increased flexibility ensures the best use of limited federal resources to preserve and expand our transportation infrastructure. Through the support of the Federal Highway Administration (FHWA) the state highway agencies are now highly competent. These capable state professionals are also closer to their own highway problems than either the Congress or USDOT. They can create more effective solutions, and can balance the use of resources among competing needs more effectively.

Project Selection

The structural changes recommended above should eliminate the need for Congress to use "demonstration projects" to address important transportation needs. For example, gaps in today's complex national transportation assistance structure have required Congress to create projects to provide highway access to air and water ports. Under the structure Texas and AASHTO recommend, these projects could be addressed readily through the SONS Highway Program.

. . . the need for demonstration projects is diminished.

Any other projects of special congressional interest should be authorized by Congress, if at all, only when they meet certain funding and program criteria. Those projects should have:

- High priority in the statewide program of projects
- High priority in the local jurisdiction

- State and local agencies willing to share appropriately in project costs based on expected project benefits.

Any demonstration projects established by the Congress within these criteria should be funded from a state's current apportionment of obligational authority.

Accountability

The new federal-aid highway program should assure the Congress that federal funding improves the performance and capacity of the nation's transportation system. Texas agrees with the administration's National Transportation Policy that sound infrastructure management should be a condition for federal aid. Texas recommends that Congress require each state to prepare and implement four principal transportation management plans:

. . . assurance that funding will improve the system

- A pavement management plan,
- A bridge management plan,
- A safety management plan, and
- A congestion management plan.

Any federal planning process should allow for the diversity among the states. Each state should be able to prepare and implement its plans using criteria appropriate to its particular circumstances. The plans should be dynamic, multi-modal, and strategic in approach, and should be amendable without sanctions. State reports on the implementation of these plans should substitute for other program controls, such as performance measures, to assure the Congress that federal funds are being used to improve the highway system.

Program Funding

Texas agrees with AASHTO's recommendations on the distribution of federal highway funds among programs. First, a sufficient portion of the total federal funds provided for highways should be set aside initially for a modest (not to exceed 2 percent of total highway funding) discretionary bridge program, emergency relief, and federal lands roads program. The remaining funds should be divided equally between the SONS Program and the FLEX Program.

PUBLIC TRANSPORTATION

Neither Texas nor AASHTO seeks major changes in the current structure of federal assistance to public transportation. We support the American Public Transportation Association (APTA) recommendation to expand the types of projects eligible for federal funding assistance through the current formula program. Formula funding should be available for operating assistance to public transportation programs in rural and small urban areas, and for rehabilitation of existing systems and new transit service needs beyond major metropolitan areas. In addition to traditional bus and rail transit projects, formula funding should be available for high-occupancy vehicle (HOV) lanes, traffic signal improvements, capital improvements to commuter rail, and transportation system management efforts targeting ride-sharing and transit.

. . . support AASHTO & APTA recommendations

We agree with AASHTO's recommendation that substantial federal financing for public transportation should continue. Public transportation in Texas would be best served if General Revenue funding continues for "formula" public transportation programs (Urban Mass Transportation Act Sections 9, 16b, and 18). We also believe that funding for the Urban Mass Transit Administration's discretionary program should continue at its present level. Any increase in funding for the federal public transportation program from the Mass Transit Account of the Highway Trust Fund should be distributed by formula. (See below.)

. . . continue funding "formula" public transportation programs from general revenue.

The Texas Perspective

FEDERAL FUND DISTRIBUTION FORMULAS

Consolidating and reshaping federal transportation programs to reflect more effectively our national goals is essential, but not the final answer. The formulas allocating federal program funds to the states were created for another era. Many are based on outdated factors such as land area and rural postal delivery route mileage. Perhaps they were appropriate for Texas and for America in the 1920's. Then, our goal was "getting the farmer out of the mud." Today, one of our challenges is getting a Houston businessman holding an international airline ticket through gridlocked roads to the airport.

. . . present formulas are inequitable.

HIGHWAYS

Texas agrees with AASHTO that, in the shift to a new program structure, no state should experience a reduction in basic federal funding. The new Federal-Aid Surface Transportation Assistance Act should ensure that each state will receive at least as much in total federal highway funding under the new program as it received in fiscal 1991, assuming that all states had completed their Interstate highway systems. This minimum funding threshold would not include any Interstate Completion funding above the one-half percent minimum, or any discretionary or demonstration project funding.

. . . states must be assured of continued and stable program funding levels.

The SONS Program

Texas recommends that a particular state's share of SONS Program funding should be determined using factors that correlate well with those basic national interests served by transportation. This is critical if sound public policy is to guide the states in designating their SONS segments.

. . . national interests must drive allocation of SONS funds.

The Texas Perspective

Texas supports AASHTO's recommendation that the formula for the state-by-state distribution of SONS Program funds use the following factors:

- Total statewide urban and rural lane miles
- Total statewide urban and rural vehicle miles travelled (VMT)
- "Other appropriate factors."

AASHTO did not specify what these "other appropriate factors" should be, or indicate what weight should be given to each of the factors. However, support for interstate commerce, and the national economic benefits that flow from such support, is one of the principal national interests upon which federal support for transportation rests. Texas believes that factors reflecting the intensity of heavy truck travel should have significant weight in the SONS Program allocation formula. Including heavy truck travel as a factor would respond to the major impact trucks have on highway design, construction, and maintenance. It would particularly help compensate several western states for the heavy wear and tear on their roadways which serve as a "bridge" for truck traffic between other states.

We believe that diesel fuel consumption is the best available indicator of commercial or heavy truck travel. Diesel consumption data are consistently collected and relatively accurate. Therefore, Texas recommends that diesel fuel consumption be accepted as the "other appropriate factor" in the SONS Program allocation formula.

. . . distribution of SONS funds must be equitable and effective.

The Texas Perspective

Each of these factors should be assigned a weight in the SONS Program allocation formula so that available funds will be distributed equitably and effectively. The formula should:

- Provide states with the federal funding to meet future transportation challenges without sudden disruptions in their current programs
- Ensure that Texans receive a fair return on their transportation investment. For many years, Texans have received significantly less than $1 in federal transportation funding returned to the state for every $1 in transportation taxes and user fees they paid to the federal government.

Texas proposes an allocation system which would distribute SONS Programs funds:

- Two-ninths based on total statewide rural lane miles and vehicle-miles travelled (VMT)
- Four-ninths based on total statewide urban lane miles and VMT
- Three-ninths based on total statewide diesel fuel consumption.

To ensure equity and prevent program disruption, we also recommend three minimum funding level guarantees:

. . . minimum funding levels must be established.

- Each state should receive at least one-half of 1 percent of total SONS apportionments
- Each state should receive a percentage of total SONS apportionments that is at least 85 percent of the percentage of estimated tax payments into the Highway Account of the Highway Trust Fund attributable to highway users of that state
- Each state should receive at least a 25 percent share of any percentage increase in total program size.

The Texas Perspective

To ensure that states with a low population density receive adequate SONS Program funding to address their special problems, Congress should consider providing a "low population density" supplement to the SONS Program allocation formula.

The FLEX Program

While providing critical support to important national mobility needs, the FLEX Program pursues objectives that are predominantly related to the state and local transportation system. Thus, Texas agrees with AASHTO that transfer of funds between states, such as through the allocation formulas suggested for the SONS Program, would be inappropriate in the FLEX Program. A "donor-donee" relationship among states should be avoided. Each state should simply be allocated a *pro rata* share of total FLEX Program funds based upon the share of total federal highway user contributions to the Highway Trust Fund attributable to that state. That is, under the FLEX Program, Texas would receive a 100 percent return on its federal transportation investment.

. . . a donor-donee relationship should be avoided.

To ensure fairness in distributing FLEX Program apportionments, Congress should require each state to allocate a portion of its FLEX Program funds to non-state systems. The portion of FLEX Program funds allocated to those systems, in the aggregate, should initially be no less than the percentage of FY 1991 apportionment of urban funds, secondary funds, and bridge funds made available to non-state systems in that state. Future allocations to non-state systems should hold constant the ratio of a multi-year moving average of aggregate funding to rural non-state systems to a similar average of aggregate funding to urban non-state systems.

The Texas Perspective

Transfer of Funds Between Programs

No formula can completely accommodate all the differing needs among the states. Texas therefore supports AASHTO's recommendation that each state should have the discretion to shift up to 20 percent of a state's total highway allocation (that is, both SONS Program and FLEX Program funds combined) either way between the SONS Program and the FLEX Program. Of course, a state exercising this option should be required to inform FHWA of the transfer.

. . . a shift of up to 20%

Interstate Program Transition

Although we recommend eliminating the Interstate Highway Program as a special program category, we recognize existing federal commitments to that program. For the Highway System of National Significance to function, the Interstate Highway System must be completed. An estimated $3 billion to $5 billion beyond current authorizations will be required to complete the designated Interstate System, including about $130 million in Texas.

. . . to complete the Interstate.

Therefore, we recommend that a transitional Interstate Completion Program be continued as a category separate from the SONS Program. That program would complete those Interstate segments included on the 1989 Interstate Cost Estimate. Approximately $1 billion per year be made available to the states for Interstate completion between 1992 and 1996. These funds should remain available for obligation and expenditure indefinitely.

The Texas Perspective

PUBLIC TRANSPORTATION

Texas recommends that any increase in the public transportation program funding from the Mass Transit Account of the Highway Trust Fund be distributed to state and local governments by a new formula. Any increased funding should be distributed:

. . . equitable distribution of public transportation funds.

- One-half according to the current Section 9 formula, and
- One-half based on that state's relative portion of the nation's population.

The Texas Perspective

INCREASED FEDERAL FUNDING

To remain a leader in the world economy, America must invest the funds necessary to preserve and improve its surface transportation infrastructure. Since 1960, however, the percentage of our GNP invested in our transportation infrastructure from all sources has fallen more than 50 percent. And the share of national infrastructure spending funded by the federal government has dropped more than 25 percent – from 31 percent to 23 percent.

The collapse of several major bridges during the last decade is a grim warning of the consequences of the declining rate of investment in our transportation infrastructure. Highway use has increased dramatically. Traffic has escalated by about 40 percent since 1983; yet in 1990, America will spend less for highway improvements than we did then.

. . . the infrastructure needs are obvious and overwhelming.

Arbitrary limits on the availability of federal funds for obligation have kept almost 40 percent of the user fees in the Highway Trust Fund from being put to work. We must make that money available now to move goods and people. At a minimum, all federal transportation user fees, and the interest they earn, should be put to work immediately to improve transportation.

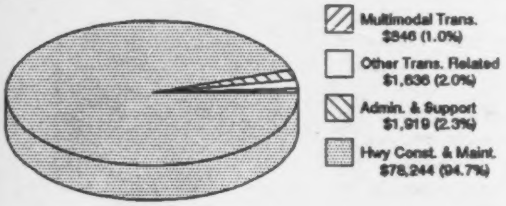
Transportation infrastructure is closely connected to economic vitality. In 1815, when most roads were rutted paths impassable in wet weather, the cost of moving goods 30 miles inland equalled the cost of moving them across the Atlantic. All-weather macadamized roads and other transportation improvements cut those costs by as much as 90 percent.

. . . increased federal funds could make the difference.

The Texas Perspective

Today, our transportation infrastructure is wearing out, and the cost of moving goods to markets threatens our economic competitiveness. Infrastructure investment needs in Texas are staggering: an estimated $82.6 billion (in 1988 dollars) during the next 20 years. These needs are vital to our economic well-being.

Twenty-year Fiscal Requirements in Millions (constant 1988 dollars)



If we assume a cost of operation of 50¢ per mile, it costs $182,000 each year if 200 trucks a day are required to detour five miles around one structurally deficient bridge. If 2,000 cars must also take the detour each day, the cost is an additional $730,000 annually. And today, more than 240,000 of America's 575,000 highway bridges -- 16,000 in Texas alone -- are structurally deficient and should be closed or restricted to light traffic, or are functionally obsolete.

Texas agrees with AASHTO that the level of federal investment in highways and public transportation must be increased. However, we believe that this increase in federal investment should not require an increase in federal highway user fees until four conditions are satisfied:

....no increase in federal user fees now.

- Reaffirm the dedication of the receipts from current and future federal highway taxes and user fees to transportation purposes. We must keep "trust" in the Highway Trust Fund.

The Texas Perspective

- Make the full balance of the Highway Trust Fund (limited only by the anti-deficit provisions of the Byrd Amendment) available to the states for obligation. The U.S. General Accounting Office estimates that highway commitments could be increased by $7.4 billion without violating the Byrd Amendment.

- Repeal the exemption of ethanol-blended gasohol and other alternative fuels from 6¢ of the current 9.1¢ per gallon federal excise tax on gasoline. This "free ride" for certain highway users cost the Highway Trust Fund $650 million in revenue in 1987, and more than $3 billion since 1979. The annual cost to Texas is approximately $28 million in allocated apportionments.

- Improve the effectiveness of collection procedures for the federal motor fuel tax. Despite recent changes in the federal highway tax collection mechanism, the Highway Trust Fund continues to lose hundreds of millions of dollars each year through organized tax evasion and inadequate collection procedures.

Highways

If these steps are taken, federal funding for highways can be increased significantly for the next several years without raising the federal excise tax on motor fuels. Texas endorses AASHTO's recommendation that the federal highway program be increased from its current level -- approximately $13 billion annually -- to approximately $18 billion in fiscal year 1992. At that funding level, Texas would receive approximately $1.3 billion, an increase of about $350 million over FY 1990 funding levels. With AASHTO, we further recommend continued gradual increases to approximately $26 billion in fiscal year 1995. Texas would receive approximately $1.9 billion, an increase of almost $1 billion over FY 1990 funding levels. These increases -- until at least 1994 -- are available without new federal revenues.

. . . all we ask is a reasonable spending level.

The Texas Perspective

Public Transportation

Although Texas recommends that substantial federal financing for public transportation should continue, we do not support APTA's recommendation to increase the federal excise tax on motor fuels to fund public transportation.

The Texas Perspective

MEETING THE CHALLENGE

If the new Federal-Aid Surface Transportation Act implements our recommendations, the State Department of Highways and Public Transportation will:

- Accelerate the development of the Texas Highway Trunk System, interconnecting all of Texas
- Reduce urban congestion through the Principal Arterial Street System
- Manage urban roadways more efficiently through Traffic Management Systems

The Texas Highway Trunk System

The Texas Highway Trunk System will be a rural four-lane divided network connecting all major population centers, major ports of entry, and significant military installations in Texas. The 9,000- to 11,500-mile trunk system will serve all cities with over 20,000 population. Most of that system will probably coincide with Highway System of National Significance. All Texas cities with populations of 10,000 and over will be within 25 miles of the trunk system.

. . . connect all major population and economic centers.

The Texas Highway Trunk System will make Texas highways safer and Texans more mobile. It will increase economic prosperity throughout Texas, and open Texas to increased tourism.

The Principal Arterial Street System

The Principal Arterial Street System is an ongoing program to reduce congestion in large cities. Major thoroughfares and streets that serve and relieve an urban freeway system may be included. We plan to use state revenues to fund two-thirds of the total amount needed for the program. The balance would be federally funded.

The Texas Perspective

Traffic Management Systems

In many urban areas, it is impossible even to add lanes to existing highways. Those areas need Traffic Management Systems to manage the roadways more effectively. Traffic Management Systems will be implemented in the six largest Texas urban areas over the next 10 years. The systems will include surveillance, communication and control systems along freeways, and signal control systems along arterials. These systems are a first step toward Intelligent Vehicle/Highway Systems (IV/HS). Full implementation of Traffic Management Systems will require approximately $41 million a year for construction over the next 10 years.

. . . move more traffic through better management

The Texas Perspective

THE BOTTOM LINE

Today, Americans enjoy the convenience and economic benefits of a transportation system second to none. This system was made possible largely through a long-standing cooperative partnership among federal, state, and local governments.

Today's economic world is more competitive than ever. A safe, high-quality, highly efficient transportation network is needed if our state and nation are to remain competitive. Such a network is essential to the mobility of the American people and to their ability to ship American materials and products. These activities are basic to our quality of life.

Good transportation alone is not the only answer; but it is essential.

Our country now has a choice. We can work and plan our way into a successful future. But we must act quickly to meet the new transportation challenge of tomorrow. We must:

- **Restructure the federal-state partnership and the current federal-aid program.**
- **Revise the formulas through which federal funds are distributed to the states.**
- **Increase the levels of federal transportation funding.**

To keep Texas moving tomorrow, we must set our direction today!

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

WEDNESDAY, AUGUST 8, 1990

House of Representatives,
Committee on Public Works and Transportation,
Atlanta, GA.

The committee met, pursuant to call, at 9:40 a.m., in the City Council Chambers, City Hall, Atlanta, Georgia, Hon. Glenn Anderson (chairman of the committee) presiding.

Present: Representatives Anderson, Lewis and Jones.

The Chairman. The meeting of the committee will come to order. I want to say good morning.

The Committee on Public Works and Transportation hearing on the future of our Nation's infrastructure needs will come to order. And I want to welcome you here today and thank you for taking time from your busy schedules to share with us your concerns, your knowledge and perspectives about this important issue.

This year, our committee initiated a series of events designed to give us a better understanding about our Nation's infrastructure crisis. At our first event in Washington, we looked at emerging infrastructure needs from a national point of view. Our second and third events focused on the impact of infrastructure on the productivity, the growth and the ability of our country to compete in international markets. Future events will include hearings on infrastructure financing alternatives and new technologies.

It is very important, however, for us to get a good look at the infrastructure problems encountered at the State and local levels. Our meetings today here in Atlanta and this afternoon in Conyers are two of several planned at various sites around the Nation. We want to review infrastructure needs with the people most directly involved and to hear a broad range of ideas that can help resolve the problems.

It is a great pleasure for me to join John Lewis for this hearing, and I would like to thank him and the people of the Fifth District for their generous hospitality. John has, for more than a quarter century, dedicated his life to protecting human rights and shaping what he calls "the beloved community", a world community of peace, justice and brotherhood.

John serves on the Interior and Insular Affairs Committee and is a knowledgeable and effective member of this Public Works Committee, serving on the Subcommittees on Surface Transportation, Public Building and Grounds and Aviation. John is an important figure in American history. As a close associate of Dr. Martin

Luther King, Jr., he has been in the vanguard of leadership for social change since the demonstrations, sit-ins and freedom rides of the 1960s. His commitment to human rights was a part of the effort that eventually led to the passage of the Voting Rights Act of 1965.

John has been effective in supporting legislation to aid the homeless, to improve the Nation's transportation systems and to increase small business opportunities. He was instrumental in pushing legislation to set aside not less than 10 percent of all airport construction contracts for small and disadvantaged businesses and most recently he has authored a study on presenting sewerage overflow in local creeks on the Chattahoochee River.

And John knows that when we talk about infrastructure, we are talking about the real cornerstone of our cities and communities. Though it may not be an exciting subject, it is infrastructure that provides the foundation for a sound economy, it creates jobs and is at the very heart of the standard of living and quality of life that Americans enjoy or aspire to.

From our hearings thus far, we know that not only do many problems exist with our public works facilities, but we have been short-changing our public works investments for more than 20 years. The question we ask today is what about Georgia's infrastructure? How adequate is its network of public facilities—roads, bridges, public buildings, sewers and wastewater treatment facilities, water supply facilities, dams and other public works—to meet current needs?

In addressing this, we should all keep in mind that economic research in recent years has tied the level of public spending on infrastructure to the productivity growth rate in the private sector. The United States productivity growth rate fell from 1.8 percent annually in the 1960s to less than one percent, to .7 percent, in the early 1980s, and during the same period the annual growth rate of investment in infrastructure fell from 4.5 percent to again less than 1 percent, to 0.8 percent.

Now productivity in our country is growing much more slowly than in other developed countries such as Japan, West Germany, Canada, France, Italy and the United Kingdom—some of which incidentally invest on a per capita basis almost five times as much in their public works as does the United States.

Today, we look to you to help us gain further insight into your infrastructure needs—what is the condition of and how adequate is your infrastructure to meet current and anticipated needs of the area?

Who do you think should pay for necessary public works and what financing techniques have you considered? What do you think the Federal role should be? Or the State role? Or the local role? And last, what should our committee be doing to resolve some of these problems?

As we continue our inquiry and debate on how to deal with the current and anticipated needs of our public works, we look forward to your answers and to your questions that you may raise.

Because of the number of witnesses we have scheduled to testify, I ask you to please summarize your statements in two or three minutes. Your written statement will be included in its entirety in the hearing record.

John, would you like to make an opening statement?

Mr. LEWIS. Thank you, Mr. Chairman.

Mr. Chairman, let me just take a moment to welcome you to Atlanta, welcome you and the staff from the Public Works and Transportations Committee to Atlanta, to the Fifth District, to the great State of Georgia, to what we call the Capitol of the New South, a city that we hope will become the capitol of the 21st century. Mr. Chairman, I appreciate you taking the time to travel to the Fifth Congressional District of Georgia to learn firsthand of the infrastructure needs and concerns of Georgians.

I would also like to thank each of the witnesses here today who will share their views and recommendations about rebuilding our infrastructure.

Finally I want to welcome everyone here in attendance who has taken time out of their busy schedules to attend this hearing and demonstrate an interest in these important issues.

No community can survive, yet alone thrive, without addressing basic infrastructure needs. The network of public facilities—roads, bridges, airports, rail, mass transit and wastewater facilities—forms the basis of our economy and helps determine the quality of life that we enjoy.

Many studies have shown a direct link between the amount of resources that we commit to the nation's infrastructure and the prosperity of our economy. Atlanta is no exception. Atlanta's history and the tremendous growth of this city over the past 50 years shows us that infrastructure investment in roads and highways, in airports and in rail transportation, went hand in hand with growth.

For Atlanta's continued prosperity, we must continue to address today's infrastructure challenges and needs. We must be committed to using the vast resources of this nation to rebuild America as we move toward the 21st century.

We must repair our roads and bridges. American citizens should not have to tolerate dilapidated highways and bridges.

We should have also an adequate supply of water. Without the necessary water resources, we will not have continued economic development, nor growth.

I welcome this opportunity to hear from our elected and appointed officials and our many community representatives, and I look forward to hearing your testimony today.

Thank you again, Mr. Chairman, and welcome to Atlanta and to the Fifth District.

The CHAIRMAN. Thank you, John.

Our first panel this morning consists of elected officials in the Atlanta area—Mr. Fred Etris, Mayor of Union City; Mr. J. Clark Boddie, Mayor of the City of Palmetto; Mr. Bruce Bannister, Mayor of East Point; Mr. Michael Lomax, Chairman of Fulton County Commission and finally, Mr. Rick Anderson, Executive Officer for Administration and Development for the City of Atlanta. Would you come up and take your places—I hope you are all here. And I think the first one that I will recognize is Mr. Fred Etris, is Mr. Fred Etris here?

Okay, Mr. Lomax, we will recognize you first.

TESTIMONY OF MICHAEL LOMAX, CHAIRMAN, FULTON COUNTY COMMISSION; HON. FRED ETRIS, MAYOR, UNION CITY, GA; RICK ANDERSON, CHIEF FINANCIAL OFFICER, CITY OF ATLANTA, GA

Mr. **Lomax**. Thank you very much, Mr. Chairman and my good friend, our Congressman from the Fifth District, John Lewis.

I want to join in welcoming the committee to Atlanta and in encouraging you in the effort that you are undertaking to gain information from leaders in the public and private sector on the local level with respect to these infrastructure issues.

I have lengthy testimony to provide for you and place into the record, much of which focuses on the actual activities which Fulton County has undertaken over the last decade and projects to undertake over the next decade with respect to infrastructure improvements.

As a major urban government in the State of Georgia, we are completing over one billion dollar capital improvement program much of which has been focused on providing infrastructure that will ensure our ability to maintain the level of growth which has occurred in this community and to meet projected future growth in the 1990s and well into the 21st century.

Unfortunately the efforts that we have undertaken have been undertaken without the significant involvement of the Federal Government, and if I have one plea to leave you with this morning, that would be that the Federal Government rejoin local and State governments as an active partner in addressing infrastructure needs across these United States.

Regrettably, those initiatives which we undertake, are undertaken largely at local encouragement without Federal participation and support. We have had an advantage which other areas across the United States have not had, and that is that we have been able to experience significant growth in its tax base, population, private investment over the last several decades. I shudder to think what our capacity would have been to meet the demands for improved highways, rapid transit, wastewater and water treatment, were it not for the fact that we have a growing and expanding tax base and a dynamic economy. And I think that those local governments across the country where they have not been so blessed have obviously met with a much more difficult time.

I would like to conclude my informal remarks with a comment which I was not certain would be appropriate, but since our Congressman focused on the fact that the availability of water is a major issue for us, nationally as well as locally, I want to underscore that we find ourselves here in metropolitan Atlanta in perhaps one of those Catch-22 situations which is deeply, deeply disturbing to us.

After having made substantial, significant investment over the years in our water treatment and wastewater treatment facilities, Fulton County and the City of Atlanta spending $60 million to construct the largest water treatment plant in the State of Georgia, we are now faced with the prospect of not being able to operate it, not being able to withdraw the water necessary that is flowing through our community to provide drinking water for our community, because the Federal Government has not been as active and involved a partner as it needs to be.

We have a dynamic, growing economy here in metropolitan Atlanta. It is the heartbeat for not just the metro area, but for the entire State and much of the southeastern region. We have water available to us, but because of misunderstanding, miscommunication and lack of coordination with the Federal Government, we now face the prospect of having built the infrastructure but not being able to use it because we cannot withdraw the water and have not been permitted to do so by the Corps of Engineers.

I believe you will be hearing more about this from the Atlanta Regional Commission. It is a matter of grave concern to the future of metropolitan Atlanta and the State of Georgia. It is not always that we are asking you for money with respect to infrastructure, oftentimes what we are asking from you is more communication, better understanding, cooperation and coordination.

I do not think any of us expects to return to those days of yesteryear when we could count upon the Federal Government to come in with 90 cents on every dollar, as we did with respect to the building of our transit system, but I do think that there is a role, a leadership role, a directive role, a coordinating and a cooperative role which the Federal Government can play to assist local governments in meeting our infrastructure responsibilities.

Again, thank you for being here. I have more formal testimony to present and I am delighted to be here and to have an opportunity to speak to you, Mr. Chairman, and to our two fine Congressmen who represent Fulton County; one the southern and central portion, Congressman Lewis and to the north our fine Congressman Ben Jones.

Thank you.

The CHAIRMAN. Well thank you very much. We will hear the others before we get to our questions, so do not go away, there will be some questions probably.

Mayor Etris.

[The prepared statement of Mr. Lomax appears on p. 1136.]

Mr. ETRIS. Honorable Congressmen, Mr. Chairman, it is an honor to be here and I want to begin by saying I endorse Mr. Lomax' statements. He has pointed out the need for the Federal Government to get back with us, and it is something that we all are looking forward to with the tax base and everything, and our structures that we have got in the area, but I look forward to the leadership of Michael and his staff.

But I want to speak something on the small municipal governments. We need as much help—transportation is one of the greatest assets that you can have to bring business and infrastructure into our communities and our small cities like Union City. We have a lot of things—for instance, we have got a connector street that goes from S.R. 14 and 29 highway into our greatest business section, and growing fast in south Fulton County in Union City. But we have to secure a right-of-way to connect downtown where our City Hall and all of our government places are. And this street would mean more to the prosperity, if we could get grants through the County—Michael and the Commissioners have always been very cooperative in helping divide up all of the proceeds that come from grants and other things, but small municipalities cannot grow without we have adequate transportation arteries connecting our businesses all in one point.

It is an honor to be a mayor of a growing city, as Union City is. We started out and now we—our tax base has way over tripled in the last 8 years. It is something, and we pay a lot of taxes, but it takes all of us to realize that we have got to have some more help from our—where our tax base goes to the Federal, the county and the State. We need it in our small municipalities. South Fulton is one of the finest places that we have got in Georgia right now for growth and for prosperity.

I want to thank you all. This public hearing is one of the greatest opportunities that all of our municipalities and our counties can have to express our desires. Thank you.

The CHAIRMAN. Mr. Lomax, I am told you may be in a tough time. We have one more person I would like to hear from, but how soon do you have to leave?

Mr. LOMAX. My Board meets in two minutes across the street. I think though that they normally are a little slow getting started, so if we need to hear from Mr. Rick Anderson and you have some questions, I can manage that.

The CHAIRMAN. Could you do it kind of fast, Mr. Rick Anderson?

Mr. RICK ANDERSON. Yes, sir.

The CHAIRMAN. Good.

Mr. RICK ANDERSON. Thank you, Mr. Chairman. I am actually the Chief Financial Officer of the City, and on behalf of Mayor Maynard Jackson, who is out of town and unable to be with you this morning, I would like to add my welcome to Atlanta, to the committee and thank you for giving us the opportunity to present some of our views on the infrastructure issues and problems.

In Atlanta, we certainly recognize the importance and necessity of cooperative effort with Federal, State and local governments to ensure that cities and counties are equipped to address the needs of their citizens, and we stand ready to do our part.

As financial officer, I am always concerned about the tendency of people to have a narrow focus on infrastructure. The things that have been mentioned already—water and sewer systems, transportation systems—are always thought of as infrastructure, but I advocate a definition of infrastructure which is broader and which includes all the capital facilities through which local government provides its important services to citizens. That includes such obvious things as fire stations, police precincts, detention facilities, and things which are not quite so obvious such as recreation centers, gymnasiums, swimming pools, police and fire training facilities and a whole set of facilities that people rarely if ever think of; vehicle maintenance facilities, sanitation substations, the facilities from which thousands of city employees who maintain and construct infrastructure operate from.

These capital facilities are vital to the provision of our services and in aggregate represent a significant financial requirement which winds up competing with the larger and more basic infrastructure projects for the precious resources available at the local level.

My written testimony will include some detail of some of the problems that Atlanta faces and give you some idea of the magnitude but just to very briefly touch on some of those; in the area of storm drainage, we have identified an estimate $125 million in costs needed to improve storm drainage in the drainage basins that serve the City of Atlanta. We have solid waste management and disposal problems that are very much typical of what you find in the rest of the country. We perhaps have a little more landfill capacity remaining than in many jurisdictions, but the basic needs remain; to minimize waste streams and recover resources from those waste streams.

In the transportation realm, we find that nearly 50 percent of the city maintained bridges are structurally or functionally deficient and in need of remedial work or replacement, and estimate that work to cost $200 million. We need a major upgrade of our traffic control systems. This project would have a great payback in terms of the savings and convenience to the traveling public as well as energy consumption reductions by more efficient movement of traffic. We have many obsolete mechanical traffic control systems which need to be replaced. That is a $40 million magnitude problem over the next ten years. And that is just sort of scratching the surface really of some of our infrastructure needs.

You can see that when we are talking about those magnitude of dollars and they are combined with other capital needs, our ongoing operating requirements and the needs of other jurisdictions which call upon the same tax base that you do, such as the Board of Education and the county government, these needs in aggregate really overwhelm the ability of locally raised revenues.

From my perspective as a city financial officer, I am greatly concerned with changes in the traditional funding of the development of local infrastructure. Much of the existing infrastructure in Atlanta was funded with heavy Federal participation, but today we find our Federal support virtually non-existent. General revenue sharing, which many cities have used for infrastructure improvements has been entirely eliminated. The HUD categorical grant programs of the late 1960s and early 1970s were consolidated in the community development block grant entitlement program, and we found in that consolidation that our funding levels for infrastructures were significantly reduced.

Since the inception of CDBG, our annual entitlement has shrunk from a nominal level of over $18 million to $9 million, superficially a 50 percent reduction. But when the impact of inflation is considered, our CDBG funding level is more like 20 percent of what it was 15 years ago. And we find that we have to stretch those dollars tighter and tighter and that less of that money is available for infrastructure.

In Georgia, direct State aid to Atlanta for infrastructure is mainly limited to highway projects so that the reduction of Federal support in that area must be made up through purely local dollars. To add injury on top of injury, we now hear Federal budget strategies discussed that would eliminate Federal income tax deductibility of State and local taxes and we find every year that we must be vigilant to ward off the tax deductible status of interest incomes from local government bonds. All of these actions would simply make it more difficult and more expensive for local governments to raise revenues locally to meet our infrastructure needs.

I believe there are compelling and sound arguments for major State and Federal participation in funding of local government capital facilities. I think Atlanta is a good example of the dynamics that are at work there. Atlanta contains roughly 20 percent of the population in the metro area but contains the major educational institutions, the regional hospitals, major religious institutions, regional recreation facilities such as stadia, major parks, the zoo, museums and is host to the capitol of the State government and major Federal facilities. Virtually all of the property involved in these activities is exempt from City of Atlanta taxes. The infrastructure necessary to support these facilities which serve the metro area, the State and in some cases the southeast region or national constituency simply cannot be paid for primarily by the taxpayers of the City of Atlanta.

While logic suggests that some of the funding inequities created by these roles can be corrected at the State level, the political reality is that is not the case to any great extent. Thus we have historically depended upon the Federal Government to provide some of the equity through distribution of Federal revenues.

In closing, we see a basic need for comprehensive and cooperative effort by the three levels of government to ensure that the needs of our citizens are met. Atlanta is committed to taking the steps we need to take to provide for infrastructure needs, but we need and solicit your support as you study the Federal options to address these critical issues.

Thank you.

The CHAIRMAN. Thank you very much.

Maybe I can direct a question to all of you and let Michael answer it first. My first question is, clearly infrastructure problems exist nationwide, but can you give us from a local perspective some idea of what steps you expect to take to meet your particular infrastructure needs and what kind of help you can expect from both the State and the Federal Government? Would you like to comment on some of that?

Mr. LOMAX. Thank you very much.

Over the last decade, Fulton County has undertaken about a one billion dollar capital improvement program and that has ranged from the rebuilding of our government center at about $200 million and rebuilding of our charity hospital at about a $300 million level to our jail at about $50 to $60 million and library system another $50 million. The remaining $400 million or so has been focused on traditional infrastructure improvements. The majority of those, wastewater treatment and water facilities, have been paid for through user fees and the ability of our government to expand treatment and—water treatment and wastewater treatment capacity has been a function of the ability of the user to pay. We anticipate because of substantial growth in portions of our unincorporated areas and incorporated areas to continue to invest significantly in wastewater treatment. That will be paid for through increasing rates that we charge the user.

I have to tell you that part of that improvement in the system is the result of just gross need of additional wastewater treatment capacity, but another part of it is to meet appropriate higher standards for treatment and discharge into the Chattahoochee River, which has been established by both the Federal and State governments.

With regard to transportation improvements, we find ourselves in a far more difficult situation and I would echo for us what Mayor Etris has said for the situation in the small community like Union City. We have no partners other than the State of Georgia when it comes to roads and streets, bridges, that is purely a local initiative. Fulton County is 80 miles long, Mr. Chairman, it has got ten cities in it including the City of Atlanta. We have unincorporated areas with populations in excess of 100,000 people, yet we have the ability to issue $3 million annually in general obligation bond debt for all of the infrastructure improvements that this county government would need to make. We cannot oftentimes condemn property associated with one transportation improvement for $3 million. We do not have the capacity from either the Federal or State government to issue debt, tax-exempt debt, for many of the infrastructure improvements unless we get voter approval. And if part of your job is to help raise the consciousness of the Congress with respect to the need for reinvesting in public infrastructure, I can tell you—and I am sure that that is a difficult job—I can assure you that raising the consciousness and educating the local citizens of the importance long-term of investing in public infrastructure is an even more difficult effort.

I want to underscore that while we have been successful in many of the ventures that we have undertaken because we have had growth in our tax base so that when we zone a piece of property we can say to the developer that if you want it, you have got to pay for the road improvements, and if you want it—using the exaction method of requiring that they help pay for those infrastructure improvements. Those techniques only work when the developer really wants to develop in your area. That works in an area which is a high growth area where there is a premium to be located there, but when it comes to other parts of our community where the infrastructure improvements need to be made, where we are trying to encourage growth and development, then the onus is entirely upon us to pay for those infrastructure improvements and oftentimes the private sector says we are not coming in there unless you pay for it, and we do not have the options available to us. The problems which we face locally I believe are magnified all across the country by other urban governments, whether city or county, which are trying to pay for these transportation and other improvements which in the past we have had support from the Federal Government on, today we have little or no support.

The CHAIRMAN. Well I know you have got to go, but I mentioned outside to one of the other people awhile ago, they asked me something along the same line, I told them one of the first things we try to do in Federal Government is make sure that you people at whatever local level you are on, try to do what the people in your district want. If you are a city councilman or mayor or State legislator or whatever, you should try to do whatever the people in your elected district want you to do, but at the same time you should work with those local agencies, whether it is agencies from the

State government or the legislative office or from your local county or your city. Then when you get all through the local—you know what the local people of your area or your community or your county or your State want, then do not forget us, because like in our committee, we have a good subcommittee and a lot of resources that are experts to some extent as members in those various things, at least leaders in it. And we have staff people who we hope are good staff, we think they are, and they become pretty good experts themselves. We have got subcommittees on aviation and highways and transit and public buildings and grounds and economic development—all kinds of things. So we are involved in many of the areas that might be of concern to you, but you bring them to us either directly or through your great Congressman here, he can bring them too. But if you do not bring them to him, he cannot bring them to us as good as he can if you do that.

But we want to be involved with you. We think sometimes we can help—not always with money, but sometimes we can help with ideas and things. So we do want to hear from you.

John, maybe that is a good time for me to kind of let you take over and ask.

Mr. LEWIS. Thank you, Mr. Chairman.

I do not have any questions for the good Chairman, Chairman Lomax and the good Mayor of Union City, Mayor Etris and Mr. Rick Anderson. I just want to thank you for being here and being willing to testify and give us your thoughts and ideas and recommendations on what we should be doing about the rebuilding of the infrastructure.

The CHAIRMAN. Ben, would you like to say something?

Mr. JONES. I would also like to thank our panel today. As you know, you are preaching to the choir here—in fact, we are all in the same choir, and this is a message that Congressman Lewis and myself find ourselves constantly repeating in Washington, of the crying infrastructure needs, particularly for this region, which has experienced such a tremendous growth. We need to constantly reemphasize the Federal role.

I appreciate you coming today to help lay out what the problem is and look forward to continuing to work with you on those solutions. Thank you.

The CHAIRMAN. I do not want to differ with what you said, but while I was out there a little while ago, and I was not looking for any questions, but I had four different people stop me and talk to me about the building of apparently a highway through a rather congested part of this part of the State right now, and they said what were we doing about it. I said, frankly, it seems to me this is something that should first be decided by you people out there, whether you want to do it. I mean that is why we elect people to the city council and mayors and county governments and State legislatures and governors and so on. We hope that they can kind of work something out. We can help them the best that we can, but I do not want to be the one that tells them you want a highway but you do not want to go through that part or move those houses or something. You people should decide that—they should discuss that themselves because it is their problem.

Mr. **Jones**. Mr. Chairman, we have been working on trying to settle that for some years now.

The **Chairman**. Four or five asked me about it.

Mr. **Jones**. There will be a resolution soon to that we hope and those are once again the kinds of problems that we experience, they are problems of growth here, and that particular project that I think you are referring to is a classic example of how often well-intentioned people find this conflict—you know, these are the kinds of things—and I agree, this is a matter that is going to be resolved, I think in the courts very shortly.

In talking to the panel, I think that the Federal role, as you point out, is to be supportive of those local decisions and on this particular issue, I think there is going to be a local decision before long and we will hear—perhaps today we will hear some testimony on the other side of this, but I am opposed to the Presidential Parkway as designed, and this is an area where I disagree with State transportation officials. The design of the Presidential Parkway is destructive to the intown neighborhoods, and I think would be better served by alternatives. The only road design I would support is a very limited access to the Jimmy Carter Presidential Library.

The **Chairman**. Thank you.

Mr. **Jones**. You will hear more about this one.

The **Chairman**. Good, good.

The next panel we will hear from today consists of Mr. Ira Jackson, Commissioner-Elect for the Atlanta Airport and representing Delta Air Lines is Mr. Harris Morris—just the two? Do we have Mr. Jackson and Mr. Morris—yes, we have them.

Mr. Braden, you represent the Atlanta Airport then?

Mr. **Braden**. That is correct, yes.

The **Chairman**. You may start, Mr. Braden.

TESTIMONY OF JOHN BRADEN, REPRESENTING ATLANTA AIRPORT; AND HARRIS MORRIS, ASSISTANT VICE PRESIDENT FOR PROPERTIES, DELTA AIR LINES

Mr. **Braden**. My name is John Braden, I am here to represent the airport and Mr. Jackson who could not be here today. In the interest of time, I will summarize his written remarks.

The remarks to you today concern the needs associated with maintaining our position in the world with respect to aviation, tourism, business development and the great progress our city has made in the past 30 years that are attributable to the airport. These are needs that can only be fulfilled through the continued cooperation between the Federal Government and the City of Atlanta. This of course, implies the importance of continuing Federal support for the nation's airports.

Our needs must be thought of in terms of short-term and long-term solutions; the first being the period from this year through 1995; the long-term being from 1996 through 2005.

Our short-term needs can be divided into the following categories: Building and service enhancements, airfield improvements and noise mitigation.

The first category includes expansion of the present terminal complex. These additions are primarily for the benefit of the passengers and will provide more open areas and concession space in the main terminal and each of the four domestic concourses. A small part of this is already underway. With the expansion we must include modifications to support facilities, roadway and parking improvements. We must upgrade our security system to meet new Federal requirements. We have scheduled cargo ramp improvements and a much needed expansion of our present Federal inspection services building. These items alone amount to about $84.5 million and only begin to address our needs. The largest and most expensive item in this category is the new international concourse which we hope to have under construction within the next 12 months. Though our current international concourse which has been doubled in size since the terminal opened in 1980, is not large enough to meet the expected demand in 1991, we cannot complete the new concourse which will cost $300 plus million before late 1993.

Airfield improvement needs fall into a "must do" category, pavement replacements and support facility improvements, but our most important need in this area is for the construction of a fifth parallel runway.

The last category for short-term needs is one of great pride to the City of Atlanta. It is our noise mitigation program, which has become a standard for airports worldwide. In order for us to complete the currently approved measures through Federal fiscal year 1996, we will spend almost $174 million. Of that, we expect Federal trust fund monies will provide $123.5 million. The balance will come from airport generated revenues and anticipated land sale proceeds.

Now let me turn to our long-term needs. Our airport enhancement program for 1996 through 2005 consists of airfield repairs, terminal building modifications and roadway improvements.

The noise mitigation program which is currently scheduled to be completed in Federal fiscal year 1998 will cost $61.8 million. We anticipate receiving $49.5 million of this amount from the Federal trust fund.

Finally, but of extreme importance to Atlanta, we are faced with the need for an additional airport to accommodate the growth of Atlanta and the area served by our airport. The Atlanta Regional Commission is currently conducting a study to determine the best site for this new airport which will be designed to supplement, not replace, Hartsfield. Many important decisions are yet to be made concerning the size of the initial phase of the second airport, but we know that we are faced with a minimum outlay of $400 million for this project. It is quite possible that by the year 2005, we may have to expend up to one billion dollars.

In closing, I would like to thank you for the opportunity to present this information to you. I look forward to working with you in the future, and I will be happy to supply you with any additional information which you may require.

The CHAIRMAN. Thank you very much.

Mr. Morris, do you want to make your statement?

[The prepared statement of Mr. Braden appears on p. 1084.]

Mr. MORRIS. Thank you, sir.

Mr. Chairman and members of the Committee, I am Harris Morris, Assistant Vice President of Properties for Delta Air Lines. Delta certainly appreciates this opportunity to provide the Committee with its view on aviation infrastructure issues important to the metropolitan Atlanta area. On behalf of Delta Air Lines, I want to comment Congressman Lewis for his leadership and his efforts on the Aviation Subcommittee to preserve the outstanding aviation system we enjoy in our great city. Atlanta has indeed been fortunate over the years in having civic and political leaders who have recognized the importance and value of the area's economic development associated with an efficient transportation system.

Delta has consistently advocated that the City of Atlanta, in concert with other governmental entities owning or operating airports, should maintain a strong, efficient and effective airport system to meet the needs of metropolitan Atlanta. Delta's position in this respect has not changed, although as a result of deregulation, many new factors must now be considered.

Delta strongly supports efforts to expand the capacity of Hartsfield Atlanta International Airport. The maximization of Hartsfield's capacity to maintaining Atlanta's position as a dominant hut and a growing international gateway serving the southeastern part of the United States. This expansion involves airfield, landside, airside and support facilities to meet these future demands and the growth. Airfield improvements will include a new commuter/air carrier runway, hold pads and other improvements in the airfield area to increase ground aircraft operational flexibility. FAA is currently conducting tests in Memphis and Raleigh-Durham Airports of a new radar system that is designed to enable simultaneous approaches on runways with a separation down to a possible 2,500 feet. The results of these tests have been very positive and installation of precision radar equipment at Atlanta would greatly enhance the airport's capacity and reduce delays as we proceed to maximize Hartsfield.

Delta believes that improvements to airside capacity would facilitate additional growth through the construction of new terminal space. We support the construction of a new concourse dedicated for international operations, known as Concourse E, and new federal inspection facilities to meet the needs of expected growth in international operations. Existing concourses and terminal facilities must be improved and expanded to enhance concession areas and airline/operational service areas in order for the entire facility to meet the growing needs of the area.

The Atlanta Regional Commission (ARC) is conducting a two-phase study to assess the need and methods by which additional aviation capacity can be provided to the metropolitan Atlanta area. Phase I of this study has been completed and concludes that the short-term alternatives are the maximization of Hartsfield as outlined above.

Although there are many conditions and criteria that must be evaluated as part of the Phase 2 site selection process, we feel that the review should concentrate on the four top criteria that have been selected by the ARC Project Advisory Team. These evaluation criteria are:

Proximity to passengers;

Flexibility to accommodate future demand;

Impact on Hartsfield air space and capacity; and

Potential for adverse environmental impact.

In other words, the most important objective in considering a site for a second air carrier airport serving the metropolitan Atlanta region is its ability to reasonably and conveniently serve the customer—that is, the flying public. Secondarily, the new airport site must hold the potential to be expanded to accommodate future demand. Delta feels that it is critically important that any future site not adversely impact the capacity of Hartsfield's present and future operations. We must maintain Hartsfield as a primary connecting hub and the international gateway for the southeast.

Delta continues to participate on the ARC Task Force Advisory Group and supports the selection of a potential second Atlanta air carrier airport site north of Hartsfield. The construction of a second air carrier airport north of Hartsfield should commence when it can definitely be determined that Hartsfield's capacity will, in the reasonably near future, no longer be able to appropriately handle all demand that will be placed upon it. Delta feels, based on a review of FAA capacity studies and FAA forecast data, that with a new commuter runway at Hartsfield, the current operational techniques used by FAA air traffic control would support 1.1 to 1.2 million annual operations without excessive delays. This volume is expected to occur well after the year 2000.

Delta hopes that its comments will be useful to the Committee's deliberations concerning the aviation capacity needs of our region. A strong, efficient and effective Atlanta airport system is of the utmost importance to Delta and Delta will continue to actively support efforts to preserve Atlanta's pre-eminence as an air transportation hub.

Thank you for this opportunity to appear at this hearing and we will be glad to answer any questions that you may have relative to our testimony.

[The prepared statement of Mr. Morris appears on p. 1173.]

The CHAIRMAN. Well, thank you.

If a federal infrastructure program was established with some of the money apportioned to communities on a formula basis and with the remainder allocated as the result of benefit/cost analysis with the best projects getting the most money, how do you think aviation projects would fare compared with highway, transit, sewerage and water supply projects?

Mr. BRADEN. We would hope, of course, that they would fare very well. Atlanta is a city whose main industry is transportation, so we require all these parts of the puzzle to fit together.

Aviation is very important from the standpoint of the modern business practices which require that people and commodities must move very quickly in order to meet the demands to today's business world. We feel that we can support the needs that we have in aviation. We are very lucky in Atlanta to have an airport that is very self-sufficient and it supports many of its own needs. We cannot, however, continue expanding without the help of the federal government and federal funds that we hope will be coming our way.

The CHAIRMAN. Well I was kind of wondering because I know as you travel to different cities in this country, you find different attitudes. It kind of shocks me when I go to Chicago or San Francisco or some of the others, which are pretty nice places, and I find they have a problem getting local support for local projects on their own airport. But they will admit to you that they should be doing something on their particular airport right now. Then you find others where the airport is kind of the number one thing out there with no problem at all.

Of course, you are on the Aviation Committee, your job is to smooth that all out. [Laughter.]

But anyway, that is the reason I kind of asked that question.

John, do you want to pick it up from there?

Mr. LEWIS. Yes. Thank you, Mr. Chairman. Let me just thank you for being here.

There has been a great deal of discussion in our Committee and the Chairman and members of the Committee have been very supportive on both sides of the aisle, both Democrats and Republican, of spending down the aviation trust fund. How would you like to see that fund used over the next few years, the aviation trust fund? We have quite a few dollars there that should be used, some of us think, to improve the airports around this country.

Mr. MORRIS. Congressman, if I may make a comment in that regard. I think it would simply be the spending of that money in accordance with the criteria for which it has been collected over the past years. It is an 8 percent assessment on the flying public, on their ticket price. It supposedly has been collected for a very specific purpose and we would like, and certainly endorse seeing the existing trust fund and future revenues collected from that passenger tax, to be spent for the improvement of the aviation system under the existing criteria for which it was collected.

The CHAIRMAN. I remember flying in some of these airports, and I mentioned two a moment ago, where I knew both of them needed work. But one of the things that was happening about this time—I guess we are talking now about 25 years ago when we passed that ticket tax—almost every time you would pick up the local paper in my area, which happened to be Los Angeles, but I know it was also true in Chicago and New York and elsewhere—almost every morning when you picked up the local paper, there was a near miss yesterday in the local airport—almost every time. And of course in my case, where I fly out almost every week, 43 trips I think last year—when you fly out that much, you hope that they are going to miss but you do not like the idea of having a near miss almost every time a plane takes off. And of course in Los Angeles one of those was not such a miss. I think we had 12 people killed.

So I was called in to a meeting by the California State Chamber of Commerce, and they said this was something we should do something about and they seemed to imply that they were the ones getting endangered because they said most of them were parts of corporations that had branches in San Francisco or Los Angeles or Seattle or Denver or New York or someplace else, and so they had to, as part of their business, fly almost every day from New York to Chicago or Chicago to St. Louis or wherever it may be, and almost every time they picked up the paper there was a near miss. And they said something has got to be done. So I met with a small group of them after that and I told them "well, except we do not have any money", because we did not have any money for it specifically. Well they said "tax us". I said, "What do you mean by that?" And they said, "Tax us when we buy tickets." And of course that is where the 8 percent ticket tax originally came from. And when we put it on, we put it in a separate fund and it was supposed to be spent 100 percent to make our airports safe in this country. But then it got into the situation like has happened to our highway trust fund and a couple of other trust funds, that they find if they get money in those trust funds and do not spend them, then they put that money, I guess on paper, alongside the deficit, it makes the deficit look better. I think right now—I am not sure of the figure, I have to check it every day—but I would take a wild guess that the deficit must be $25 to $30 billion sitting there between the highway, the transit and the airport trust fund. That is money we should be spending because every one of those trust funds—I know when I went on radio and television here a few years ago to raise the gasoline tax five cents, I remember there were three or four of us that went on that way. We said every penny of this is going to be spent for our highways and our bridges. But we did not—the money just sits there trying to make the deficit look better.

My theory is one of the things we have got to do is get the information sent to your local Congressman and Senator, but more important to the people in the administration, in the OMB, Office of Management and Budget. They are the ones who put the recommendation out to keep money in the trust funds because it makes our deficit look that much better.

I think it is an education job we have to do, and groups like you should do it, all over the country, because you know that money was collected for airports, to make them safe, and then when it just sits over there in the trust fund not even—I hope it is collecting some interest, but not doing very much. We should be spending it to make our airports safe. I just wanted to comment on that. Maybe I should not have, but I did.

Mr. **Morris**. Mr. Chairman, if I may have a response comment. We certainly agree with what you just said and we are attempting to participate in a very effective manner. I am sure you know Mr. Yoey, who is our representative in Washington. And in turn, in relation to the comment that you made about the local opposition to certain improvements and so forth at airports. I think that is one that certainly exists today, certainly stronger in some areas and some airports than others, and in your home state you certainly see it very strongly. I think that is an indication that there may very well be a serious need for some type of national noise policy that gives overall direction to avoid local restrictions, curfews, et cetera, that at a point in time will exceed the capability of the industry to meet.

Mr. **Lewis**. Mr. Chairman, let me just follow up by asking Mr. Braden, what is the position of the airport operators on spending down the aviation trust fund?

Mr. **Braden**. The position of the Airport Operators Council International and the Atlanta Airport is these funds have been taxed to the public and should be spent for that purpose. It is collected not only on tickets but also on general aviation fuel and air cargo shipments as well. Many people are paying a tax, the tax is going to Washington and being impounded there. We feel this is not the right way to deal with the public's money.

One of the solutions that has been proposed to this recently is a public facilities charge, a head tax on passengers. We have supported this in the belief that the federal trust fund monies are going to be kept in Washington and not spent for the purpose for which they were collected. We support the PFCs if the money is going to remain impounded. We would like, instead, to have these trust fund monies spent down, use the money for which you have it, that way we will not need the PFCs.

Mr. LEWIS. Thank you.

The CHAIRMAN. Congressman Ben Jones, you are on the Aviation subcommittee—we are kind of fortunate, we have two members of the Aviation subcommittee right here with us today.

Mr. JONES. Thank you, Mr. Chairman. I am glad you did editorialize about the trust funds because if you were not going to, I was going to. We are talking about a significant amount of money, what we are talking about is $8 billion that——

The CHAIRMAN. That is just in the airport trust fund.

Mr. JONES. That is just in the airport trust fund, not counting the highway trust fund which is also being used as something of a sham and a shell game to cover the true extent of the deficits and I think the American people long ago got wise to that game and so they are not fooling anybody with the budget tricks. But indeed we are being cheated because our money is not being used for what it was intended to be used for. So I got my two cents worth in on that and I will say amen to what you said.

I do have a question though—and we have made every effort whenever I get an opportunity—and I have signed legislation in terms of removing the highway trust fund from the budget and I do have to differ slightly about the PFC. I think that is just a—in my personal opinion, I know there are probably differences in your position sitting there—in fact, I know there are. But to me that is just another tax on top of a tax when we are already being taxed too much already. And I would like to see this money, first of all, spent for what it was intended to be spent for, before we tax the traveling public any more. And that was a tough call for a lot of us on the Committee.

My question is about a new airport. We talk about we can see ourselves to the year 2000 before we will reach the capacity level at which we will need another airport, or we, somehow at that point, stop growing. We stop developing or enhancing our capacity, and as you pointed out earlier, transportation is our lifeblood here in this region, and it is really our reason for existing. We are now becoming an international crossroads.

But my question is this, if by the year 2000 we have reached that capacity, do we not need to start building that—how long does it take to build a new airport? Now I think I can safely say that in this region there is support for a second airport, the disagreement is about where to put it. But we all know that we need to do whatever we can and support the growth of this area.

The **Chairman**. That is the situation everywhere. I can give you at least five to ten places who want another airport. But the question is where to put it. They have all got a similar problem to yours.

Mr. **Jones**. I think our problem is kind of a good one because there are a lot of positive areas and alternatives, and there are areas that want another airport—I mean that want to be the site of that second airport.

But my question is this, how much window of opportunity do we have now before we get—before we lose that opportunity to have another airport in place at the point at which it is projected it will be necessary? It seems like to me it takes quite awhile to build a major airport. So if we are talking about the year 2000, we need to start putting a shovel in the ground pretty soon, do we not?

Mr. **Braden**. We agree with that. We anticipate that Hartsfield will remain viable probably through the year 2005 at least. We are looking forward to new technology in the field of handling aircraft coming and going, and other improvements will extend the life of the airport. We are planning a new runway and some other enhancements that will keep Hartsfield a very viable airport even beyond the year 2005. But we do see the need for the second airport and we are making plans for it. In fact, we have been planning this airport since 1974.

We feel we are on track, we have to make some decisions very quickly, mainly as to where to put it. But the support in the community is there. We need a second airport early in the next century, we feel we are on schedule now and we feel it will be completed at the right time.

Mr. **Jones**. I thank you. And I thank you, Mr. Chairman.

Mr. **Lewis**. No other questions, Mr. Chairman.

The **Chairman**. I think that is it. Thank you very much.

Our third panel today represents surface transportation and road issues. We have Mr. Philip Boyd, Chief of Transportation Planning of the Atlanta Regional Council and Dr. Catherine Ross, Professor of Transportation at Georgia Tech.

If I could, before we begin this panel, let me remind all of our witnesses that because so many of you have offered to help us by appearing before us today, that while your prepared statements will be made a part of the record, I must ask that your oral presentations be kept down to 2 or 3 minutes, if you can, and this will allow us time to ask more questions and to have more witnesses.

TESTIMONY OF DR. CATHERINE ROSS, PROFESSOR OF TRANSPORTATION, GEORGIA INSTITUTE OF TECHNOLOGY; AND PHILIP BOYD, CHIEF OF TRANSPORTATION PLANNING, ATLANTA REGIONAL COUNCIL

Dr. **Ross**. I will certainly try to respect that. Let me extend a welcome to you, Chairman Anderson, to Congressman Lewis and Jones and to the members of the House Committee on Public Works and Transportation.

I am Catherine Ross, a Professor at the Georgia Institute of Technology here in Atlanta, and I want you to know that we were initially quite excited by this visit and wanted to somehow impress you upon your arrival and thought very seriously about having your plane circle the airport any number of times as we frequently do when we come back to Atlanta, but decided such was not an appropriate welcome to our city for such a distinguished body as yourself. On a more serious note, we are indeed quite pleased to have you here.

I have prepared written testimony and as such will just give a brief overview of my comments.

We are of course now everywhere confronted with the reality that our infrastructure has suffered from a lack of attention. There are a number of reasons; inadequate maintenance, poor management and insufficient budgeting for recapitalization of the infrastructure. I would suggest, however, that the issue is not only one of recapitalization but the integration of cutting edge technology and new capital investments.

Much attention recently has focused on the whole concept of smart technology, smart streets, smart systems. I suggest we ought to be driven by smart reinvestment in the transportation infrastructure. This must be done, of course, being cognizant of a supportive posture relative to economic development and obviously in the quality of life—improvements in the quality of life.

If I point now to needs in the City of Atlanta, the economic viability of the City of Atlanta, coupled with the age of the traffic signalization technology has really joined forces to impact negatively the mobility or travel within the city limits. As a result, we now find that we are compelled to upgrade our traffic control system for the City of Atlanta. We have done a great deal of work in that regard and have concluded that the implementation of a new traffic control system will take approximately ten years at a cost of approximately $40 million. Of course we can design this system with an open architecture that makes it amenable to accepting new technologies such as freeway incident management perhaps.

Bridges and viaducts need immediate attention in the City of Atlanta total approximately $29 million and our areawide capital improvements program for the year 1990 through identifies a need for three-fourth billion dollars worth of projects at regionally significant airports in the Atlanta area. This does not include, of course, a second airport about which we have just had some discussion.

The continued construction of MARTA is vital to the Fifth Congressional District and to the Atlanta region. The total cost of rail construction in the transportation improvement program is one-half billion dollars. The total cost of MARTA including rail construction and the transit operations program for fiscal years 1991 through 1998 is three-quarters of a billion dollars. We urge you, however, to continue to support the development of mass transit and would suggest that in fact that is a solution for many other places in the United States.

I think I will stop there except to say that I would like to go on the record as saying that the resolution of our infrastructure problems, it seems to me, suggests great initiative and effort on the part of both the public and the private sector. So at the same time that we are considering these needs, we have to do it from the perspective of leveraging investments by the public sector to attract interest and support and financial activity on the part of the private sector.

Thank you for this opportunity to testify and I do have a number of reports I would request be placed on the record, or at least have you review.

The CHAIRMAN. Yes, thank you. Without objection, your extra paper will be made a part of the record.

Mr. Boyd, would you like to make your statement now?

[The prepared statement of Dr. Ross appears on p. 1211.]

Mr. BOYD. Yes, sir. Thank you, Mr. Chairman.

The CHAIRMAN. You are Chief of Transportation, are you not?

Mr. BOYD. Yes, sir, Chief of Transportation Planning, Atlanta Regional Commission.

Let me just say I noticed on the program that our Executive Director Harry West was listed, and Harry regrets that he had another commitment this morning and I am standing in for him.

As Commissioner Lomax mentioned earlier, the water supply issue is probably the most pressing and critical infrastructure need in our region, and Mr. West is going to be talking to you this afternoon in your hearings about that issue.

We sincerely appreciate the invitation to appear before you today as you work to identify the infrastructure needs of the Atlanta region and our nation. I am submitting ARC's full testimony in written form to you, but would like to take a few minutes to summarize it.

ARC is the metropolitan planning organization for the eight-county Atlanta region and as such is responsible for maintaining the regional transportation planning process. In this capacity, ARC recently completed an update of the regional transportation plan out to the year of 2010. This plan includes a comprehensive package of highway and transit improvements which will cost us nearly $6 billion and will, overall, just maintain the level of service that currently exists in our region and on our local road network and with expansions to transit.

As we developed this plan, we identified several major transportation issues facing this region and we realized that these issues are not unique to Atlanta, but rather exemplify the new challenges facing the nation as a result of changed patterns of urban and suburban growth.

The first issue facing the region and the nation is how to provide new facilities to serve the mobility needs of suburban areas. In the Atlanta region, we have seen a tremendous increase in the number of vehicle trips bound from one suburb to another, yet few cross-regional facilities exist and those that do often have little or no capacity to spare. The situation is made worse by the lack of transit in suburban areas. The need to provide new and improved links between suburban population and employment centers is critical.

A second major issue confronting us is the need to maintain existing capacity provided by our radial freeway system. Suburban growth, coupled with inadequate cross-regional facilities, threatens to erode additional capacity as commuters use the radial and perimeter interstate system for cross-regional trips. Additionally, the growth of trips going into the region's core area or simply passing through the region is expected to increase markedly. We must strive to maintain the capacity and condition of these radial facilities.

A third major issue is transit. In the Atlanta region, we have recognized and documented thoroughly the need for transit in all the region's counties as a means to relieve highway congestion and provide mobility to those unable to use their own vehicles. We see transit as an essential element in a balanced and comprehensive transportation system. Neither the Atlanta region nor the nation as a whole can rely on highway improvements alone to meet all mobility needs.

A fourth issue we face exemplifies the changing nature of the nation's mobility needs in the 1980s and 1990s, what I refer to as the growth of suburban development centers. These activity centers have resulted in severe congestion as local traffic conflicts with through traffic. In addition, transit is often unavailable to provide any relief to the over-burdened road system. We must come up with new approaches to address these problems.

These are but a few of the major issues we see ahead as we move toward the 21st century. As we know from research and our own experience, the interstate highway system has played a key role in transforming the shape of American metropolitan areas over the past 30 years. Furthermore, it has been an essential element in supporting economic growth throughout the nation. As we approach the year 2000 we must maintain this system as well as address the new priorities and mobility needs.

There is a clear need for the federal government to play a strong role in this process in order to ensure the nation's continued economic vitality.

Atlanta, like the nation as a whole, depends more and more on air transportation. We are moving forward, as previous testimony has borne out, with regional plans to identify the best possible site for the Atlanta region's second air carrier facility, and appreciate the federal government's continued support of our efforts. The region's and nation's need for additional commercial and general aviation capacity is critical and we encourage Congress to make the improvement and expansion of the nation's airport and air traffic system a cornerstone of any plan to address the nation's infrastructure needs.

ARC applauds and appreciates the Committee's efforts. We will continue to support your work in any way we can and look forward to working together to meet the future mobility needs of our region and our nation.

Thank you very much for this opportunity to share our views with the Committee.

[The prepared statement of Mr. Boyd appears on p. 1068.]

The Chairman. John, would you like to open it?

Mr. Lewis. Thank you, Mr. Chairman. I do not have any questions but I want to thank these witnesses for appearing before us today.

The Chairman. Well let me ask you both—there are those who criticize the addition of new transportation capacity in metropolitan areas, believing that this engenders new growth which renews the cycle of requiring additional capacity. Now how do you address this? Does growth create capacity needs or does capacity stimulate growth? It is really a chicken and the egg question, but I was just kind of wondering what your thoughts were on that issue and I notice you have a little bit of it here.

Dr. Ross. Well I think there are instances where you can argue either the chicken or the egg. What, it seems to me, is important, is that as we increase capacity, there is a direct correlation in terms of—we can predict in fact subsequent growth. So the issue then becomes how do we leverage that transportation to facilitate or control that growth in a way that is helpful.

If you look at transportation literature, what it suggests is that we have, by and large, looked at capacity questions and resolved those on the basis of what the economic development interests were. And I suggest that we have to—my own thinking is that we have to be a bit more constrained in that approach and really ask the hard questions. We construct transportation facilities because they support life and economic activity. We do not construct transportation facilities so that we can consume transportation. We want to minimize that.

It seems to me that we have not thought enough about that, done enough of the kind of evaluation that allows us to make better investment decision.

Mr. Lewis. Mr. Chairman, will you yield there for a moment?

The Chairman. Sure.

Mr. Lewis. Would you sort of place in some perspective for the Committee should we in the greater metropolitan Atlanta area and the State of Georgia and in the nation, with the current crisis in the Middle East, be losing our love affair with the automobile and put more emphasis on mass transit and rail, maybe using rail to hook up cities between Atlanta, Macon or Columbus, Savannah, or having MARTA to go down to Newnan rather than these superhighways where we may not have fuel. Could you speculate, just think out loud, as we move toward the 21st century?

Dr. Ross. Absolutely. We look at and you hear so much about the suburban crisis and in fact if you look at and are cognizant of the fact that the biggest travel demand now is between suburban areas, not suburban areas to the central business district, any longer. We have to ask ourselves whether we can afford to put in place the kind of infrastructure that we currently have, if you look at our interstate system, to meet that demand. I suggest not. In fact what we need to be talking about is obviously going to have to be some small improvement in terms of capacity, but basically we are talking about another way of meeting that demand. I do not believe we can capitalize infrastructure to be responsive in that regard and I am also not convinced that we should.

The other notion that strikes me is that even if you look at these burgeoning suburban areas and we ask of them as we are asking of Atlanta and major metropolitan areas, that they begin to think about funding their own transportation infrastructure to a greater extent—I would suggest that what they are going to fund is not at all like what we have done historically, that that will have some local resolution. So I would suggest that we in fact not think about or carry around in our heads the idea that we can afford to capitalize our highway infrastructure to the point that it can meet suburban travel needs as they are currently growing, that there must be a multi-modal approach, certainly transit, para-transit offer great opportunities in that regard.

Mr. BOYD. Let me also say that I think this region has, over the years, recognized that a balanced transportation system is the system that we need. We have recently completed a massive rebuilding of our freeway system and it is essential to the economic vitality of this region.

Our plan today contains a few new segments, but it is oriented toward maintaining the capacity of that freeway system, but the majority of the road improvements, as Commissioner Lomax mentioned earlier, are for widenings of existing arterials and collectors throughout the region. These two-lane roads that need to be four lanes are critical to moving traffic in and out and through the region.

Transit is an important component of our region's plan and over the last 15 years we have gotten over 30 miles of rapid rail transit in operation. We have 32 more miles currently in the plan and part of that is programmed. I think the bottom line is that we need a strong partner in the federal government to free up these trust funds—the highway trust fund, the highway account and the mass transit account, and the airport trust fund, to bring these monies back to the state and to the local area so that these plans can be realized.

Mr. LEWIS. Thank you, Mr. Chairman.

The CHAIRMAN. Last Friday, I, along with Congressman Lewis and Congressman Jones and 68 other members of the Congress, introduced a resolution designating next year, 1991, as Rebuild America Year, and calling on the President and the Congress to establish a national infrastructure program. Today's hearing is a part of the process of finding out local infrastructure issues and concerns and how they might be addressed in a local program. We have been holding hearings, as you know, we had two yesterday and two the day before. We have been in Texas and Ohio and Louisiana. We will not get every state, but we will try to get around pretty well, and I have noticed almost every one had different kinds of problems that we are going to have to work out. We are going to have to get them to work them out locally as much as they can, but I think that we nationally have to give the leadership to try to get a national program. And sometimes you just do not know what—and I mention that in your deepening of your channel down here that we were looking at when we flew in last night.

I know you have got areas down here that need the same thing. I represent the part of Los Angeles that has the Long Beach port and the Los Angeles port in it, and there have been good Congressmen before me and I assume they did a good job and I did not try to upset too much. But it so happened the Port of Los Angeles only had a 15-foot deep channel and I guess everybody thought that was good enough, nobody landed—small boats could land there, but big boats could not. Most big containers have to have at least 45 feet. I am told that in the old days if there was something that had to go to Los Angeles, they would take it up to Oakland—could take it—or take it down to San Diego and unload and then bring it in by truck.

I happened to be out there—and this is about 15-18 years ago now—I happened to be out there one day and somebody wanted me to see something and I think it was one of the labor guys who wanted me to see it, and we saw where one of the big ships that needed 45 feet of water to come in, they decided to unload it anyway, but they kept it out about 2.5 miles out in the deep water. Then they took a little boat out, about a fourth or fifth the size of the big one, and they were trying to take this great big container off the big ship out in the deep water and put it on the little ship. There were no derricks out there, there was nothing out there. They tried the little hoists from the ships trying to do it. And I went out on a small boat and looked at it and it looked crazy. I thought somebody was going to get killed doing this.

So I asked why and I went to the Army Corps of Engineers and they told me years ago they had told somebody they should deepen the channel but no one ever did because it would cost money. So I said well how much is it going to cost. They told me they thought it would cost about, I think it was $36 million or something. So I went around to local groups, mostly private concerns, but I got some public money in the Los Angeles area, to get the $36 million and made the steps to deepen it. And then I was told no, it is not $36 million, it is $64 million or $68 million, which I did not have. But I went to the Army Corps and we struggled around and I finally got most of the additional money I needed from the federal government, so the total cost was split between the local people there.

We deepened the channel to 45-50 feet and almost overnight ships started coming in that had never come in before and business started getting so good—we did not have any business before that. We then deepened some of the channels in Long Beach as well. New York-New Jersey was the number one port complex in the Nation, they were ahead of everybody. We were nowhere. And in a short time we became more competitive and it was just a few months ago now that we passed them and we are now the number one port complex in the country. In the last six years, as a result of what we have done, we have brought into the federal government I think over a billion dollars a year clear profit in customs for the last six or seven years. And they tell me in the next ten years it will be even two or three times that.

So sometimes when you do these kinds of things, it makes money for the local people who are doing the business. Another thing that happened at the same time, when we did that, all of a sudden there was a movement for industries that wanted to come in and we had no place for them. So we built a world trade center. And we first thought: Well can we afford one, and we figured 10 to 11 stories originally, but before we even got the building started, it was totally rented out and there was another bunch of people that wanted to get in, so we added four or five more stories on the plans and the next was four or five more and it was up to 18, 19, 20 and when we finally built it, it is either 29 or 30 stories. The building is almost finished now except we now know we are going to need another building because it is already full and we have another big list of people that want to get in to do business. We are building a second world trade center I guess across the street in the next block.

The minute we got all the ships coming in, then we had to bring access for the trucks. We had a highway but there was not enough room. So we built a better freeway. But with all the business, then everybody started using the highway and so just a few weeks ago, I had seven of the big companies say you have got to correct this. It used to take us an hour to get into Los Angeles to unload this stuff and put it on trains or whatever and now it takes us 2½ to 3 hours with all the congestion. They also mentioned that they pay their truck drivers $25 an hour or something and if you pay a guy $25 an hour to go on a trip that normally takes an hour, but now it takes two and a half to three hours, you have got to add the cost to the products you are trying to sell, and that is why they cannot compete with what is going on in other countries.

It so happened we opened up a rail line that we hope is going to get the people off that highway into trains. I think we have got to take a look at this nationwide and come up with some answers to highways and bridges and water and everything else.

Mr. Lewis. Thank you, Mr. Chairman. We only have the Chattahoochee here and it is really hard to get big ships through the Chattahoochee.

The Chairman. That must have been the ones I had the hearings on yesterday that had the deep channel.

Would you like to comment?

Dr. Ross. I have one response. I worry a great deal—to take your analogy, a good, comprehensive transportation planner would have looked at, I think, the strategy where you could move certain sizes or commodities via the little ferry to make sure we use that to the maximum extent possible and then set aside those kinds of commodities or containerizations that could only be used for 45-foot deep channels.

I think sometimes we do not think about that sort of a short-range strategy. We are always attracted to the glamorous and the expensive and sometimes I think to our detriment.

The Chairman. I think it is very good when I find a professor of transportation at Georgia Tech—you know, I do not remember any professors of transportation when I was going to school, but it is good we have got one.

Dr. Ross. Me too.

The Chairman. Any other comments?

[No response.]

The Chairman. If not, thank you very, very much.

We have a fourth panel—I am told we are going to try and follow a schedule where we will finish up this panel about 11:30 and the DBE panel by 11:50 and our water needs panel by 12:10.

Our next panel is composed of Mr. Ken Gregor, General Manager for Metro Atlanta Rapid Transit Authority; Mr. Robert Remar representing a citizens group called CAUTION; Mr. John Martin, Esquire of the National Railroad Passengers Association and Mr. Sam Massell, President of the Buckhead Coalition. We have all four of you, so we can start in that order, if you wish.

TESTIMONY OF KEN GREGOR, GENERAL MANAGER, METRO ATLANTA RAPID TRANSIT AUTHORITY; ROBERT B. REMAR, CITIZENS GROUP, CAUTION; JOHN R. MARTIN, NATIONAL RAILROAD PASSENGERS; AND SAM MASSELL, PRESIDENT, BUCKHEAD COALITION

Mr. **Gregor**. Thank you, Mr. Chairman.

First of all, let me identify who I am, I am General Manager of MARTA. MARTA, of course, is an agency that you are familiar with and certainly our two Congressmen are familiar with.

Basically what I want to do today is simply address a couple of our major concerns. First, I want to point out that the continued federal partnership is essential to mass transportation. There is no question that the MARTA system which now provides 30 million bus miles and has 30 miles of rail and 29 stations, could not have been approved and operated without a strong federal partnership and commitment to this metropolitan area.

Dr. Ross and Phil Boyd identified some of our transit needs. What I would like to address is our concern dealing with the reauthorization act.

A level playing field was established through the Surface Transportation Act of 1982, which established the federal government's role in the area of public transit. That Act basically did two things to establish the level playing field. First, it provided one cent of the federal motor fuel tax to be dedicated to transit and thereby ended the vastly unequal competition for funds between transit and highways.

Second, it established the Section 3 discretionary funds to be apportioned on a 40/40/10/10 percentage basis. Forty percent going to meet the needs of the eight older cities for rail mod, 40 percent to the new start cities and ten percent to bus systems and ten percent for discretionary allocation. This level playing field has worked well for MARTA and the Atlanta region's transit needs. While some minor adjustments in this reauthorization may prove necessary, major changes I would hope should be made sparingly.

I appreciate the opportunity of pointing out these two items to you—the continued federal role and the reauthorization process, and thank you for being permitted to attend this morning.

The **Chairman**. Next on my list is Robert Remar.

[The prepared statement of Mr. Gregor appears on p. 1094.]

Mr. **Remar**. Thank you, Mr. Chairman, Congressman Lewis, I am here on behalf of CAUTION, which is a non-profit community based organization composed of neighborhood associations here in Atlanta. I would imagine that many times you have group coming before your committee asking for Federal aid. My group is coming here asking for federal aid not to be used to construct a limited access highway known locally as the Presidential Parkway.

Presidential Parkway is a highway of 2.2 miles that would go from downtown Atlanta to the city limits in De Kalb County, which would disrupt seven historic districts here in this district and would damage four city-owned parks including two of national historic significance.

With the Committee's permission, we have a videotape that we would like to show you, which shows the devastating effect on local communities of unneeded highway projects, specifically in the Inman Park Community. And here is the videotape right now, Mr. Chairman.

[Whereupon, the videotape was shown.]

Mr. **Remar**. Mr. Chairman, there is more of the tape, but in the interest of time, I think that sets out what the problem is. This land, which is 219 acres of now-vacant right-of-way is being held hostage on a federal aid project that the community does not want, the City of Atlanta opposes, De Kalb County opposes, all the neighborhoods oppose. It is not needed and we would suggest that these limited federal resources be used for other important infrastructure needs in the Atlanta area.

Thank you, Mr. Chairman.

The **Chairman**. Do we have a copy of that tape?

Mr. **Lewis**. No. Could a copy of that videotape be submitted for the record?

Mr. **Remar**. Yes, sir, we can make a copy.

The **Chairman**. It will be made part of the record, yes.

Mr. **Lewis**. Thank you, Mr. Chairman.

The **Chairman**. Mr. Martin.

[The prepared statement of Mr. Remar appears on p. 1178.]

Mr. **Martin**. Mr. Chairman, I am John Martin. Thank you for this opportunity to join you and Congressman Lewis and Congressman Jones. I represent the National Association of Railroad Passengers, which is a non-profit, consumer-oriented organization which for 23 years has been promoting balanced transportation.

Our Association's primary goals are improvement and expansion of rail passenger service of all types, increased support for mass transit in general and equitable treatment of freight railroads versus their competitors. When I talk about equitable treatment, I am talking about, among other things, trucks and water carriers that should be required to pay 100 percent of their infrastructure costs, as do the railroads currently.

As a nation, we continue to ignore and to place at a great competitive disadvantage, one of our marvelous resources—that being our railroads. And I think we now need to focus on the need to tap that resource, to put it on a level playing field and to take advantage of the benefits that it can give us.

The Iraqi invasion of Kuwait focuses on this very much. It points out again that we are relying on almost 50 percent of our oil from foreign sources. We are thus using oil which we are dependent on others for its access. The Oak Ridge National Laboratory has indicated that air lines use almost twice as much energy per passenger mile as the railroads. They have also indicated that trucks use over four times as much energy per freight ton mile as do the railroads. And I think those figures in themselves show the need for placing greater emphasis on the railroads.

We are not suggesting that we force Americans out of their cars. We are suggesting simply that public policy incentives to overuse of the automobile be revisited and be adjusted so that the other modes can be used to a greater extent. Americans have demonstrated very convincingly that they will use rail transportation and mass transit if it is made available to them.

Now how do we accomplish this? Clearly we need changes in policy because too many transportation decisions today are mode-specific. They are not made on the basis of what is best for transportation needs, they are made on the basis of who has the money or who can get the money. State and local transportation investments are heavily influenced by the availability of federal funds. As one state rail official told our executive director, the first question they ask when I go to the state capitol is "how many federal dollars will your project get us". So far, the answer for most railroad projects is "none". The policy needs to be changed to make funding available on a transportation basis, not on a mode-specific basis. If we had those changes, Atlanta would benefit greatly.

The initiation of a Chicago-Atlanta-Florida rail passenger service, something that is being supported very actively by the Atlanta Chamber of Commerce and by our members would be enhanced, the opportunity for that service would be made much more realistic and I think the service would start much sooner. Lack of federal funding may be a key reason why nothing so far has come of Georgia Rail Passenger Authority Act and if Atlanta gets the 1996 Olympics, a lot of the water events will be conducted in the Savannah area. We have no rail transportation system between Atlanta and Savannah today to move passengers and that would be a severe embarrassment, not only to the City of Atlanta, but to the State of Georgia as well.

Looking at mass transit, a sophisticated center such as Atlanta needs a diverse selection of options to be operated by MARTA. MARTA's single-technology heavy rail system cannot do the job alone. Some Atlanta bus corridors and some potential corridors that are developing in this area would be much better served by light rail which would combine the strong image shared by all rail transit with the ability of the bus. Commuter rail should be offered to the residents of this area using existing rail lines.

Mr. Chairman, as you know, a growing number of Americans have realized that more roads and more lane miles are not the answer. In Los Angeles where they have built more roads than any other metro area in the world, we probably have what is the world's worst transportation system. The brightest hope in Los Angeles is the recreation of a rail transit system that was destroyed nearly three decades ago, and as you know, Mr. Chairman, Californians and Los Angeles citizens voted this summer to tax themselves to support more inter-city rail and more mass transit projects.

Thank you for this opportunity to present our views.

The CHAIRMAN. Mr. Massell.

[The prepared statement of Mr. Martin appears on p. 1153.]

Mr. MASSELL. Mr. Chairman and members of the Committee, I am Sam Massell, I am President of the Buckhead Coalition and former Mayor of the City of Atlanta. I appreciate the invitation to appear and testify before you.

The Buckhead Coalition is a non-profit organization composed of chief executive officers of major firms in the north Atlanta community of Buckhead. Our mission is to foster orderly growth of Buckhead as well as to protect and enhance its quality of life. We believe that access to and through this area and the mobility of our citizens is of utmost importance. Our organization is presently working with the Metropolitan Atlanta Rapid Transit Authority, MARTA, of which I serve as a Board Member, to coordinate the development of the new Buckhead station. We also intend to undertake a feasibility study for constructing a monorail people mover system linking the Buckhead and Lenox MARTA stations with major employment, retail and hotel facilities within Buckhead, about which I wish to talk with you today. In addition, our organization is in the initial stage of organizing for preparation of a long range (20-year) plan for the full 28 square mile Buckhead area, which will incorporate these transportation issues.

Buckhead has been identified as a suburban downtown. In addition to the 58,000 residents in this community, we have 70,000 jobs and an estimated day time population of 115,000 people. In the past decade, Buckhead has accounted for 40 percent of all new jobs and 70-percent of all population and housing growth within the City of Atlanta.

Presently, the commercial area of Buckhead contains approximately nine million square feet of offices; four million square feet, about 1,000 units of retail and 4,000 hotel rooms. Well over half of all commercial and office development in Buckhead is less than ten years old. Land assemblages and multi-use developments already zoned suggest an additional ten million square feet of offices, an additional one million square feet of retail, an additional 1,800 hotel rooms and 2,000 apartment and condominium units over the next decade.

We recognize the absolute necessity of an adequate infrastructure improvement program for the continued growth and livability of expanding urban areas such as Buckhead, and this morning we would like to relate one of these needs and make a specific request for assistance.

Transportation is a basic infrastructure of course, usually but not always provided by government. In the case of Buckhead, transportation includes both roadways for automobiles, buses and trucks; traditional rail for AMTRAK and rapid rail for MARTA. At this time, construction is underway on the extension of Georgia 400, a limited access state highway and the MARTA rapid rail north line. In all likelihood, this will be the last new arterial road constructed in Buckhead for the foreseeable future. While this road will relieve substantial traffic on existing neighborhood surface streets, it serves primarily to bring people into the business center. The major future need then will consist of integrating transportation modes and providing internal circulation within the Buckhead high-density area.

We believe that a monorail people mover has the most potential to both improve internal circulation and to integrate transportation modes within Buckhead. The downtown core of Buckhead is rapidly achieving urban densities within a wide array of land uses, including office, retail hotel and multifamily residential development. The density and quantity of development, combined with the ability to integrate auto, bus and rapid rail transit modes gives Buckhead the ability to serve as a national demonstration project, illustrating the use of mass transit technology to achieve suburban mobility and to showcase both a private initiative and a public-private partnership.

In view of the transportation needs and opportunities within the Buckhead commercial core area, we hereby respectfully request that this area be considered for a demonstration project. This would consist of a transportation study which would address the following issues: Project patronage of a monorail people mover, conduct both concept and preliminary engineering studies, develop a preliminary route and determine right-of-way needs, develop a phasing plan and cost estimates for each phase, develop a financial plan for payment of both construction and operational costs, and develop a consensus among the affected parties for an adequate formula to support the system financially.

We anticipate that a major portion of the construction and maintenance will be borne by owners of commercial property within the people mover corridor. The State enabling legislation for a self-imposed special tax district is in place, and our preliminary estimates suggest that financing could be achieved with a reasonable office and commercial rental increase of approximately 50 to 60 cents per square foot per year.

We have reviewed our proposal with the Atlanta Chamber of Commerce and MARTA with supportive responses from both, and we are pleased to announce the co-sponsorship of this undertaking by the Atlanta Regional Commission, the legally designated transportation planning agency for the Atlanta region.

We estimate the costs of the study to be approximately $150,000 to $175,000 I believe that the study can be completed in approximately 10 to 12 months. We hereby request respectfully that the Committee on Public Works and Transportation request funding for this specific study, preferably from funds appropriated in the current fiscal year, 1990.

We thank you for this opportunity to address the Committee and will be pleased to provide any additional information you may desire.

The CHAIRMAN. Thank you, gentlemen.

[The prepared statement of Mr. Massell appears on p. 1158.]

The CHAIRMAN. I do not have a question, but I have a comment. Mr. Remar, let me say that in John Lewis, you have a strong opponent of the Parkway. Ben Jones is also opposing the Parkway, and this morning I had an opportunity to meet with a number of local residents opposed to the project. So there is no question that your views and those of CAUTION are well represented and articulated in Washington.

Is there anything more that either of you would like to comment on?

Mr. LEWIS. Thank you, Mr. Chairman.

Mr. Remar, let me just ask you one question. What is the projected cost of the proposed Presidential Parkway. When I sat on the City Council it was a certain amount and I am sure the cost probably has escalated some during the past few years. Can you tell members of the Committee and the Chairman particularly what is the projected cost?

Mr. REMAR. Congressman Lewis, the construction costs are between $34 and $40 million. The right-of-way—the value of the right-of-way that would be used is between $16 and $18.5 million. And in addition, the downtown connector stub, which I believe you saw, had to be reconstructed at a cost of approximately $48 million. So that the cost of this 2.2 mile limited access highway is somewhere between $58 and $80 million. We estimate about $36.5 million a mile. So it is an extraordinarily expensive road and one that I must say that even when it was proposed had a very marginal traffic need. Traffic volumes are down, we do have the MARTA east rail line and with I think surface improvements in the area, signalization improvements and intersection improvements, the traffic needs of this area can very well be met without it.

Mr. Lewis. Thank you.

Thank you, Mr. Chairman. I yield back my time.

The Chairman. Congressman Jones.

Mr. Jones. Thank you, Mr. Chairman.

I too would like to make a few comments. This has been a very diverse panel but it all makes a lot of sense when you start looking at the big picture. Once again, talking about preaching to the choir, I go on and on about rail travel and everybody who knows me knows that I am a rail advocate and in MARTA there is no finer system in the country, and we need to continue to do all we can to expand and enhance MARTA's effort.

Mr. Martin, I could not agree with you more, and I think we need—whenever we talk about any kind of comprehensive planning for our transportation needs in this region, we need to talk about commuter rail, we need to start talking about mag-lev technology, we need to start talking about the expansion of other AMTRAK routes, and to make that our cause. Because without it, we are simply not going to continue to grow. With Mayor Massell coming in with—I think the federal government ought to be able to come up with $175,000 frankly, Mr. Mayor. You have certainly got an advocate in me for that project and I am sure in Congressman Lewis also, Mr. Chairman.

But when we start talking now about inter-modal and how all this connects up, and I appreciate Mr. Remar being here because one thing that is often forgotten in this I think is not just moving people around, but the quality of life of the people in our neighborhoods. And we have to have their input and we have to be responsive to that as we continue to grow because after all we are simply a city of people. This is a city with great neighborhoods, and I think as we face these problems comprehensively that is perhaps the most important part of the mix.

So I just want to thank all the panelists for bringing—giving up their time and coming here and I very much appreciate it.

Thank you, Mr. Chairman.

The Chairman. That is why we do these hearings, so we can get views from people out there and know what we should and should not be doing. So thank you very much.

Our next panel, our fifth panel I believe, represents disadvantaged business enterprises. Mr. Brad Hubbert, Fifth District Representative from the Georgia Department of Transportation; Mr. Pelham Williams, President of Williams, Russell and Johnson; Mr. Hal Rives, Commissioner of DOT and E.R. Mitchell, Jr. of the E.R. Mitchell Construction Company.

We put your name down, you sit by it and we will know who is not here. Mr. Rives, Mr. Hubbert and Mr. Mitchell. I guess the one that I called that is not there is Mr. Pelham Williams, the President of Williams, Russell and Johnson—he is the one missing. So we have Brad Hubbert, Hal Rives and E.R. Mitchell, Jr. Do you want to start your testimony off in that order, or do you what to do it differently?

Mr. HUBBERT. I will yield to the Commissioner.

TESTIMONY OF HAL RIVES, COMMISSIONER OF GEORGIA DEPARTMENT OF TRANSPORTATION; BRAD HUBBERT, FIFTH DISTRICT REPRESENTATIVE FROM DEPARTMENT OF TRANSPORTATION BOARD; AND E.R. MITCHELL, Jr., E.R. MITCHELL CONSTRUCTION CO.

Mr. RIVES. Thank you, Mr. Chairman.

If I could have your indulgence for one moment—I am here to talk about DBE but since a project that is very near and dear to my heart and is awfully important to the Atlanta region, is part of the Atlanta Regional Commission transportation plan for the Atlanta region, part of the transportation improvement program, has been brought up, I ask your indulgence, after I finish with DBE, to make a few comments on it and also to submit something for the record on the Presidential Parkway.

With respect to DBE—Mr. Chairman, members of the Committee, welcome to Georgia. It is an honor and real pleasure for me to appear before you to talk about transportation issues. But I am going to limit it just to DBE.

Let me speak about the DBE program. The Department presently has some 235 firms certified as disadvantaged business enterprises. Of that number, 177 are contractors, four are consulting engineering firms and 18 are suppliers.

The Department also has some 98 firms certified as women's business enterprises, WBE. This consists of 75 contractors, seven engineering consultants and 16 suppliers.

Since 1975, the Department has been committed to minority and female business participation in its construction programs. The present DBE goal, disadvantaged business enterprise, is 10 percent participation on federally funded construction work. In 1988, our overall DBE percentage was 10.9. It was 10.75 percent in 1989 and is projected to be 11.2 percent in the current year.

Although the Department is pleased with the achievements that have been made in the disadvantaged business enterprise program, we have experienced and noticed an alarming trend in recent years and this trend is not just in Georgia, it is in the whole bank of the southern states and probably nationwide also. This trend was caused by in the 1986 Act the merging of the MBE, minority business enterprise programs, and the WBE, the women's business enterprise programs, into one program called the disadvantaged business enterprise program. In this State, which has a large black population, this trend I am going to describe to you is alarming and we feel that remedial action is called for.

The trend is that the volume of contracting and subcontracting by minority business enterprise firms is decreasing while it is increasing for the women business enterprise firms. To illustrate this point, after goals were combined in the 1986 reauthorization act, in 1988, minority business enterprises received 8.8 percent of the total work and 3.4 percent went to WBEs. In 1989, 6.2 percent went to MBEs and 4 percent to WBEs. To date in 1990, 5.7 percent has gone to minorities and 6.3 percent has gone to the female firms.

As you can see, this trend continues and we strongly urge that in the new reauthorization act, that the goals for the two categories, minority business enterprise, and women's business enterprises, be once again separated and separate goals set for each one, so that we can continue with what was a reasonable and yet increasing program of black firms involvement in our federal aid programs. We think it is essential that we do that.

I was going to talk about such things as urban congestion, but my written testimony that I filed will do that, and to solve those problems, I recommend to you the AASHTO program that has been submitted to you, Mr. Chairman, for the reauthorization act.

Now if I may take just a moment to mention the Presidential Parkway. The estimate given by Mr. Remar of $80 million has about as much sense to it as most of their other arguments. It will cost $25 million. The right-of-way is already in hand. I did not hear anyone mention the fact that this has been fully litigated within the federal court system, all the way through the 11th Circuit Court of Appeals. It was also appealed by the plaintiffs to the U.S. Supreme Court and the U.S. Supreme Court refused to hear it. The 11th Circuit Court found a lot of things, but they found primarily the three most important things. After testimony by all witnesses who were examined by counsel, cross examined by the other counsel, so that—in an adversarial hearing where each party was represented by competent, capable, and very enthusiastic counsel—after hearing all that, the district court and the 11th circuit court of appeals found three things.

First, the project is needed. It is a regional project, it is included in the regional transportation plan produced by the Atlanta Regional Commission. They concluded it is needed.

Second, they concluded there is no way to satisfy that need without the use of historic lands and park lands. That conclusion had to be made in order to get by those problems.

Third, they also concluded that of the alternate studies, the one that was selected is the one that does the least damage to the park lands and to the historic properties.

I do not think that I have ever in my long years of being involved in federal legislation—I have seen lots of projects named to be built, to be constructed, in the legislation. I have never seen a project named not to be built. And we would hope that would not be the case with this.

I would like to submit to you a more full statement on this issue since it came up as a surprise to me, for the record.

The **Chairman**. Without objection that statement will be made part of the record.

Mr. **Rives**. Thank you, sir. That concludes my statement.

The **Chairman**. Mr. Hubbert.

[The prepared statement of Mr. Rives appears on p. 1196.]

Mr. **Hubbert**. Yes, sir.

Mr. Chairman, Congressman Lewis, Congressman Jones, Committee members, I am indeed delighted to have such an opportunity to testify on issues that have such a tremendous challenge. I am also a little disappointed that we have so little time to share so much information, information that could set policies for many years and even decades, which could affect so many lives.

I initially had two topics I had planned to discuss; one was on the infrastructure of the city, but in lieu of the time, I will spend most of my time discussing the second topic, which is DBE-MBE program.

This program has a special interest to me. The program I feel is first titled incorrectly. It probably should be titled the National Enhancement or Improvement to Equal Access to economic opportunity for all American citizens. That probably would be more applicable to the title—as a title for the DBE program. The reason I say that is because the benefactors of that program will be the American people in total, not just the MBE person or DBE or WBE.

Our federal government has considered closing down SBAs which is a program determined to help MBEs and WBEs. There has been discussion about not needing the DBE program, MBE program, WBE program because it is not serving its purpose or because there has been some abuse in the program. In most programs there are abuse. But we have yet to come close to reaching $500 billion abuse that has plagued the S&L program that we have and no one has mentioned closing down the S&Ls, no one has mentioned not bailing out the S&Ls, a program that served a lot of folks, but I think there are a lot more that are being served by the MBE, WBE programs also and I think it is a program that is worthwhile, that is truly needed.

In discussing the DBE-WBE program, there are several points I would like to raise and I guess, number one, is the justification of the program, do we need a program. And my answer to that is yes.

The second one is the structure of the program.

The third is the process criteria for qualification and certification for participation in the program.

The fourth is evaluation and monitoring of the program.

Fifth is the policy of establishing administrative incentive and sixth, penalties for misuse and abuse of both funds and programs.

Justification of the program—this is a much needed and very worthwhile program. If there is truly a sincere commitment to the program's success, the commitment is demonstrated in several ways. The appropriation of substantial and adequate financial resources, the structure of the program which gives complete identification of what is needed and how it should be laid out. And to echo what Commissioner Rives has said, the program definitely needs to be separated. There needs to be a DBE portion of the program, an MBE portion of the program and a WBE portion of the program. I am of the opinion that such a program is critically important and that little or no action on it would lead to physical confrontation in the future. Some place very deep in our country's Constitution is a statement that all citizens should have a right to life, liberty and the pursuit of happiness. And this clearly means that we have to have access to the economic opportunity to pursue those rights, life, liberty and the pursuit of happiness.

It is imperative that our leaders realize that a serious effort must be made to narrow the gap between the haves and the have-nots desiring to work with integrity in a just economic system. In my discussions with various entities in the construction industry, frequently the statement is made that if there was not a federal DBE program, we would not be using any MBE firms. And I believe this statement is a true reflection of the genuine sentiment that propose to omit the tremendous capabilities radiant in the minority community.

If you take a look at all of Georgia's state highway construction projects where there are no federal dollars being used, where there are no federal goals, and in the absence of a mandated goal, rather than establishing some kind of objectives for trying to achieve some parity as far as participation, in 98 percent of the goals, the projects that are done with state funds, there is less than two percent of minority participation in those goals. We need to address that issue, something should be done there also.

Something is seriously wrong with our national priorities when we can spend billions and billions of dollars and allocate some of the best minds to the space program, and still have major mistakes such as that of the Hubbell telescope, and yet cannot spend one billion on 30 percent or 40 percent of our population to make sure that they have equal access to economic opportunity in this country.

We are not talking about affirmative action, we are talking about equal access to the economic opportunities of this country. I am of the opinion that a soundly funded and administered DBE program would greatly enhance the size of our tax digest and significantly reduce our tax burden. More importantly, it would give each participating DBE a sense of meaningful participation in our nation's economy—and this is a powerful message. DBEs in Georgia share the desire with people around the world, whether East Berlin or Czechoslovakia. Recently major shifts in governments throughout the world have shown us that the average citizen wants to be governed under a democratic process—which means a government run for the people and by the people.

The global challenge of the future, as I see it, will be to determine which countries will successfully introduce the most productive and balanced democratic participation for all of its citizens, minority and otherwise, which countries will have the largest number of citizens being truly productive, feeling that they are truly important, because they are making a significant contribution to our society.

The structure of the program I alluded to earlier is that it should be in three parts; an MBE portion which I feel should consist of about 12 percent, a WBE enterprise should be in the neighborhood of eight percent and a disadvantaged business enterprise goal should be set at five percent.

Under each section there should be strict guidelines for qualifying. There also should be consistent interpretations of what constitutes a person being eligible for these classifications.

There should be a well-defined bond assistance program in place to help those persons in the DBE program who are successful contract awardees.

Operating capital. There should be a well designed program to provide short term loans and lines of credit for those persons.

Minority contractors, for the most part, cannot find or do not have access to sufficient operating capital. Furthermore, if they are successful in finding capital, it is frequently so expensive that interest costs consume all profits by the end of the contract.

In addition, most of these contractors are in a sub-contracting position or even a sub-sub-contracting arrangement which prevents most lending institutions from extending credit on the contract.

In many cases, the prime contractor will hold the sub-contractor's money even after the prime has been paid and after the subcontractor has successfully completed the contract.

Therefore, if we are serious about a program, we need a program that includes all components necessary to address and remedy the above concerns. A healthy functioning business is similar to a human being. It consists of three major components—the inspired and thinking brain, the working and productive physical body and the spiritual soul. In business, we need the inspiration and motivation provided by a dynamic access to economic opportunities (similar to the brain), the access to capital which provides the wherewithal to be productive (similar to the body), and the access to bonding which guarantees integrity (similar to the soul).

In the past, we have been supplied piecemeal with these various components with one or more frequently missing or poorly developed. We must commit to making the program robust and healthy by providing all of these at the same time.

The process and criteria for qualification and certification—there should be very definite and specific guidelines for participation in the program. These guidelines should follow the definitions of MBE, WBE and DBE before being certified with DOT.

A company should be in business for a minimum of one year, preferably longer.

A company should perform a minimum of $50,000 of construction in a related field.

There should be day-to-day operations by the head of the company who must demonstrate genuine and meaningful participation on a day-to-day basis. The person must be evaluated on a day-to-day basis that they must have a thorough working knowledge of the entire operation. They must be involved in the day-to-day decision-making process. Their participation cannot be limited to being listed as owners on stock certificates and as a signatory on a bank account.

These standards serve a specific purpose—they eliminate the practice of establishing front companies overnight after contracts are awarded and before contracts commence.

You have the rest of my written testimony which goes on to deal with the evaluation. There should be personal reviews and we need funds and commitment to make sure that takes place. And in my summary—I will go on with the summary since time is of the essence, but I think our focus is on helping MBEs and I do not think that should necessarily be the focus. There are many other reasons that are much broader and more in depth than just helping the MBE, WBE.

I think it would have a significant benefit to the country, such as well it will reduce the number of persons in the unemployment line, will reduce the number of persons on welfare, will reduce the number of persons that probably are incarcerated, will reduce the number of problems that we are having with crime and we will truly redistribute the tax burden. A program which delivers all these benefits is truly a program where every American citizen will be the benefactor. These are the reasons I feel that a DBE program is a must, not later but now.

Mr. Chairman, in closing, this is my second such committee hearing this year and I am reminded of a lone voice crying in the wilderness for help and the only sound that is heard is the echo of his call. We are hopeful that some serious action will be taken in consideration of the DBE-WBE program and that our voice is not an echo in the wilderness.

Thank you.

[The prepared statement of Mr. Hubbert appears on p. 1121.]

Mr. MITCHELL. Mr. Chairman, let me start off by saying that we in the State of Georgia are very proud of our very distinguished Congressman John Lewis, who is doing a fine job in service to our state.

My name is E.R. Mitchell, Jr., I am President of E.R. Mitchell Construction Company. I am also President of the National Association of Minority Contractors, Atlanta Chapter and also the Secretary at the national level.

In the interest of time, you have my testimony, I just want to make a few points here. I wanted to state formally that the NAMC, National Association of Minority Contractors, supports your goals and their continuance. There is a problem in our society because of the fact we need goals, and we need goals because we are shut out of the private sector—it is closed to minority firms.

In terms of employment and business discrimination, I think if you were to look at our industry, the construction industry, you would find it was widespread. In terms of business opportunity, the majority of general contractors tend not to seek out or employ minority sub-contractors on large—or small—non-government jobs that do not have goals on them. In terms of employment, I challenge you to walk right here in the streets of downtown Atlanta and look at any major project, any medium-sized project, any small project on which a majority contractor is doing work, and you will not find not one black superintendent, go into offices and I challenge you to find one black project manager in the City of Atlanta that is working for a major firm. And I do not think you would find any estimators. And that is the same with female individuals.

The CHAIRMAN. Could you speak a little bit louder?

Mr. MITCHELL. Is my mike on?

Is that better? Okay.

And also the public is always complaining, or some individuals in our country, our society, are complaining about goals for minority participation at the national and local levels. But these same individuals seem to accept the major set-asides for the—for companies such as Lockheed, such as McDonnell-Douglas, such as General Dynamics. And these are set-asides and not goals like with minority firms.

I echo Mr. Hubbert's concern and statement about enforcement of minority participation goals. We at the NAMC would like to see penalties involved and incentives. For example, an incentive can be for a GC that meets a certain goal, we can go to—the government can go to that individual and say we will pay you every two weeks as opposed to on a monthly basis, to help you and your sub-contractors.

We support S. 1235, a bill introduced by Senator Paul Simon, and the legislation introduced by Representative John Conyers, the Economic Equality Act of 1989, as well as other congressional efforts intending to reverse the negative impact of CROSON.

On bonding, minority contractors continue to be denied meaningful access to surety bonding, particularly in the corporate surety market. And this is a widespread problem. We would like to see some of these corporate sureties penalized for not having minority companies listed as one of their customers. They do not keep those records. We have asked for those records before regarding the percent of minority business you have, and they do not keep those numbers. They also do not have any standard criteria for turning companies down. It is all—if you go to a company and you ask for bonding, they can turn you down because they do not like your shoe size or you do not have $15 million in the bank, but when they go to the next individual, it is a different story. They can have $100,000 in the bank and the biggest feet that you have ever seen and they get bonding. There is no method to their madness, no criteria by which all applicants are judged.

We would also like to see the SBA double their bonding on any single one job. I think right now it is about $1.2 million. It would be nice, and it would help out not only minority companies but small business throughout the country if we could double that to about $2 million.

And last, we agree with Mr. Hubbert and Mr. Rives about the ten percent disadvantaged enterprise goal, it should be separated based on female companies and minority companies.

Thank you for your time.

[The prepared statement of Mr. Mitchell appears on p. 1162.]

The CHAIRMAN. Thank you very much.

At yesterday's hearing, I made the point that infrastructure is not just highways or just aviation or just water, it is all the systems working together as one. Likewise when we talk about who does our infrastructure work, we must find ways for active participation by disadvantaged business enterprises, by all.

Now you have touched generally on some of your concerns. However, if I would ask you to single out the one key issue of importance when it comes to DBEs and infrastructure—that is disadvantaged business enterprises—and infrastructure, what would that be?

Mr. MITCHELL. I would say that there are two—I am sorry, I apologize——

The CHAIRMAN. OK.

Mr. MITCHELL. One would be——

The CHAIRMAN. You can have two, that is all right, one or two.

Mr. MITCHELL. I would say that having goals in place and goal enforcement would be number one. And number two would be to help minorities rectify this bonding problem. There seems to be some type of conspiracy nationwide and we cannot go through conventional sources to obtain bonding and are not subjected to the same criteria as our fellow majority companies.

The **Chairman**. We had a bill-signing program at the Capitol, I guess a couple of weeks ago now, on the DBEs and there were several thousand people there and not one of them mentioned bonding. There were other things they mentioned, but—and of course the President signed the bill and we passed a bill that was pretty well approved by the disadvantaged community. They applauded when we passed the bill and they applauded when the President signed the bill. But then I went out and met with I guess at least two or three thousand and not one of them mentioned that issue, so I would like to have you kind of elaborate a little bit so I know what it is.

Mr. **Mitchell**. Yes, sir. Right now I think that there are a couple of bills that are being worked on by members of the House. One is the bill by Representative Cardiss Collins and that is a bill that would address the acceptance of individual sureties by the federal government. There is some question about whether or not those bonds—whether or not they will be accepted, and minority firms have had to resort to individual sureties which charge between three and five percent of the contract amount.

There is also another bill, I think that—I do not know where it is right now, but there is a bill somewhere in the Senate, I know that Senator Nunn was apprised of that bill, to provide some bonding for minority firms that was separate and apart from the SBA bonding program. This was an effort to get corporate sureties to participate in such an effort.

And lastly on the SBA front, there has been a continuing problem of corporate sureties to participate in this program. We see a lot of sub-standard companies and the corporate surety's sub-standard arm participating in this program, but since the bonds are guaranteed 80 to 90 percent, they are indemnified, we cannot understand or do not understand why they refuse to participate.

The **Chairman**. Mr. Hubbert, do you want to comment on that?

Mr. **Hubbert**. Yes, sir, Mr. Chairman.

Some of the problem as it relates to bonding is that in a lot of cases, most of your small DBE firms have not had the need for bonding, so that the project that they have been given has been below the level that a bond has been required. In other cases—in some cases the prime contractor will, if he has a good enough relationship with a particular DBE, he will underwrite the bond, so I would surmise that the group that was up there was just trying to make sure there was a goal first and probably will come back later and say "we have got the goal, now we have got the business, but we cannot perform because we cannot get a bond". That would be my input on that.

Mr. **Mitchell**. Just one quick comment for your information. The bill that is being worked on is a House Bill and it is the Surety Association Act of 1989, it is H.R. 4179, and based on our testimony before Representative Conyers' Committee, he was going to include some legislation—our understanding was he was going to include some legislation in his proposed bill also on the bonding issue.

The CHAIRMAN. Mr. Lewis.

Mr. LEWIS. Mr. Chairman, let me just thank members of this panel, Commissioner Rives, Mr. Hubbert and Mr. Mitchell for bringing to our attention in such a dramatic way the problems and issues concerning disadvantaged business enterprises. I know you as Chairman and other of our colleagues on the Committee when we get ready to reauthorize the legislation next year, will give this concern serious consideration.

I just want to thank these gentlemen, this panel, for bringing it to our attention.

The CHAIRMAN. Mr. Jones.

Mr. JONES. Mr. Chairman, I just want to echo Congressman Lewis' comments and thank the panel also. This is something that we have discussed in the past and I think it is still to be addressed and hopefully in the near future will be aggressively addressed.

Thank you.

Mr. LEWIS. I would like to ask the Commissioner one question for the record. Mr. Commissioner, as it relates to the Presidential Parkway, it is true that all of the political subdivisions, the main one being the City of Atlanta, the Mayor, members of the City Council, have opposed the construction of the Presidential Parkway as projected, as planned.

Mr. RIVES. I guess you would have to look at what time is involved in that. When Andrew Young was Mayor, we entered into a contract with the City of Atlanta, which was ratified by the City Council, to construct the Presidential Parkway and to construct the totality of the Mayor's plan which was a housing component and the Parkway component. So at that point in time, no, they were not against it.

Now at another point in time, they became against it. You know that was an issue that was litigated too. The Georgia Supreme Court said that they could not draw away from it because they had approved it and committed significant resources based upon that approval.

Mr. LEWIS. Thank you, Mr. Commissioner.

Thank you, Mr. Chairman.

Mr. MITCHELL. May I make one brief request? May I submit a resolution from the National Association of Minority Contractors into the formal record to you.

The CHAIRMAN. As far as I am concerned unless there is objection.

Mr. LEWIS. No objection.

The CHAIRMAN. So ordered, it will be included.

Any further comments. I missed you a moment ago, Mr. Rives, do you have anything you want to say?

Mr. RIVES. On DBE I would echo Mr. Mitchell. I think that after the goals—because we were meeting the goals with the black firms and we were beginning to exceed the goals when the 1986 act came along. I still think that is extremely important. The bonding is a serious problem.

Mr. HUBBERT. Mr. Chairman, there is no question—I want to be the third one to echo that also. The goals are important and the separation of the goals and bonding.

The CHAIRMAN. Thank you very much for bringing this out and I will ask these two gentlemen on each side of me to explain a little bit more and tell me the significance of it.

Our last panel today consists of representatives of issues surrounding water treatment and sanitation. Mr. Robert Gerber representing Atlanta Chamber of Commerce Task Force on Water Quality and Ms. Odessa Wheeler, Community Activist for the Community Flood Control of Proctor Creek.

We can start either way, Ms. Wheeler or Mr. Gerber. Ms. Wheeler, why do you not start? Ladies first.

TESTIMONY OF ODESSA POPE WHEELER, COMMUNITY ACTIVIST, COMMUNITY FLOOD CONTROL OF PROCTOR CREEK AND ROBERT E. GERBER, ATLANTA CHAMBER OF COMMERCE, TASK FORCE ON WATER QUALITY

Ms. WHEELER. Well since he had a long speech, I was going to let him go first.

Distinguished panel and friends present today, my name is Odessa Wheeler, I am a community activist. I live in the northwest area and a little bit about my life is attached to my presentation.

I would like to say that in this presentation, as you can see in my presentation, I think everybody in here that is connected with the City of Atlanta knows about Proctor Creek and if you have not read my presentation, I would like to just go over it with you briefly because I believe in making it short and to the point.

As I was stating, I have resided in the northwest community for the past 29 years. Proctor Creek has been and is the number one pressing problem confronting these communities, which are named above, which is communities consisting of both black and white residents. It has always been a mixed area for over 126 years and it is known as the northwest Browntown area, Scott Crossing, Riverside and Whittier Mill Village, Bankhead Highway and Bolton Road surroundings. We came into the city limits in 1952.

It has been the number one pressing problem confronting these communities. Each year before and after the development of community block grants for capital improvements, these communities have begged the City of Atlanta for treatment of the horrible odor and the overflowing of Proctor Creek, along the Hollywood Road bridge and residential backyard washout of the Clarissa Drive, N.W., located in the 221 housing units; 221 houses are those houses that were built for urban renewal by the City of Atlanta in 1961. Some days you must completely close all windows if you are allergic, or to eat.

After the loss of lives, two from one family (over three children), one was never recovered, the community still received no help. Proctor Creek and its territories cross state and county lines. We know Maddox Park on Bankhead Highway is the beginning somewhere near or on the boundary of Southern Railroad branching off at different places until it reaches the Chattahoochee River which enters the Mississippi and terminates at the Gulf of Mexico.

Flood plains, storm and sanitary sewers, streets, highways and bridges has not changed the characterization as it relates to a poor community after admission into the city limits in 1952.

Not only does the community suffer from a polluted creek, but more landfills per community in the City of Atlanta.

And I have respectfully submitted this to you.

To correct this problem, we have always been told that this would cost millions of dollars, and which they said that the city could not allocate this type of money. During the time that Senator Leroy Johnson was our Senator, he did do some type of excavation along Proctor Creek that did stop some of the overflowing in the homes. And if you will go along the Clarissa Drive area, you will see the homes are washed out and in a couple of years they will not have any backyard because it has almost completely destroyed it.

The industrial growth in our community continues to grow. The sewerage tax has not met the needs of the community. So we are asking if you could go back to Washington and see if something could be done about this problem.

Thank you.

The CHAIRMAN. Mr. Gerber.

[The prepared statement of Ms. Wheeler appears on p. 1249.]

Mr. GERBER. Mr. Chairman, Mr. Lewis, Mr. Jones, I wish to respect your time constraints and my remarks will in fact be brief. But if you would allow me to present to you my written comments, I would deeply appreciate that.

The CHAIRMAN. You and everyone, your written comments will be printed in their entirety.

Mr. GERBER. Thank you, sir.

I am Chairman of the Metropolitan Atlanta Chamber of Commerce Water Quality Task Force. And of course on behalf of the Atlanta Chamber of Commerce I wish to thank you, Mr. Lewis and Mr. Jones, for the invitation to testify before this Subcommittee.

Today I wish to address water quality issues related to the infrastructure needs of the Atlanta region. I am testifying as a concerned businessman and former county public works and planning director. I became involved with Chamber activities related to infrastructure improvement years ago, feeling that private sector cooperation, input and financial support is vital to an effective infrastructure system.

As the Chairman of the Water Quality Task Force, I oversaw the development of the Chamber's Long-Range Planning Development Program and Document. The report addresses many pertinent concerns related to water quality in the Atlanta region appropriate for support by the Atlanta business community.

Water quality and economic development are inextricably linked. And as you alluded to much earlier this morning, Mr. Chairman, the capacity to attract and sustain new jobs, new homes, safeguard the public health and enhance regional recreational resources are factors in the struggle to maintain an effective, equitable system of water quality, management and an attractive quality of life.

It is unquestionable that Atlanta and all of the jurisdictions adjacent to the Chattahoochee River must improve water quality in the river to secure an adequate water supply. Our downstream as well as all neighbors on the Chattahoochee have the right to expect a reasonable volume of clean water. Local, state and federal governments, business and civic interests must address and find solutions to improve water quality in our region.

The first item that I would like to just address briefly is nonpoint and wastewater treatment facilities, as they remain a potential source affecting water quality. Local jurisdictions in the entire metropolitan area may continue to experience temporary development and use moratoria over the next several years if growth exceeds plant construction schedules or if water supply standards are more restrictive. Many of the difficulties in meeting wastewater treatment capacity and quality arise from citizen opposition, growth pressures, changing water quality standards affecting the design, permitting and constructing lead time requirements, the service areas that are based primarily on political boundaries rather than natural drainage basins and of course adequate financing.

An additional water quality issue deserving aggressive attention is combined sewers. As you may know, over 1,700 cities in the United States are affected. Combined sewers are designed to carry both sewer water and storm water run-off in the same pipe.

Atlanta has eight combined sewer overflows, three of these facilities have been corrected and are currently being treated. The City of Atlanta is currently completing design to construct treatment facilities affecting the other five discharge sewers at an estimated construction cost of $60 million. However, I should point out that EPA has not, at this time, provided definitive regulations or standards concerning CSOs—combined sewer overflows.

There are several laws pending that could require municipalities to provide secondary treatment for combined sewer overflows. However, I am unaware of any of those provisions which provide any significant federal funding for the treatment or the development of—for the development of those systems or the treatment of those overflows.

I sometimes feel, from my perspective today, that the federal government seems to support the position that municipalities and states have the capacity to repair their facilities without federal help. But local officials tell me when faced with dwindling funds and angry taxpayers, they cannot.

Federal mandates are another serious burden on the local level. Particularly problematic are environmental regulations for water, wastewater and storm sewer treatment that require installing systems for nutrient and toxic removal, some of which cannot even be measured by local testing laboratories or equipment available on the market. Urban stormwater run-off has comparable water quality characteristics as the combined sewer overflows that we talked about just a minute ago. Yet the proposed stormwater discharge standards only apply to cities, knowing full well that a majority of what is occurring in our urban areas are outside our existing cities. Federal standards for trace toxins and stormwater quality must be attainable and of course measurable, as well as treatable. Federal and state governments must also look more seriously at the cost of what they mandate. The federal government must become at least a 50 percent partner through loans, grants, technical services or just an available pool of monies that in fact can be returned to a particular fund.

It seems unrealistic and unfair to reduce federal funds which affect a majority percentage of the population when they pay taxes which should assist at or in their local communities.

Cities and counties are exploring any and all new fiscal avenues as a matter of necessity. And Mr. Chairman, I think you alluded to that also earlier, that first look locally. Firsthand, I can tell you that local governments are trying to implement or at least address user fees, which Commissioner Lomax mentioned earlier, developer impact fees, special tax districts and levies which Mayor Massell mentioned earlier, short-term taxes and privatization, all are being used to generate much needed financing infrastructure on the local level. This, however, will not cover the funds needed if a federal mandate is not issued and we try to completely eliminate—if we try to completely eliminate stormwater discharges without federal assistance. The federal government must take a leading partnership role to financially solve this nation's problems in clean air—clean water, excuse me.

Mr. Chairman, I would again like to thank the Committee for this invitation and truly do appreciate the Committee's demonstrated interest in this very important area. Thank you very much.

[The prepared statement of Mr. Gerber appears on p. 1089.]

The **Chairman**. Congressman Lewis.

Mr. **Lewis**. Thank you, Mr. Chairman. I do not have any questions, just thank the members of the panel for being here and being willing to testify and being patient and waiting.

Thank you, Mr. Chairman.

The **Chairman**. Congressman Ben Jones.

Mr. **Jones**. Mr. Chairman, briefly yes, getting back if we could—and maybe Mr. Gerber, you might be able to give us some insight into this—getting back to this Proctor Creek problem. The Environmental Protection Agency, have they been involved in this, Ms. Wheeler?

Ms. **Wheeler**. They are involved in some parts dealing with the landfill, that is another problem there, with some of the local community groups, but not with the creek.

Mr. **Jones**. I just wanted to pursue that just a little bit more, but not at this time. I know our time is short, we have to travel down the road right now, but I do want to thank you both very much for taking the time to testify, and thank you, Mr. Chairman.

The **Chairman**. Well thank you very much.

Mr. Gerber, I have no questions but I want only to point out again the provision that Congressman Lewis authored and which will be on the House floor in September, to have the Army Corps of Engineers examine sewerage overflows into local creeks and the Chattahoochee River, as a necessary first step to solving the problem. I look forward to doing whatever I can to help John Lewis help the local community solve this horrible problem.

Do you want to comment on that, or what thoughts you might have?

Mr. **Gerber**. Mr. Chairman, we are truly grateful for the interest that Congressman Lewis has assigned to this particular problem, and the assistance at the federal level in defining the problem and securing a workable solution is truly important, and we very much appreciate the efforts of the Committee.

The CHAIRMAN. Do you have anything more?

Mr. LEWIS. No, thank you, Mr. Chairman.

Ms. WHEELER. Mr. Chairman, on behalf of the community—I will take liberty to speak for the community—I believe we would appreciate anything that anybody can offer, it does not make any difference where it comes from. And we certainly—if there is anything you need, we will be happy to support you 100 percent, and we would like to go on record supporting that.

The CHAIRMAN. The names are John Lewis and Ben Jones.

Ms. WHEELER. Thank you.

The CHAIRMAN. I would like to close by thanking all of the witnesses for testifying and for helping us better understand the infrastructure needs of this area, and I would especially like to thank Congressman John Lewis and his staff and the people of the Fifth District for their hospitality and their efforts to make this hearing a success, and I believe it has been.

The Committee stands adjourned. Thank you very much.

Mr. LEWIS. Thank you, Mr. Chairman.

[Whereupon, at 12:35 p.m., the Committee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

TESTIMONY PRESENTED TO
REGIONAL HEARING OF THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U. S. HOUSE OF REPRESENTATIVES
ATLANTA, GEORGIA

August 8, 1990

BY
RICHARD ANDERSON, CHIEF FINANCIAL OFFICER, CITY OF ATLANTA

Good morning. I am Richard Anderson, the Chief Financial Officer of the City of Atlanta. On behalf of Mayor Maynard Jackson, who is unable to be with you this morning, I would like to welcome you to Georgia and to Atlanta, and thank you for giving us the opportunity to present to you some of our views on the infrastructure problem. In Atlanta we recognize the importance and necessity of cooperative effort by federal, state, and local governments to insure that cities are equipped to address the needs of their citizens, and we stand ready to do our part.

As a Financial Officer, I am always concerned that people sometimes have a narrow focus on infrastructure. Typically, infrastructure is thought of as sewer systems, wastewater treatment facilities, water treatment facilities and distribution systems, and transportation system components such as roads, streets, bridges and viaducts, and airports. But my definition of infrastructure includes all the capital facilities through which city government delivers its important services: such obvious things as fire stations, detention facilities, and police precincts, such not so obvious things as recreation centers, gymnasiums, swimming pools, police and fire training facilities, and the structures people rarely think of, such as vehicle maintenance facilities, sanitation substations, and the other facilities from which the thousands of city workers construct and maintain the basic infrastructure. These capital facilities are vital to the provision of city services, and in aggregate represent a significant financial requirement, which ends up competing with the larger and more basic infrastructure projects for the precious resources available to local governments.

Although every city is unique in its infrastructure issues, Atlanta is much like most cities in our population range. While we are the central city of a metro area which has sustained unprecedented and continual growth for over twenty years, and have experienced much new development and redevelopment ourselves, we have other areas of the city untouched by those forces, whose infrastructure dates to the latter nineteenth century. As one example of the unique issues facing Atlanta, although we are an inland city, we face a major bridge replacement need. As many of you know, Atlanta was historically a railroad city, and railroad lines were an integral part of downtown Atlanta. As the automobile came into its own, grade separation of the heavy train traffic and vehicular and pedestrian traffic became necessary, and early in this century bridges were built over the railroad tracks on major north-south downtown streets. Thus, Atlanta probably has more miles of bridges than many cities located on a river, because rather than the two or three river crossings typically found we have nine major bridges crossing our railroad "river". And virtually all of these bridges were built prior to 1920. In other cases, the city is often frustrated by the dilemma of trying to invest infrastructure dollars in refurbishing or installing infrastructure in areas of the city to attract the investment or reinvestment of private dollars to provide jobs and housing for our citizens, while also being required to provide infrastructure to support market driven private investment. So we, like most cities, have an infrastructure marked by a mixture of mature and even obsolete components and shiny new facilities brought about by recent growth.

Mr. Chairman, in my remarks today I will focus on two primary areas of concern; environmental facilities and transportation.

ENVIRONMENTAL FACILITIES issues include water treatment and distribution, sanitary sewers and storms and drainage facilities, and solid waste collection and disposal systems.

Atlanta provides water treatment and distribution and wastewater treatment services not only to its resident population base of 435,000, but to more than 1 million citizens in the metro area. As the metro area grows, the demands for water have increased. In order to plan for the long-term water resource needs for the area and region, we must work diligently with federal and state governments to insure that water resources are properly managed and developed so that our needs of today are met and that future generations will continue to have an adequate supply of safe water. This includes providing sufficient treatment plant capacity, water storage, and pumping capacity to accommodate future service area needs.

Many of the city's 2,100 miles of sanitary sewer and storm drainage lines are in poor structural condition and are undersized to serve projected development. Some areas of the city are inadequately served by combined sewers and the attendant outfall problem. We estimate that our current spending levels for replacement of these sewer lines are only about one-tenth of what is needed. In the area of storm drainage, we have identified an estimated $125 million in costs needed to improve storm drainage in the various drainage basins around the city.

And finally in the environmental category, we face the same solid waste management and disposal issues which are gaining so much attention around the country. We perhaps have more landfill capacity remaining than many jurisdictions, but basic needs remain to minimize waste streams and recover resources from the waste stream.

TRANSPORTATION

Atlanta has long been the regional transportation hub for the southeast. Our highway and expressway systems provide local transportation and a smooth and vital linkage between regions of the country. Through Hartsfield Atlanta International Airport, we have always been the gateway to the southeast, and increasingly are becoming the gateway from the southeast to the world.

Our local transportation system is centered around our highway system and the Metropolitan Atlanta Rapid Transit Authority (MARTA) system of fixed rapid-rail and bus routes, one of the nation's most modern, efficient, and convenient. The city maintains some 1,440 miles of surface streets and 159 bridges and overpasses. The maintenance and improvement of this street and bridge network is an expensive proposition. Nearly fifty percent of the city-maintained bridges are structurally or functionally deficient and in need of remedial work or replacement, at a cost estimated to be $200 million.

To make the surface transportation system work better, we have a vital need for improvement to the traffic control systems to incorporate new technology which will make it possible to better manage the flow of traffic and to make surface transportation systems operate more efficiently. This effort has a big payoff in convenience and saved time to the traveling public, as well as energy savings associated with more efficient vehicle movement. The replacement of obsolete mechanical traffic signals and the upgrade of the traffic control system, to be implemented over a 10-year period, is a $40 million project.

Since you have a separate panel today focusing on aviation issues, the city will defer comments on this critical transportation component to that forum.

You can see from the preceding that in the categories of environmental facilities and transportation our needs are great, and when combined with all our other capital needs, ongoing operating requirements, and the needs of other jurisdictions which call upon the same tax base, such as the educational system and county government, overwhelm the ability of locally raised revenues.

From my perception as a city financial officer, I am greatly concerned over changes in the traditional funding of development of local infrastructure. Much of the existing infrastructure in Atlanta was funded with heavy federal participation, but today, we find that federal support virtually nonexistent. General Revenue Sharing which many cities used for infrastructure improvements, has been eliminated entirely. The HUD categorical grant programs of the late sixties and early seventies were consolidated into the Community Development Block Grant (CDBG) entitlement program, and we found our funding levels for infrastructure significantly reduced in that consolidation. Since the inception of CDBG, our annual entitlement has shrunk from a nominal level of over $18 million to $9 million, superficially a fifty percent reduction, but when the impact of inflation is considered, our CDBG funding level is more like 20% of what it was fifteen years ago. and infrastructure needs compete with a host of public services, economic development, and housing needs. In Georgia, direct state aid to Atlanta for infrastructure is limited mainly to highway projects, so that reduction in federal support must be made up through purely local dollars. To add injury on top of injury, we now hear federal budget strategies discussed which would eliminate the federal income tax deductibility of state and local taxes, and we must always be vigilant to ward off attacks on the tax deductible status of income from local government bonds. All these actions would simply make it more difficult and more expensive for local government to raise revenues locally to meet infrastructure needs.

I believe there are compelling and sound arguments for major state and federal participation in the funding of local government capital facilities. Atlanta represents a good example of the dynamics at work. Atlanta is roughly 20% of the population of the metropolitan area, but contains most of the major educational institutions, the regional hospitals, major religious institutions, regional recreational facilities such as stadia, major parks, the zoo, and museums, and is host to the state capital and major federal facilities. Virtually all the property engaged in the above activities is exempt from city of Atlanta taxes. The infrastructure necessary to support those facilities, which serve the metro area, the state, and in some cases a southeastern region or national contingency, simply cannot be paid for primarily by the taxpayers of the city of Atlanta. While logic suggests that some of the funding inequities created by these roles should be corrected at the state level, the political reality is that is not the case to any great extent. Thus, we have historically depended upon the federal government to provide some of the equity through distribution of federal revenues. It is that historical role of the federal government which we see as abandoned.

In closing, we see a basic need for a comprehensive and cooperative effort by federal, state and local governments to insure that the needs of our citizens are met. Atlanta is committed to taking the steps necessary to provide for infrastructure needs, and is maximizing the use of revenue bonds and user fees. But we are constrained by outdated limits on our general obligation bonding capacity, and frustrated by our need to provide the infrastructure to attract private investment versus the need to provide infrastructure for market driven development. We need and solicit your support as you study federal options to address this critical issue.

I want again to thank you for holding this hearing in Atlanta and giving us the opportunity to share with you our thoughts on infrastructure needs.

Prepared Statement of Philip Boyd

ATLANTA REGIONAL COMMISSION TESTIMONY BEFORE THE US HOUSE OF REPRESENTATIVES' COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

August 8, 1990

The Atlanta Regional Commission (ARC) appreciates the opportunity to present this testimony to the Committee on Public Works and Transportation as it examines the infrastructure needs of the Atlanta Region and the nation.

For the members of the Committee who are not familiar with ARC, a little background information may be helpful. The Atlanta Region has a long history of regional planning and cooperation. In fact, ARC's predecessor, the Metropolitan Planning Commission, was established in 1947 as the first regional planning agency in the nation to be supported from the start with voluntary local contributions. The MPC served the City of Atlanta, Fulton and DeKalb Counties. Over the years, however, the organizational structure changed and the area of jurisdiction expanded so that now, more than 40 years later, over 2.4 million people in the City of Atlanta and the eight surrounding counties benefit from ARC's coordinated, cooperative approach to addressing issues of regional concern.

ARC was created in 1971 by local governments under state enabling legislation and assists local governments in planning for highway and transit improvements, water and wastewater treatment facilities, community services, aviation facilities, parks and open space and a host of other facilities and services. Because of the Region's long-standing role as the Southeast's major surface and air transportation hub, planning for the Region's transportation needs is one of the Commission's top priorities. Today's testimony centers on the findings and recommendations of the two major transportation planning efforts undertaken by ARC within the last several years: The Regional Transportation Plan, which addresses surface transportation needs, and the Atlanta Region Airport System Plan, which deals with the Region's commercial and general aviation needs.

Regional Transportation Plan: Surface Transportation Needs

In the mid-1980's ARC and its partners in the transportation planning process began to examine the Region's surface transportation needs to the year 2010 as part of a major update of the Regional Transportation Plan (RTP). As we looked at our forecasts of population and employment growth, past trends and our existing highway and transit network, four major issues emerged. As we examined these issues further, we realized that they were not unique to this Region, but aspects of a national phenomenon brought about by the changing nature of America's major metropolitan areas. These issues are as follows:

- Cross-Regional Congestion

  Forecasts used as a basis for the RTP Update indicate that the rapid growth in population and employment experienced in the suburban portions of the Atlanta Region will continue well into the next century. As these suburban areas grow and mature, employment opportunities will expand and an increasing number of vehicle trips will be between suburban areas, rather than from suburban areas of the Region to a central location. Further evidence of changing travel patterns is provided by ARC's transportation models which utilize demographic data and information about the existing and planned road and transit network to predict future traffic levels and patterns on the Region's road system. These forecasts indicate that an increasing proportion of the travel in the Region will be from one suburban location to another. This shift in pattern holds true for work and non-work trips alike.

Thus, by the year 2010, while radial commuting patterns still account for a large portion of the Region's vehicle trips, cross-regional movements account for an increasing share of the Region's traffic. Unfortunately, the existing road network simply does not provide sufficient capacity to accommodate the tremendous increase in traffic that will accompany the growth forecasted to occur throughout the Region. Additionally, few direct routes exist for cross-regional traffic outside of Atlanta's Perimeter Interstate Highway (I-285), making cross-regional travel not only congested, but circuitous.

o Radial Highway Congestion

Another major issue facing the Atlanta Region in the period between now and 2010 is the congestion of radial portions of the regional freeway system, particularly outside of Interstate 285. This congestion results from rapid suburban growth both within and external to the Atlanta Region and is compounded by the lack of capacity on cross-regional transportation facilities.

Rapid suburban growth has been and will continue to be a major factor in the growth of vehicle trips using the radial freeway system. Growth of population and jobs in these areas point to continued growth of vehicle trips bound from suburban locations to employment centers in other suburban locations as well as to downtown Atlanta and other major activity centers within I-285. Because of inadequate capacity on available cross-regional facilities, persons desiring to travel from one suburban location to another often must use the radial freeway system in connection with I-285 to reach their destination. The result is congestion on the radial highway system, particularly in areas just outside or inside I-285 but also on the major interchanges linking I-285 to the radial highway system and on I-285 itself.

ARC's transportation models indicate that the congestion problems on the radial highway network resulting from rapid suburban growth within the Atlanta Region are compounded by the growth of trips to and from areas external to the Atlanta Region. In 1980, approximately 393,000 vehicle trips each day began or ended outside the seven county Region. This represented 9 percent of all the Region's vehicle trips but will swell to over 841,000 trips each day. The greatest percentage of these external trips either begin or end in "near external" counties adjacent to or within the vicinity of the Atlanta Region. Nearly 80 percent of the next external trips are work trips, primarily by persons living in external counties and commuting to jobs within the Atlanta Region.

A final factor that will play a role in the congestion problems on radial facilities is the unlikelihood of further widening on most radial freeways. The Atlanta Region is nearing the completion of a massive "freeing the freeways" project which has widened most Interstate segments in the Region to 10 lanes. Several considerations limit the number of additional lanes that can be constructed: there is very little room to widen these facilities in their most congested sections, the cost of additional rights-of-way are prohibitive in many cases, there is great concern about the environmental effect of such widenings and safety issues indicate these facilities have reached their maximum number of lanes.

- The Need for Transit

Another major issue identified in the RTP Update process was the need for transit in some form in all of the Atlanta Region's counties. In fact, this was more a reaffirmation of the need for transit consistently identified since the mid-1970's. This restated need for transit comes in light of increasing suburban growth, the proximity of jobs to existing and proposed transit stations and the continued congestion on the Region's highway facilities despite extensive improvements to provide additional capacity. While the transit mode appropriate to each jurisdiction will vary, as will the form of ownership, management and operation, the information brought to bear on the RTP Update process clearly illustrates the need for transit throughout the Region.

For example, ARC's transportation models indicate that, despite substantial improvements to the highway system, almost 47 percent of the vehicle miles travelled in 2010 will be on facilities that are subject to peak period volumes in excess of their capacity. Though transit cannot remedy this situation entirely, it can provide a degree of relief to the highway system.

- Activity Center Congestion

A final major concern raised by the studies associated with the RTP Update is congestion in the Region's major suburban activity centers. The growth of these concentrations of employment throughout the Region has been well documented in previous ARC studies. Other studies throughout the nation attest to the challenge of providing adequate transportation and other services to suburban activity centers.

The traffic problems associated with activity centers include: the convergence of local traffic bound for jobs, shopping or other local destinations with through traffic destined outside the activity center; coarse and irregular street patterns, often without sufficient capacity; and a lack of pedestrian ways, convenient transit or paratransit options. Additional problems identified included rapid changes in land use patterns; diffuse trip origins; unconstrained, often free parking; poor coordination between developers, transit operators and property managers; and design constraints.

To address these major issues, as well as other mobility problems identified through the RTP process, the regional planning process developed a comprehensive plan of projects which combined highway and transit improvements. The updated RTP includes 625 road projects, an additional 42 miles of rapid rail transit with 20 rail stations and a coordinated network of bus transit in all seven Atlanta Regional counties. This $5.7 billion plan recommends extending rail service into Gwinnett County, the nation's fastest growing large county according to the U.S. Census

Bureau, and constructing an outer perimeter highway encircling the Region approximately 15-20 miles outside the existing perimeter highway.

This is an ambitious plan, but one that must be followed if we expect to meet the mobility needs of a Region expected to contain over 3.7 million people and nearly 2.4 million jobs by the year 2010. Even if all the projects in the RTP are implemented during the planning period, the overall level of congestion will improve only slightly as compared to today's level.

This is only a brief summary of the major challenges facing the Atlanta Region. As noted earlier, these problems are not unique to our Region. Neither are they a complete description of the challenges ahead of us as a Region or nation as we move toward the 21st century.

Transportation System Management

Other transportation solutions that we feel must be examined by the Committee are the low capital cost means by which we can more effectively and efficiently manage existing facilities and reduce the demand for additional facilities. These methods and approaches are referred to as "transportation system management", "demand management" or "demand reduction" strategies and include such steps as widespread support of vanpools, carpools, ridesharing or transit use; staggered work hours to lessen peak hour traffic levels and increased use of High-Occupancy Vehicle lanes on our urban freeways. These are but a few of the many relatively low cost approaches which have been implemented or considered in a few parts of the nation and which can provide us with a more efficient transportation system. The Atlanta Region's RTP calls for the 58 miles of high-occupancy vehicle lanes already constructed or under design on the Region's Interstate highways to be placed in operation.

"Incident Management" is another term that we must become familiar with as we search for ways to make our highway systems more efficient. An inordinate amount of the congestion on our nation's highways is caused not by a lack of capacity, but by accidents or other incidents which block traffic or otherwise restrict the functional capacity of a facility. We must find better ways to monitor our urban and suburban highway facilities, identify trouble spots and move quickly and effectively to restore the facility to its intended capacity. By the end of 1990, ARC will have completed a study examining the potential impact of effective incident management techniques on reducing freeway congestion in our Region.

Other Policy Issues

Several major policy issues stand out as we move out of the era dominated by the construction of our Interstate Highway system. These are:

- The appropriate Federal role in post-Interstate surface transportation programs;
- The mechanism and programs that should be continued or instituted to ensure adequate and equitable funding for needed improvements; and

- The governmental structure that will most effectively and efficiently address the changing nature of the nation's mobility requirements.

The Federal Government's Role

Clearly there is a need for a continued Federal presence in surface transportation issues in the coming decades. The objective of maintaining a healthy national economy is of national significance and is a basic aim of the Federal Government. The Federal Government has helped to create one of the world's best transportation networks and is the proper entity to assure the proper stewardship of that network. Additionally, the tremendous changes to urban areas brought about by the Interstate system have given rise to new challenges. The importance of local roads in urban and suburban areas and their value in sustaining the local and national economy must not be overlooked.

Likewise, the maintenance and improvement of transportation infrastructure will require more capital than can be raised locally. The Atlanta Region's RTP contains nearly $3.3 billion in highway improvements. Of these, only $1.2 billion are anticipated to be funded with federal dollars. Local, state and other funds will account for the remaining $2.1 billion. These local funds will be raised through a variety of means, including sales tax referenda, developer impact fees, community improvement districts and other measures. With transit, operating and capital expenses are offset with local option sales tax revenues as a means of reducing the non-local share of transit expenses. Clearly, local governments in the Atlanta Region have made a strong commitment of resources toward the Region's transportation infrastructure; but this will only take us so far. The Federal government should and must contribute to the ongoing maintenance and improvement of our transportation system.

Surely, the Federal Government cannot sustain the nation's transportation system alone. State and local governments - as well as the private sector - must work together with the Federal government to meet the nation's needs. Still, the need for a continued, strong Federal role is evident.

The overall objective of the Federal Government's role in future transportation programs should be to support and enhance the economic vitality of our nation as a whole by providing for the orderly and efficient movement of goods and people at a national, state, regional and local level. To do this, Federal transportation programs over the next three decades should encourage the maintenance of existing facilities and the expansion of facilities or provision of new facilities to accommodate the level and pattern of anticipated growth.

Maintaining the existing transportation infrastructure is an enormous but necessary task. The National Council on Public Works Improvement and the National Transportation Policy point out the indisputable connection between the vitality of the nation's economy and the condition of its infrastructure. These sources clearly state that the nation cannot maintain its economic growth while it allows the infrastructure that supports that growth to deteriorate. The interstate highway system, now nearly complete, will require continued investment and improvement if it is to provide the level of service needed to accommodate future growth. A disturbingly high number of the nation's bridges are deteriorating.

indicating the need to concentrate efforts on maintaining this essential element of the transportation network. As an example, a 1984 ARC study found that 32 percent of all bridges in the Region were either structurally deficient or functionally obsolete. Millions of dollars are needed to correct these problems.

Though the Atlanta Region's transit system is young by comparison to other systems in the nation, we cannot ignore the need to maintain its good condition on an ongoing basis. Likewise, it is clear that major investments will be required to maintain adequately the nation's transit network. Transit is an essential element in any balanced transportation network. It provides relief to the highway system and mobility to many who have no other transportation options. It is incumbent that we keep these systems functioning well.

As noted earlier in this testimony, one of the major challenges ahead of the Atlanta Region and all major metropolitan areas is the provision of adequate transportation facilities in suburban areas. New efforts are needed to provide for the mobility needs of America's suburbs through highway and transit facilities and programs tailored to meet the unique needs of these areas. The Urban Mass Transportation Administration recently has begun to address this need through its Suburban Mobility Initiative. Efforts such as this need to continue and expand if we are to successfully meet suburban mobility needs.

As the MPO for the Atlanta Region, ARC is also keenly aware of the transportation needs of urban America. Despite strong suburban growth, urban areas continue to function as significant economic powers and cultural centers. To ignore the needs of the nation's urban areas by neglecting to maintain and expand the highway and transit system serving those areas would be economically devastating.

Program Elements and Funding Mechanisms

In the coming decades, Federal programs and funding should be designed to encourage the fulfillment of the program objectives outlined previously. Thus, Federal support should:

- ensure the Interstate system is maintained through a continuation and expansion of the Interstate 4R program or a similar initiative;
- assist in improving mobility in suburban, urban and rural areas through a combination of highway and transit programs;
- encourage the development of new and innovative means to utilize existing and planned capital facilities much more efficiently and reduce the demand for new facilities through changes in commuting habits, work hours and the like;
- continue the rehabilitation of the nation's bridges; and
- support the maintenance and expansion of transit systems in urban, suburban and rural areas serving traditional riders as well as special populations such as the elderly and handicapped.

Program funding should be flexible and user fee based. The Highway Trust Fund, including its Mass Transit Account, are resources that should remain intact and dedicated to projects aimed at maintaining and strengthening the nation's transportation infrastructure. Using the balance of the Trust Fund to artificially offset the Federal deficit is a self-defeating process that should be discontinued by taking the Trust Fund "off-budget." This will allow greater investment in the infrastructure needed to support growth and help to reduce deficits naturally.

Atlanta Region Airport System Plan - Air Carrier Component

It is clear to all observers that we also face a pressing need to provide additional capacity and a greater degree of safety to our nation's commercial and general aviation system. In the Atlanta Region, we recognize the vital importance of adequate and safe air transportation facilities. The Atlanta Region's only air carrier airport, William B. Hartsfield Atlanta International Airport, is one of the busiest airports in the world, and contributes nearly $8 billion each year to the economic health of the Region. However, a recently completed ARC update of the air carrier component of the Atlanta Region Airport System Plan indicates that, in addition to technological, operational and capital improvements at Hartsfield, the Region must have another air carrier airport in place by the end of the century if we intend to meet the demand for air travel generated by the continued growth of the Region's population and employment base. To fail to do this would be akin to economic suicide.

Atlanta, like the nation as a whole, depends more and more on air transportation. We are moving forward with our regional efforts to identify the best possible site for this much-needed second air carrier facility, and appreciate the federal government's continued support of our work. The nation's need for additional aviation facilities is critical and we encourage Congress to make the improvement and expansion of the nation's airport and air traffic system a cornerstone of any effort to address the nation's infrastructure needs.

Governmental Structure

The final challenge as we move toward the 21st century is to identify and support a structure to effectively and efficiently address the nation's changing mobility needs. It is our belief that the currently established intergovernmental structure which utilizes substate regions as the forum for continuing, comprehensive and coordinated planning has performed well and should be continued on the basis of its success.

The Atlanta Region's experience with this process has been a positive and constructive one. It has helped us to cooperatively and efficiently allocate local, state and national resources to meet the Region's mobility needs in a balanced way. It has provided an effective link between the Federal Government and local policy makers and has ensured decisions that recognize national and local priorities on an equal basis. This structure should be continued, strengthened and perhaps even expanded to include non-metropolitan areas of the nation. As it has in the past, the MPO-based planning process should serve to integrate national priorities and local needs in an efficient, effective manner.

In conclusion, it is clear that we face many new challenges, both locally and nationally, as we approach the 21st century. The Interstate Highway system has played a key role in transforming the shape of American metropolitan areas. Furthermore, it has been an essential element in supporting economic growth throughout the nation. As we move toward the year 2000 we must address the new priorities and mobility needs of the nation. There is a clear need for the Federal Government to play a strong role in this process in order to ensure the nation's continued economic vitality.

This ultimate objective can be achieved by efforts to sustain the Interstate Highway network; strengthen urban, suburban and rural areas and provide for a balance of highway and transit in an integrated, complimentary system.

Federal programs should ensure orderly development and efficient utilization of funds with minimal distortion. Additionally, the cost of improvements to the nation's transportation system should be shared by users of that system through the continued utilization of the Highway Trust Fund and its Mass Transit Account.

Finally, the forum for local decision makers to establish priorities, coordinate their efforts with Federal priorities, and move toward meeting the transportation challenges of the 21st century should be the substate regional and metropolitan planning process that has served the nation and local governments so well in the past.

ARC appreciates and applauds the Committee's leadership and the dedication as it works to address the nation's infrastructure needs. We will continue to support this effort in any way we can and look forward to working together with you as well as our local state partners in the planning process to meet the future mobility needs of our Region and the nation.

Presented by John Braden

STATEMENT OF

COMMISSIONER IRA JACKSON

CITY OF ATLANTA

AT

CONGRESSIONAL HEARING

AUGUST 8, 1990

MR. CHAIRMAN AND MEMBERS OF THIS SUB-COMMITTEE. I AM IRA JACKSON, COMMISSIONER-DESIGNATE OF THE DEPARTMENT OF AVIATION OF THE CITY OF ATLANTA. I THANK YOU FOR THE OPPORTUNITY TO APPEAR BEFORE YOU TODAY IN ORDER TO PRESENT TESTIMONY CONCERNING THE CAPITAL IMPROVEMENT NEEDS OF HARTSFIELD ATLANTA INTERNATIONAL AIRPORT. IT IS THE JOB OF THE DEPARTMENT OF AVIATION TO OPERATE AND MAINTAIN THE WORLD'S SECOND BUSIEST AIRPORT AN AIRPORT THAT PROVIDES EMPLOYMENT FOR MORE THAN 38,000 PEOPLE AND AN AIRPORT THAT MANY CONSIDER TO BE THE ECONOMIC ENGINE OF THE ENTIRE ATLANTA METROPOLITAN AREA.

MR. CHAIRMAN, MY REMARKS TO YOU TODAY CONCERN THE NEEDS ASSOCIATED WITH MAINTAINING OUR POSITION IN THE WORLD WITH RESPECT TO AVIATION, TOURISM, BUSINESS DEVELOPMENT AND THE GREAT PROGRESS OUR CITY HAS MADE IN THE PAST THIRTY YEARS THAT ARE ATTRIBUTABLE TO THE AIRPORT. THESE ARE NEEDS THAT CAN ONLY BE FULFILLED THROUGH THE CONTINUED COOPERATION BETWEEN THE FEDERAL

GOVERNMENT AND THE CITY OF ATLANTA. THIS OF COURSE, IMPLIES THE IMPORTANCE OF CONTINUING FEDERAL SUPPORT FOR THE NATION'S AIRPORTS.

OUR NEEDS MUST BE THOUGHT OF IN TERMS OF SHORT-TERM AND LONG-TERM SOLUTIONS; THE FIRST BEING THE PERIOD FROM THIS YEAR, 1990, THROUGH 1995. THE LONG-TERM BEING FROM 1996 THROUGH 2005.

WE CAN FUND SMALL IMPROVEMENTS FROM OUR ANNUAL SURPLUSES DERIVED FROM ANNUAL OPERATING REVENUES. LARGER EXPENDITURES ARE FUNDED BY AIRPORT REVENUE BOND ISSUES. NEITHER OF THESE, HOWEVER, ARE SUFFICIENT WITHOUT THE AIRPORT IMPROVEMENT PROGRAM OR ITS SUCCESSOR.

OUR SHORT-TERM NEEDS CAN BE DIVIDED INTO THE FOLLOWING CATEGORIES:

1.) BUILDING AND SERVICE ENHANCEMENTS
2.) AIRFIELD IMPROVEMENTS
3.) NOISE MITIGATION

THE FIRST CATEGORY INCLUDES EXPANSION OF THE PRESENT TERMINAL COMPLEX. THESE ADDITIONS ARE PRIMARIY FOR THE BENEFIT OF THE PASSENGERS AND WILL PROVIDE MORE OPEN AREAS AND CONCESSION SPACE IN THE MAIN TERMINAL AND EACH OF THE FOUR DOMESTIC CONCOURSES. A SMALL PART OF THIS IS ALREADY UNDERWAY. WITH THE EXPANSION WE MUST INCLUDE MODIFICATIONS TO SUPPORT FACILITIES, ROADWAY AND PARKING IMPROVEMENTS. WE MUST UPGRADE OUR SECURITY SYSTEM TO MEET NEW FEDERAL REQUIREMENTS. WE HAVE SCHEDULED CARGO RAMP

IMPROVEMENTS AND A MUCH NEEDED EXPANSION OF OUR PRESENT FEDERAL INSPECTION SERVICES BUILDING (INTERNATIONAL ARRIVALS AREA). THESE ITEMS ALONE AMOUNT TO $84.7 MILLION AND ONLY BEGIN TO ADDRESS OUR NEEDS. THE LARGEST AND MOST EXPENSIVE ITEM IN THIS CATEGORY IS THE NEW INTERNATIONAL CONCOURSE WHICH WE HOPE TO HAVE UNDER CONSTRUCTION BEFORE THE YEAR IS OVER. THOUGH OUR CURRENT INTERNATIONAL CONCOURSE, WHICH HAS BEEN DOUBLED IN SIZE SINCE THE TERMINAL OPENED IN 1980, IS NOT LARGE ENOUGH TO MEET THE EXPECTED DEMAND IN 1991, WE CANNOT COMPLETE THIS $277-MILLION PROJECT BEFORE LATE 1993. (CHANGES BEING CONSIDERED NOW COULD INCREASE THE COSTS OF THE PROJECT BY MORE THAN $100 MILLION).

AIRFIELD IMPROVEMENT NEEDS FALL INTO A "MUST DO" CATEGORY. PAVEMENT REPLACEMENTS AND SUPPORT FACILITY IMPROVEMENTS WILL COST US $32.4 MILLION BY THE END OF 1995, BUT OUR MOST IMPORTANT NEED IN THIS AREA IS FOR THE CONSTRUCTION OF A FIFTH PARALLEL RUNWAY, WHICH IS CURRENTLY PROJECTED TO COST $143.2 MILLION.

THE LAST CATEGORY FOR SHORT-TERM NEEDS IS ONE OF GREAT PRIDE TO THE CITY OF ATLANTA. IT IS OUR NOISE MITIGATION PROGRAM WHICH HAS BECOME A STANDARD FOR AIRPORTS WORLDWIDE. IN ORDER FOR US TO COMPLETE THE CURRENTLY APPROVED MEASURES THROUGH FEDERAL FISCAL YEAR 1996, WE WILL SPEND $173,985,000. OF THAT AMOUNT, WE EXPECT FEDERAL TRUST FUND MONIES WILL PROVIDE $123,588,000; THE BALANCE WILL COME FROM AIRPORT GENERATED REVENUES AND ANTICIPATED LAND SALE PROCEEDS.

NOW LET ME TURN TO OUR LONG-TERM NEEDS WHICH CAN BE

SUMMARIZED IN THREE CATEGORIES.

1.) AIRPORT ENHANCEMENT
2.) NOISE MITIGATION
3.) SECOND AIR-CARRIER AIRPORT

OUR ENHANCEMENT PROGRAM FOR 1996 THROUGH 2005, CONSISTING OF AIRFIELD REPAIRS, TERMINAL BUILDING MODIFICATIONS AND ROADWAY IMPROVEMENTS, IS ESTIMATED TO COST $93.2 MILLION.

THE NOISE MITIGATION PROGRAM WHICH IS CURRENTLY SCHEDULED TO BE COMPLETED IN FEDERAL FISCAL YEAR 1998 WILL COST $61,794,000. WE ANTICIPATE RECEIVING $49,435,000 OF THIS AMOUNT FROM THE FEDERAL TRUST FUND.

FINALLY, BUT OF EXTREME IMPORTANCE TO ATLANTA, WE ARE FACED WITH THE NEED FOR AN ADDITIONAL AIRPORT TO ACCOMMODATE THE GROWTH OF ATLANTA AND THE AREA SERVED BY HARTSFIELD ATLANTA INTERNATIONAL AIRPORT. THE ATLANTA REGIONAL COMMISSION IS CURRENTLY CONDUCTING A STUDY TO, HOPEFULLY, DETERMINE THE BEST SITE FOR THIS NEW AIRPORT WHICH WILL BE DESIGNED TO SUPPLEMENT, NOT REPLACE, HARTSFIELD. MANY IMPORTANT DECISIONS ARE YET TO BE MADE CONCERNING THE SIZE OF THE INITIAL PHASE OF THE SECOND AIRPORT, BUT WE KNOW THAT WE ARE FACED WITH A MINIMUM OUTLAY OF $400,000,000 FOR THIS PROJECT. IT IS QUITE POSSIBLE THAT, BY THE YEAR 2005, WE MAY HAVE TO EXPEND UP TO $1 BILLION.

IN CLOSING, I WOULD LIKE TO THANK YOU FOR THE OPPORTUNITY TO

PRESENT THIS INFORMATION TO YOU; AND I WOULD LIKE TO PLEDGE MY SUPPORT TO YOU AND THE U.S. CONGRESS TO MAINTAIN AND EXPAND ATLANTA'S PRE-EMINENCE IN AIRPORT SERVICES. I LOOK FORWARD TO WORKING WITH YOU IN THE FUTURE AND I WILL BE HAPPY TO SUPPLY YOU WITH ANY ADDITIONAL INFORMATION WHICH YOU MAY REQUIRE.

Testimony
of
Robert E. Gerber
to
The U.S. House of Representatives Public Works Subcommittee
August 8, 1990

Mr. Chairman, I am Bob Gerber, Chairman of the Metropolitan Atlanta Chamber of Commerce Water Quality Task Force. On behalf of the Atlanta Chamber of Commerce I wish to thank you for your invitation to testify before this subcommittee. Today I wish to address water quality issues related to the infrastructure needs of the Atlanta region. I am testifying as a concerned businessman and former county public works and planning director. I became involved with Chamber activities related to infrastructure improvement years ago, feeling that private sector cooperation and input is vital in an effective infrastructure system.

As the Chairman of the Water Quality Task Force, I oversaw the development of the Chamber's Long-Range Planning Document. The report addresses many pertinent concerns related to water quality in the Atlanta Region appropriate for support by the Atlanta business community.

Water quality and economic development are inextricably linked. The capacity to attract and sustain new jobs and new homes, guard public health and enhance regional recreation resources are factors in the struggle to maintain an effective, equitable system of water quality management and an attractive quality of life.

It is unquestionable that Atlanta and all the jurisdictions adjacent to the Chattahoochee River must improve water quality in the river to secure an adequate water supply. Our downstream as well as all neighbors have the right to expect a reasonable volume of clean water. Local, State and Federal governments, business and civic interests must address and find solutions to improve water quality in our region.

Non point and wastewater treatment facilities remain a potential source affecting water quality. A study of the region's wastewater flow projections done in 1986 by the Atlanta Regional Commission (ARC) showed that and most of the region will be nearing planned capacity by 2010. To meet 2010 capacity needs, assuming water quality standards remain constant nearly every wastewater treatment plant in the region will have to be expanded or upgraded during the next 20 years. Local jurisdictions may continue to experience temporary moratoria over the next several years if growth exceeds plant construction schedules or if water quality standards are non restrictive. Many of the difficulties in meeting wastewater treatment capacity and quality arise from citizen opposition, growth pressures, changing water quality standards affecting the design, permitting and construction lead time requirements, and service areas based primarily on political boundaries rather than natural drainage basins.

An additional water quality issue deserving aggressive attention is combined sewers. Over 1,700 cities in the United States are affected. Combined sewers are designed to carry both sewer and stormwater runoff in the same pipe. When it rains, large volumes of stormwater return to streams untreated. The point where the stormwater and sewage mix is diverted to area streams is termed a combined sewer overflow (CSO).

Atlanta has nine combined sewer overflows (CSOs). Three CSO facilities have been constructed to collect and treat the first flush of a storm event. The remaining five CSOs currently discharge both stormwater and sewage into several area streams, during high intensity rains. The City of Atlanta is currently completing design to construct CSO treatment facilities affecting the five discharge sewers at an estimated construction cost of 60 million dollars. Plans are to screen and chlorinate the overflows. It should be noted that EPA has not, at this time, provided definitive regulations or standards for CSOs.

There are several laws pending that could require municipalities to provide secondary treatment of combined sewer overflow. Senator Mitchell (D-Maine) has proposed a bill affecting the Coastal and Great Lakes region that also addresses coastal CSO concerns. It does not, however, provide for any federal funding for treatment systems.

Mr. Chairman, I wish to note here that the City of Atlanta has corrected these sewer overflows at a cost of $40 million as part of the Three Rivers Water Pollution Control Project completed in the early 1980s. The improvements consist of a tunnel and first flush retention tank systems into which sewage is diverted during a storm event.

The State of Georgia enacted legislation requiring the permitting of CSOs by July 1991. The City of Atlanta and Fulton County have formed a task force to devise ways to reduce CSO events. A number of steps are already being taken. The City has adopted several management and maintenance changes that should reduce the frequency of overflows preparatory to the construction of the treatment improvements now under design.

Some experts foresee the elimination of CSOs as an inevitability. Others claim that this measure is too costly. One thing is clear. The federal government is continuing to cut back dollars to cities and counties. In the American City and Counties annual public leader's survey, local officials reported that their overall infrastructure deterioration is increasing. Of the respondents, 44 percent said the need for repairs was serious or very serious, while 49 percent listed their repairs as moderate. However, almost 60 percent of the respondents said their need for new infrastructure was moderate, and 39 percent reported their need for new facilities and structures as serious.

The federal government seems to support the position that municipalities and states have the capacity to repair their facilities without federal help. But local officials, when faced with dwindling funds and angry taxpayers, say that they cannot.

Federal mandates are another serious burden on the local level. Particularly problematic are environmental regulations for water, wastewater, and stormwater treatment that require installing systems for nutrient and toxic removal. Urban stormwater run off has comparable water quality characteristics as CSO discharges. Yet, the proposed stormwater discharge standards only apply to cities! Federal standards for trace toxins and stormwater quality must be attainable and measurable. Federal and state governments must also look more seriously at the cost of what they mandate. The federal government must become at least a 50 percent partner.

It seems unrealistic and unfair to reduce federal funds which affect the major percentage of population (urban dwellers) when they pay taxes which should assist in their local community.

Cities and counties are exploring any and all new fiscal avenues as a matter of necessity. Implementation of user fees, developer impact fees, special tax levies, short-term taxes and privatization all are being used to generate much needed financing for infrastructure. This, however, will not cover the funds needed if a federal mandate is issued to eliminate CSOs, or completely resolve stormwater discharges. The federal government must take on a leading partnership role to financially solve this national problem.

Mr. Chairman, I would again like to thank the subcommittee for their invitation and demonstrated interest in this very important, and until recently silent crisis facing our community.

TESTIMONY PRESENTED
BEFORE THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE
BY THE
METROPOLITAN ATLANTA RAPID TRANSIT AUTHORITY

2424 Piedmont Road, N.E.
Atlanta, Georgia 30324

AUGUST 8, 1990

WELCOME

My name is Ken Gregor. I am General Manager of MARTA, the Metropolitan Atlanta Rapid Transit Authority. On behalf of MARTA, I want to welcome you, Mr. Chairman, and the members of the House Public Works and Transportation Committee to the City of Atlanta. As you look around our city, I am sure you will understand the pride we feel for our home and the pleasure we receive when we can share our home with guests.

HISTORY AND OVERVIEW

Increasingly, Atlanta is attracting greater numbers of guests from around the nation as well as from around the world. The City has become a Mecca for conventions and trade shows. We successfully hosted the National

Democratic Convention and are scheduled to host the 1994 Superbowl. Atlanta is in close competition and, some say, leading the bid to host the 1996 Olympics. Atlanta is also in the running as the U.S. host for the 1994 World Cup Soccer competition. Many of our guests come for a visit and decide to stay and make their homes in the Atlanta Region. The Atlanta Metropolitan Area is one of the fastest growing regions in the nation.

The quality of life in our city has done much to attract the economic development that drives our growth. In many respects the quality of life is dependent on the adequacy of our infrastructure and rapid transit is considered a vital part of that infrastructure. Recognizing how vital mass transit is to the economic and social well being of this community, voters in the City of Atlanta and Fulton and DeKalb County approved a comprehensive public transportation plan in 1971. The document set forth plans for bus improvements as well as construction of a rapid rail transit system.

At that time the voters also imposed upon themselves a 1% local option sales tax to pay for these improvements and the new rail system. Additionally, that same year the transit system was awarded the largest single grant ever given to a new transit system by the Urban Mass Transportation Administration. This was the genesis of the Metropolitan Atlanta Rapid Transit Authority - MARTA. Through MARTA the citizens of the Atlanta region can document nearly two decades of commitment to local funding support for mass transit and to the local - federal partnership upon which our success so clearly rests.

MARTA is an independent single purpose agency created by the Georgia General Assembly to plan, build and operate public transportation in Metropolitan Atlanta. At the present time the System serves the three most populous jurisdictions in the Atlanta Region: the City of Atlanta, DeKalb County and Fulton County. (Very limited service also extends into Cobb, Clayton and Gwinnett Counties.) All of the 5th Congressional District is in the MARTA service district as well as a substantial portion of the 4th Congressional District.

Since 1971 MARTA has made numerous capital and service improvements involving the Bus System: new equipment; new Maintenance and operating garages; passenger shelters; new bus routes; improved frequencies; extended operating hours; improved schedule information; etc. In addition, MARTA has been aggressively implementing the rapid rail transit plan.

The present operating system includes 1,500 route miles of bus service, 32 miles of rapid rail lines and 29 passenger stations. Average weekday ridership equals approximately 495,000 trips. Annually, MARTA provides 45.5 million vehicle miles of bus and rail service to the citizens of the Atlanta Region. One hundred and fifty million passengers board the combined system annually and ridership increased by 3.5% during FY1990.

TRANSPORTATION INFRASTRUCTURE AND SERVICE

As with other forms of infrastructure, MARTA supports the needs of the community and strives to provide excellence in transportation service to all of our patrons. MARTA has integrated bus, rapid rail and special service vans to provide appropriate levels of service throughout its service area.

Service on the Bus System

MARTA became operational with the purchase of the Atlanta Transit System's buses and facilities in 1972. Since then the bus system has been critical in providing direct transit service for patrons throughout the Metropolitan Atlanta area as well as providing feeder bus service for the rail line as it has developed.

Our buses operate 30.0 million miles annually. There are 681 buses in MARTA's active bus fleet not including the 36 buses operating under contract to he Authority. There are 150 bus routes which together form an operating system of 1,543 route miles.

MARTA's safety record is unsurpassed by any other transit authority. In fact, MARTA has been declared the safest transit system in the United States eleven times and the safest in the North American continent four times in the past fifteen years.

Service on the Rail System

As approved by the voters in 1971 and as subsequently amended, the MARTA Rail Plan calls for 60 miles of heavy rail lines, 45 stations and 33,000 parking spaces. The proposed network includes two main trunk lines that intersect in the Atlanta Central Business District; four rail branches; one feeder rail line; and one busway (See Attachment #1).

MARTA has been building the rail system in phases, giving priority to those phases which promise the greatest return on investment or which are given priority for reasons of construction staging or operating efficiencies. MARTA has in service 32 miles of track, 29 stations and 17,000 parking spaces. All of Phases A and B (See Attachment #1) are in service as well as all of Phase C except the extension from Chamblee to Doraville.

MARTA has under development at the present time twelve miles of track and six stations. This includes the last part of Phase C -- two miles of track and the Doraville Station. This portion is 40% complete and is scheduled to open in December 1992.

The remainder of the MARTA System that is currently under development is Phase D which consists of ten miles of track and five stations. It includes three lines: 1) extension of the East Line from Avondale through Kensington to Indian Creek -- three miles of track and two stations; 2) construction of a branch feeder line in the Proctor Creek Corridor -- between the Ashby Street Station and Bankhead Highway -- one mile of track and one station; and 3) the North Line from Lindbergh Station to the Medical Center -- six miles of track and two stations. All of Phase D is under development -- detail design, land acquisition as well as construction. Revenue service to Bankhead is scheduled to begin in mid-1992; to Kensington and Indian Creek in mid-1993; and to Buckhead and the Medical Center in mid-1995.

The total current estimated cost of Phase D is $449.9 million, of which the Urban Mass Transportation Administration (UMTA) is providing $135 million or 34%. All federal funds are being applied to the East Line extension from Avondale to Indian Creek. The feeder line in the Proctor Creek corridor and the North Line to Medical Center are being built with local funds.

When Phase D is completed in the mid-90's, MARTA's rail operating system will consist of 44 miles of track and 35 stations. UMTA is providing $1.5 billion or 53% of the $2.9 billion cost. The local share is $1.4 billion or 47% of the cost.

Service to the Elderly and Handicapped

MARTA has a long history of service to our patrons with special needs, our elderly and handicapped citizens. In 1976, the Elderly and Handicapped Committee was created and MARTA's commitment to providing lift buses and special services to this group of patrons was formalized.

Two years before the Americans with Disabilities Act was signed, MARTA - working with its E & H Committee - formulated and adopted the policy that 50% of the bus fleet would be fully accessible to the elderly and handicapped by 1992 and that 100% accessibility would be achieved by the year 2000. The rail system including all of the rail passenger stations are already completely accessible to these special patrons. Additionally, MARTA has contracted with a private company to provide limited scheduled and demand responsive lift van service for those special patrons who cannot avail themselves of the regularly scheduled transit operations.

Service through Intermodal Linkage

Service to our patrons is also enhanced by maximizing opportunities for intermodal linkages and interfacing with other systems. The system is designed to facilitate transfer between MARTA's bus and rail components.

An intermodal link also exists between intercity bus and the rapid rail system. The Greyhound Bus Terminal is within easy walking distance to MARTA. Plans are underway to improve this linkage by building a new terminal in conjunction with a MARTA rail station.

Undoubtedly MARTA's most successful intermodal linkage is represented by our airport rail station which is in the heart of the baggage/ground transportation area of Hartsfield International Airport.

When the Airport Rail Station opened in the summer of 1988, the average weekday patronage was 7,300. This station has seen a steady increase in patronage. In June 1990, average weekday patronage was 9,500 which is a 30% increase since the opening of the station.

Part of the airport station ridership increase comes from travelers residing outside of Georgia. Thus MARTA has become an intermodal extension to the Atlanta airport as it brings business people and tourists into the State of Georgia.

Service through Interface with Other Systems

In July 1989, MARTA entered into a reciprocal free transfer arrangement and cooperative operating plan with the new Cobb Community Transit (CCT) system. Under this agreement, individuals are allowed free transfers between MARTA and CCT services, and operating procedures were implemented for enhanced customer convenience.

The transit ridership level and regional mobility have clearly benefited from this agreement. CCT ridership has exceeded all expectations with the system's greatest usage route being on CCT local Route 10, connecting the City of Marietta and Cobb County's densely developed Cumberland/Galleria area with the MARTA Arts Center Station. Individuals travelling from Cobb County into the MARTA service area and vice versa have been well served by this connection as demonstrated by CCT Route 10 where 43.5

percent of the riders are Fulton and DeKalb residents travelling to destinations in Cobb County.

Transit Service and its Direct Benefits to the Economy and the Environment

MARTA's mission statement, A Standard of Excellence, has as one of its by products the attraction of riders to the transit system. Our striving for excellence not only benefits the regional economy but also has immediate positive impacts on the regional environment.

Many direct economic benefits accrue to the region as a result of MARTA's activities. MARTA employs more than 3,300 people full time and almost 500 part-time workers. The multiplier effect of the rail construction dollar is 3.5 times the direct investment which means that the $2.8 billion spent for rail development programs has contributed about $9.8 billion to the region's economy.

As growth and expansion continue, traffic congestion has become endemic to certain part of Metropolitan Atlanta. This local experience contributes to the fulfilling of the U. S. Department of Transportation projection that more than 7 billion gallons of fuel will be wasted because of traffic congestion by the year 2005.

Traffic congestion adds to the region's problem with air pollution. Motor vehicles contribute 40% - 60% of the hydrocarbons that produce our ozone and smog problem, and cause 70% - 80% of our carbon monoxide emissions. It is estimated that one person using mass transit for a year instead of driving to work saves our environment 9.1 pounds of hydrocarbons, 62.5 pounds of carbon monoxide and 4.9 pounds of nitrogen oxides.

In return for the region's support for MARTA, the Authority offers an alternative transportation mode which is energy efficient, reduces traffic congestion, and has a positive impact on the environment. Every bus full of passengers at rush hour removes 55 cars from our congested highways and every rail car removes 125 cars from traffic.

THE FUTURE OF TRANSIT IN THE ATLANTA REGION

MARTA stands on a record of successes in the provision of transit infrastructure to the citizens of our community. We are proud of the transit system being built in the Atlanta region and thankful for the community support and vision that established a dedicated source of local funds to support it. The service that MARTA has been able to provide to the citizens of Atlanta area as represented primarily in the 4th and 5th Congressional districts has been made possible by the strong local - federal partnership that the members of this committee have sustained. Continued federal financial support for alternative modes of transportation and sensitivity to the impact of federal mandates on local transit systems is vital to the future of transit in the Atlanta region.

As we approach our immediate future, MARTA's first priority and need is to complete the 60 mile rail system approved in the original 1971 referendum and subsequently amended. As we pursue this goal, we must also assess developments within the region to identify new corridors where mass transit is justified and needed. One of these corridors is the North Atlanta Corridor.

Extension of the North Rail Line

Congressional support has already been forthcoming for MARTA's North Line Extension which is needed to link the transit system currently serving the Atlanta region with the North Atlanta Corridor.

The Metropolitan Atlanta Region is one of the most robust urban areas in the United States. The current population is 2.2 million, up from 1.8 million in 1980; employment is 1.2 million, up from 881,000 in 1980. In 2010, the region's population will reach 3.7 million and employment 2.4 million.

The North Atlanta Corridor is the fastest growing corridor in the region. Property that was developed commercially ten to fifteen years ago is now being redeveloped to higher densities (See Attachment #2).

The 1980 Census reported a population of 147,619 for the North Atlanta Corridor, or eight percent of the seven-county region's total. Since 1980, the area has experienced a 61% increase in population to 237,000. Employment has increased 119%, from 53,059 to 116,500. By the year 2010, population in the corridor will be 431,000; employment will be 270,000.

The central portion of the corridor is becoming a dense urban center which will soon rival downtown Atlanta. Sixteen million square feet of commercial space exist now or are under development in the central portion of the corridor. Just north of the core another 30 million square feet of space exist or will be developed. This accelerated growth has resulted in significant traffic congestion and delays. At the same time, there is an increasing demand for public transportation to transport workers from the central city to jobs in the corridor.

Thus the MARTA North Line is the next logical phase of MARTA development. The line (See Attachment #1) branches off the Northeast Line in the vicinity of Lenox Square, one of the largest regional shopping centers in the metropolitan area. Two stations and 5.7 miles of heavy rail will be built in conjunction with a major highway improvement (GA 400). The rail line from Buckhead to Medical Center, estimated to cost $230 million, will be fully financed with local funds. Construction is already underway.

Extending public transit improvements further into the North Atlanta Corridor is considered by Atlanta region officials to be a matter of top priority. It is a corridor of rapidly expanding job opportunities with major arterials and feeder streets operating at, or above, theoretical capacity levels. Moreover, public transportation improvements are needed in order to adequately serve patrons who have no other means of travelling to and from this job-rich corridor.

The Draft Environmental Impact Statement has been submitted to UMTA and MARTA is anticipating approval for preliminary engineering work in late August.

The current estimated cost of the project -- Medical Center to North Springs -- is $499.9 million. This estimate does not include the cost of preliminary engineering but does include funds to purchase additional rail vehicles.

MARTA expects to request a federal financial commitment to the project of $374.9 million including $52.5 million earmarked last year by congress. While this represents 75% of the cost of the extension, it represents only 53% of the cost of the total 8.8 mile, five station North Line.

The addition of the North Line to the MARTA Rail System will provide substantial benefits in terms of increased ridership, especially reverse commuting from areas of high unemployment in the central city to job-rich suburban employment centers. In addition, further reductions in per passenger operating costs are expected along with improved travel time savings and positive impacts on commercial and retail development.

Other Corridor Possibilities for Future Growth

Development and growth within the region has shown other corridors to be prime candidates for future transit service. In 1989, the Atlanta Regional Commission (ARC) completed a study of potential new transit corridors to serve the growing metropolitan Atlanta suburban market. One of the corridors recommended for further study was the I-285 corridor from the current East Rail Line extending northward, parallel to the freeway, to the North Rail Line in the Perimeter Center area. This cross regional line would serve well in attracting new riders from central, south and east DeKalb to areas like Northlake and Perimeter, and would also feed existing radial lines to downtown, Lenox and the airport.

The design features, patronage and cost results of the ARC study are now being subjected to a more detailed analysis by the MARTA staff. The ARC study also recommended that other corridors including some which are currently outside the MARTA service area be considered for their rail transit potential. They are the Perimeter Center to Cumberland Mall Corridor, the Marietta to Arts Center Corridor in downtown Atlanta, and the I-85 Corridor northeast of Atlanta. Refinements to these corridor studies are being coordinated between ARC and MARTA.

Commuter Rail Service Possibilities

One possible future use of MARTA is as the central distributor in the urbanized area for an Atlanta regional commuter rail system. MARTA's rail transit network in Atlanta and Atlanta's unique geographical and historical position in the region make such a merger of rail services particularly appealing.

Atlanta is the transportation hub of the southeast. Eleven rail lines radiate from the central city into the suburbs (See Attachment #3). Preliminary studies indicate that two transfer terminals (probably near Five Points

Station and Lindbergh Station) would be necessary to join the rapid rail system to the commuter rail system. For commuter rail, MARTA would thus become the distributor. Each service would enhance the other with the whole becoming greater that the parts.

There is some feeling that further widening of the Atlanta freeway system is impractical. Commuter rail doing what it does best - that is, moving lots of people during rush hour - will possibly save our freeway system from early obsolescence. More importantly, commuter rail would help guide future growth, mitigate the problems of urban sprawl and provide a great opportunity to tie 34 counties and a population of 3 - 4 million into a regional whole.

Indications are that a new-start commuter rail service with the right mix of modern equipment, simplified fare structure and the MARTA distributor would be a cost effective approach to regional transportation. The tracks are already there and it makes sense to use them.

As Metropolitan Atlanta grows, we need to reach out into the extremities of the region using existing rail corridors, trackage and rights-of-way and tie those areas into MARTA as a regional transit system.

Increased Costs of the ADA

Congress has passed and the President signed the Americans with Disabilities Act, a landmark civil rights act for our disabled citizens. Although we applaud the equity expressed within this legislation, as a representative of a public transit agency, we must ask: Where are the funds to implement this legislation? Its requirements are tied to the provision of service and without additional government support the cost of this service may add a restraining burden on public transit systems such as MARTA. We feel our responsibilities to this special group of patrons keenly, but the regulations that will be forthcoming on the service levels mandated in the ADA may require greater financial resources at a time when most transit systems have increasingly fewer resources.

Increased Cost of the Clean Air Act

A similar situation exists for transit in regards to the Clean Air Act which is presently before a Congressional

Conference Committee. As earlier stated, transit is beneficial to the environment and MARTA supports the efforts of government to insure clean air for citizens in nonattainment areas such as the Atlanta region. However, it is critical that efforts to regulate the emission standards in our urban bus fleets not be counter productive.

When emission standards and alternative fuel definitions are mandated, the costs of such mandates must be carefully weighed. Mandates that result in increased costs to transit systems will drive up fares or require reductions in service that will make mass transit less attractive. This will increase the numbers of vehicles on the road and aggravate the ozone problem in the Metropolitan Atlanta area. Of the harmful pollutants being emitted in the Atlanta area, 63% of the nitrogen oxides and 70% of the man-made organics come from vehicles. Traffic congestion adds to the problem because emissions from an idling vehicle are worse than from a moving vehicle.

MARTA encourages the House in the setting of emission standards and not in mandating a technology-specific approach to such standards. Specifically, the definition of clean fuel should allow for the use of clean diesel buses and an equitable phase-in schedule should be assessed to minimize the costs to urban transit providers.

Concerns with Reauthorization

The final concern to be brought to this committee is one that deals with the Reauthorization Act. A level playing field was established through the Surface Transportation Assistance Act of 1982 (STAA) which established the federal government's role in the area of public transit. The STAA did two things to establish a level playing field:

1. provided that 1 cent of the federal motor fuel tax be dedicated to transit and thereby ended the vastly unequal competition for funds between transit and the highway interests; and

2. established that Section 3 discretionary funds be apportioned on the 40-40-10-10 percentage basis. Forty percent going to meet the needs of the eight older cities for rail modernization, 40% to the 12 - 15 new start cities for capital construction, 10% to the bus

systems for major bus improvements, and 10% for discretionary allocation to the other three categories.

This level playing field has worked well for MARTA and the Atlanta region's transit needs. While some minor adjustments in the reauthorization may prove necessary, major changes should be made sparingly.

As the reauthorization process proceeds, MARTA would be grateful to the Committee if it would accept additional written material pertaining to the effect of the Reauthorization Bill on transit in the Atlanta region.

CLOSING

MARTA with its buses and rail system is a vital resource to the economic and physical well-being of the Atlanta region. Rapid transit is an important element of the area's transportation infrastructure.

I appreciate the opportunity to present the views of the Authority to this distinguished committee and in closing I want to thank you for all that you have done for MARTA over the years. In no small measure it is as a result of your continuing efforts on our behalf that Atlanta has become a city whose transit infrastructure is capable of moving 150 million passengers annually and handling the transit demands of a major national political party convention, a superbowl, and, possibly, an international Olympic games. I thank you.

Possible Commuter Rail Corridors

A TESTIMONY BEFORE THE COMMITTEE ON PUBLIC WORKS
AND TRANSPORTATION
OF THE U.S. HOUSE OF REPRESENTATIVES

SUBJECT: INFRASTRUCTURE NEEDS OF THE 5TH CONGRESSIONAL DISTRICT OF GEORGIA

PRESENTED TO: CONGRESSMAN JOHN LEWIS

PRESENTED BY: BRAD HUBBERT

TOPIC: MBE, DBE AND WBE FEDERAL PROGRAMS

THERE ARE SEVERAL POINTS WHICH NEED TO BE DISCUSSED:

1. *JUSTIFICATION AND PURPOSE OF THE PROGRAM - DO WE IN THE UNITED STATES NEED A DBE PROGRAM?*
2. *THE STRUCTURE OF THE PROGRAM*
3. *PROCESS AND CRITERIA FOR QUALIFICATION/CERTIFICATION FOR PARTICIPATION IN THE PROGRAM*
4. *EVALUATION AND MONITORING OF THE PROGRAM*
5. *POLICY ESTABLISHING ADMINISTRATIVE INCENTIVES*
6. *PENALTIES FOR MISUSE AND ABUSE OF BOTH FUNDS AND PROGRAM*
    - *A. FOR STATES*
    - *B. FOR PRIME CONTRACTORS*
    - *C. FOR PROGRAM CONTRACTORS*

MR. CHAIRMAN AND COMMITTEE MEMBERS, I AM INDEED DELIGHTED TO HAVE SUCH AN OPPORTUNITY TO TESTIFY ON AN ISSUE I VIEW AS A TREMENDOUS CHALLENGE. I AM ALSO SADDENED THAT WE HAVE SO LITTLE TIME TO SHARE SO MUCH INFORMATION: INFORMATION THAT COULD SET POLICIES FOR MANY YEARS AND EVEN DECADES WHICH COULD AFFECT SO MANY LIVES.

I. JUSTIFICATION AND PURPOSE

THIS IS A MUCH NEEDED AND VERY WORTHWHILE PROGRAM IF:

1. THERE IS TRULY A SINCERE COMMITMENT TO THE PROGRAM'S SUCCESS.

2. THE COMMITMENT IS DEMONSTRATED IN SEVERAL WAYS:

    a. THE APPROPRIATION OF SUBSTANTIAL AND ADEQUATE FINANCIAL RESOURCES,

    b. THE STRUCTURE OF THE PROGRAM,

    c. THE PERCENTAGE GOALS

    d. THE DESIGN OF THE CERTIFICATION PROCESS

    e. THE DESIGN OF THE EVALUATION AND MONITORING PROCESS

    f. THE SYSTEM FOR REWARDS AND/OR PENALTIES FOR ABUSE OF OR MISUSE OF FUNDS IN THE PROGRAM.

I AM OF THE OPINION THAT SUCH A PROGRAM IS CRITICALLY IMPORTANT AND THAT LITTLE OR NO ACTION ON IT WILL LEAD TO PHYSICAL CONFRONTATION IN THE FUTURE.

SOME PLACE, BURIED DEEP IN OUR COUNTRY'S CONSTITUTION, IS THE STATEMENT THAT ALL CITIZENS SHOULD HAVE EQUAL ACCESS TO LIFE, LIBERTY, AND THE PURSUIT OF HAPPINESS, WHICH, CLEARLY INCLUDES

EQUAL ACCESS TO ECONOMIC OPPORTUNITY. IT IS IMPERATIVE THAT OUR LEADERS REALIZE THAT A SERIOUS EFFORT MUST BE MADE TO NARROW THE GAP BETWEEN THE "HAVES" AND THE "HAVE-NOTS" DESIRING TO WORK WITH INTEGRITY IN A JUST ECONOMIC SYSTEM.

IN MY DISCUSSIONS WITH VARIOUS ENTITIES IN THE CONSTRUCTION INDUSTRY, FREQUENTLY THE STATEMENT IS MADE THAT "IF THERE WASN'T A FEDERAL DBE PROGRAM, WE WOULD NOT BE USING ANY MBE FIRMS." I BELIEVE THAT THIS STATEMENT IS A TRUE REFLECTION OF THE GENUINE SENTIMENT THAT PROPOSES TO OMIT THE TREMENDOUS CAPABILITY RESIDENTS IN THE MINORITY COMMUNITY. IF YOU TAKE A LOOK AT ALL OF GEORGIA'S STATE HIGHWAY CONSTRUCTION PROJECTS WHERE THERE ARE NO FEDERAL DOLLARS BEING USED; THERE IS NO FEDERAL GOAL, AND IN THE ABSENCE OF A MANDATED GOAL, RATHER THAN ESTABLISH A GOAL REPRESENTATIVE OF THE STATE'S POPULATION, THE LOCAL GOAL IS ZERO, AND THERE ARE NO DBE'S BEING USED IN AT LEAST 98% OF THE PROJECTS.

SOMETHING IS SERIOUSLY WRONG WITH OUR NATIONAL PRIORITIES WHEN WE CAN SPEND BILLIONS AND BILLIONS OF DOLLARS AND ALLOCATE SOME OF THE BEST MINDS TO THE SPACE PROGRAM, AND STILL HAVE MAJOR

MISTAKES, SUCH AS THAT OF THE HUBBLE TELESCOPE, AND YET CANNOT SPEND ONE BILLION ON 30% OF OUR POPULATION TO MAKE SURE THAT THEY HAVE EQUAL ACCESS TO ECONOMIC OPPORTUNITY IN THIS COUNTRY.

I AM OF THE OPINION THAT A SOUNDLY FUNDED AND ADMINISTERED DBE PROGRAM WOULD GREATLY ENHANCE THE SIZE OF OUR TAX DIGEST AND SIGNIFICANTLY REDUCE OUR TAX BURDEN. MORE IMPORTANTLY, IT WOULD GIVE EACH PARTICIPATING DBE A SENSE OF MEANINGFUL PARTICIPATION IN OUR NATION'S ECONOMY—AND THIS IS A POWERFUL MESSAGE. DBE'S IN GEORGIA SHARE THIS DESIRE WITH PEOPLE AROUND THE WORLD—WHETHER EAST BERLIN OR CZECHOSLOVAKIA. RECENTLY MAJOR SHIFTS IN GOVERNMENTS THROUGHOUT THE WORLD HAVE SHOWN US THAT THE AVERAGE CITIZEN WANTS TO BE GOVERNED UNDER A DEMOCRATIC PROCESS—WHICH MEANS A GOVERNMENT RUN FOR THE PEOPLE AND BY THE PEOPLE.

THE GLOBAL CHALLENGE OF THE FUTURE AS I SEE IT WILL BE TO DETERMINE WHICH COUNTRIES WILL SUCCESSFULLY INTRODUCE THE MOST PRODUCTIVE AND BALANCED DEMOCRATIC PARTICIPATION FOR ALL OF ITS ETHINIC

MINORITIES---WHICH COUNTRIES WILL HAVE THE LARGEST NUMBER OF CITIZENS BEING TRULY PRODUCTIVE, FEELING THAT THEY ARE TRULY IMPORTANT, BECAUSE THEY ARE MAKING A SIGNIFICANT CONTRIBUTION TO SOCIETY.

II. STRUCTURE OF THE PROGRAM

THE PROGRAM SHOULD CONTAIN THREE SECTIONS, TO ENSURE THAT IT IS COMPLETE AND COMPREHENSIVE.

A. SECTION I: MINORITY BUSINESS ENTERPRISE - THE PARTICIPATION GOAL SHOULD BE A MINIMUM OF TWELVE PERCENT (12%).

B. SECTION II: WOMENS' BUSINESS ENTERPRISE - THE GOAL SHOULD BE A MINIMUM OF EIGHT PERCENT (8%).

C. SECTION III: DISADVANTAGED BUSINESS ENTERPRISE - THE GOAL SHOULD BE SET AT FIVE PERCENT (5%).

UNDER EACH SECTION THERE SHOULD BE STRICT GUIDELINES FOR QUALIFYING. THERE ALSO SHOULD BE CONSISTENT INTERPRETATIONS OF WHAT CONSTITUTES A PERSON BEING ELIGIBLE FOR THESE CLASSIFICATIONS.

BONDING

THERE SHOULD BE A WELL DEFINED BOND ASSISTANCE PROGRAM IN PLACE TO HELP THOSE PERSONS IN THE DBE PROGRAM WHO ARE SUCCESSFUL CONTRACT AWARDEES.

OPERATING CAPITAL

THERE SHOULD BE A WELL DESIGNED PROGRAM TO PROVIDE SHORT TERM LOANS AND LINES OF CREDIT.

MINORITY CONTRACTORS, FOR THE MOST PART, CANNOT FIND OR DO NOT HAVE ACCESS TO SUFFICIENT OPERATING CAPITAL. FURTHERMORE, IF THEY ARE SUCCESSFUL IN FINDING CAPITAL, IT IS FREQUENTLY SO EXPENSIVE THAT INTEREST COSTS CONSUME ALL PROFITS BY THE END OF THE CONTRACT.

IN ADDITION, MOST OF THESE CONTRACTORS ARE IN A SUB-CONTRACTING POSITION, OR EVEN A SUB-SUB-CONTRACTING ARRANGEMENT WHICH PREVENTS MOST LENDING INSTITUTIONS FROM EXTENDING CREDIT ON THE CONTRACT.

IN MANY CASES, THE PRIME CONTRACTOR WILL HOLD THE SUBCONTRACTOR'S MONEY EVEN AFTER THE PRIME HAS BEEN PAID, AND AFTER THE SUBCONTRACTOR HAS SUCCESSFULLY COMPLETED THE PROJECT.

THEREFORE, IF WE ARE SERIOUS ABOUT A PROGRAM, WE NEED A PROGRAM THAT INCLUDES ALL COMPONENTS NECESSARY TO ADDRESS AND REMEDY THE ABOVE CONCERNS. A HEALTHY, FUNCTIONING BUSINESS IS SIMILAR TO A HUMAN BEING---IT CONSISTS OF THREE MAJOR COMPONENTS: THE INSPIRED AND THINKING BRAIN, THE WORKING AND PRODUCTIVE PHYSICAL BODY, AND THE SPIRITUAL SOUL. IN BUSINESS WE NEED THE INSPIRATION AND MOTIVATION PROVIDED BY A DYNAMIC ACCESS TO ECONOMIC OPPORTUNITIES (SIMILAR TO THE BRAIN), THE ACCESS TO CAPITAL WHICH PROVIDES THE WHEREWITHALL TO BE PRODUCTIVE (THE BODY), AND THE ACCESS TO BONDING WHICH GUARANTEES INTEGRITY, (THE SOUL).

IN THE PAST, WE HAVE BEEN SUPPLIED PIECEMEAL WITH THESE VARIOUS COMPONENTS, WITH ONE OR MORE FREQUENTLY MISSING OR POORLY DEVELOPED. WE MUST COMMIT TO MAKING THE PROGRAM ROBUST AND HEALTHY BY PROVIDING ALL THREE AT ONE TIME.

III. PROCESS AND CRITERIA FOR QUALIFICATION AND CERTIFICATION

THERE SHOULD BE VERY DEFINITE AND SPECIFIC GUIDELINES FOR PARTICIPATION IN THE PROGRAM, THESE GUIDELINES SHOULD FOLLOW THE DEFINITIONS OF MBE, WBE, AND DBE BEFORE BEING CERTIFIED WITH DOT:

A. A COMPANY SHOULD BE IN BUSINESS FOR A MINIMUM OF ONE YEAR.

B. A COMPANY SHOULD HAVE PERFORMED A MINIMUM OF $50,000 OF CONSTRUCTION WORK IN THE MOST RECENT CALENDAR YEAR OR A COMBINED AGGREGATE OF $50,000 IN CONSTRUCTION WORK IN THE PAST TWO YEARS.

C. DAY-TO-DAY OPERATION—THE HEAD OF THE COMPANY MUST DEMONSTRATE GENUINE AND MEANINGFUL PARTICIPATION ON A DAY-TO-DAY BASIS. THE PERSON MUST BE EVALUATED ON A DAY-TO-DAY BASIS. THEY MUST HAVE A THOROUGH WORKING KNOWLEDGE OF THE ENTIRE OPERATION. THEY MUST BE INVOLVED IN THE DAY-TO-DAY DECISION MAKING PROCESS. THEIR PARTICIPATION CANNOT BE LIMITED TO BEING LISTED AS OWNERS ON STOCK CERTIFICATES AND AS SIGNATORIES ON BANK ACCOUNTS.

THESE STANDARDS SERVE A SPECIFIC PURPOSE—THEY ELIMINATE THE PRACTICE OF ESTABLISHING "FRONT" COMPANIES OVERNIGHT AFTER

CONTRACT AWARD AND BEFORE THE CONTRACT COMMENCES.

IV. EVALUATION AND MONITORING OF THE PROGRAM

A. ON-SITE VISITS

THERE SHOULD BE FREQUENT ON-SITE VISITS ONCE A FIRM HAS BEEN CERTIFIED, TO MAKE SURE THAT THEY ARE IN COMPLIANCE. ONCE A MAJOR CONTRACT (IN THE RANGE OF $1.0 - 1.5 MILLION) HAS BEEN AWARDED TO A PRIME CONTRACTOR, THERE SHOULD BE A MID-PROJECT AUDIT AND A FINAL AUDIT OF BOTH THE CORPORATION AND THE OWNER(S) OF THE CORPORATION. THIS SHOULD BE DONE AT THE EXPENSE OF THE CORPORATION TO ENSURE THAT FUNDS FOR LEGITIMATE MINORITY PARTICIPATION INDEED WERE DISBURSED TO THAT END AND WENT WHERE THEY WERE SUPPOSED TO GO—TO LEGITIMATELY QUALIFYING RECIPIENTS.

PERSONNEL REVIEW

THERE SHOULD BE ON-GOING REVIEWS OF PERSONNEL AND PERSONNEL RECORDS DOCUMENTING INDIVIDUALS PERFORMING ON THE JOB. THERE SHOULD ALSO BE A TRACKING SYSTEM IN PLACE TO SEE IF A PERSON MOVES

FROM PRIME TO MBE AND BACK TO PRIME, OR IF HE MOVES ON WITH THE MBE FIRM.

V. POLICY ESTABLISHING ADMINISTRATIVE INCENTIVES

A. FOR STATES

B. FOR ADMINISTERING AGENCIES

THERE MUST BE MOTIVATION FOR A STATE OR A STATE'S ADMINISTRATORS TO MAKE A SINCERE EFFORT TO ESTABLISH A WELL FOUNDED MBE, WBE, DBE PROGRAM. WHATEVER TYPE IS PUT IN PLACE, IT MUST BE ENFORCEABLE AND ENFORCED.

FIRST, THE PROGRAM SHOULD BE A DUAL NATURE—MEANING THAT THERE SHOULD BE BOTH REWARDS AND PUNISHMENT.

WITH STATE FUNDS ALLOCATION, THIS MEANS THAT STATE APPROPRIATIONS SHOULD BE DESIGNED SO THAT ALL PARTIES STAND TO BENEFIT IF THE PROGRAM IS A SUCCESS--FIRST THE MBE/WBE/DBE, FOLLOWED BY THE STATE'S LEADERS, THE PRIME CONTRACTOR, AND THE CITIZENS OF THAT STATE. IF ALL OF THESE PERSONS STAND TO BENEFIT, WHAT GROUP WOULD HAVE

AN INTEREST IN WORKING AGAINST THE PROGRAM?

SALARY INCENTIVES--SUCCESSIVE SALARY RAISES FOR DEPARTMENT HEADS AND/OR COMMISSIONERS SHOULD BE ADJUSTED WITH A FACTOR REFLECTING HOW WELL HIS/HER MINORITY PARTICIPATION PROGRAM IS DOING.

VI. PENALTIES FOR MISUSE AND ABUSE OF FUNDS AND PROGRAMS

A. FOR STATES

B. FOR PRIME CONTRACTORS

C. FOR PROGRAM CONTRACTORS

THERE SHOULD BE PENALTIES FOR ANY AND ALL PERSONS WHO MISUSE FUNDS OR THE PROGRAM. PERSONS WHO FALSIFY INFORMATION TO GET INTO THE PROGRAM SHOULD BE FINED. PROGRAM CONTRACTORS WHO QUALIFY BUT PARTICIPATE IN A "PHONY" ORGANIZATION SHOULD BE DISQUALIFIED AND NOT ALLOWED TO PARTICIPATE ON STATE PROJECTS FOR TWO YEARS AFTER COMPLETING THEIR LAST CONTRACT WITH THE STATE. AN OFFENDING PRIME CONTRACTOR SHOULD NOT BE ALLOWED TO PARTICIPATE IN A SIMILAR PROGRAM FOR A MINIMUM OF ONE YEAR

AFTER COMPLETION OF HIS/HER LAST CONTRACT WITH THE STATE. THERE SHOULD ALSO BE PROCEDURES FOR RECOVERY OF FUNDS THAT HAVE BEEN EXPENDED TO THE PHONY ORGANIZATION.

FOCUS

OUR FOCUS IS ON HELPING MBE. THAT'S ONE REASON, BUT THERE ARE SEVERAL BROADER AND MORE IN DEPTH REASONS WHICH ARE:

1. *WE'LL REDUCE THE NUMBER OF PERSONS IN THE UNEMPLOYMENT LINES.*
2. *WE'LL REDUCE THE NUMBER OF PERSONS ON WELFARE.*
3. *WE'LL REDUCE THE NUMBER OF PERSONS INCARCERATED.*
4. *WE'LL PROBABLY REDUCE THE NUMBER OF CRIMES COMMITTED.*
5. *WE'LL TRULY REDISTRIBUTE THE TAX BURDEN.*

A PROGRAM WHICH DELIVERS ALL THESE BENEFITS IS TRULY A PROGRAM WHERE EVERY AMERICAN CITIZEN WOULD BE THE BENEFACTOR.

THESE ARE THE REASONS I FEEL THAT A DBE PROGRAM IS A MUST, NOT LATER, BUT RIGHT NOW.

MR. CHAIRMAN, IN CLOSING, THIS IS MY 2ND SUCH COMMITTEE HEARING THIS YEAR, AND IT REMINDS ME OF A LONE VOICE IN THE WILDERNESS CRYING FOR HELP AND THE ONLY SOUND IS THE ECHO OF HIS CALL. WE ARE HOPEFUL THAT SOME SERIOUS ACTION WILL BE TAKEN.

CHAIRMAN LOMAX'S BRIEFING PAPER
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
REGIONAL HEARING: FUTURE U.S. INFRASTRUCTURE NEEDS
WEDNESDAY, AUGUST 8, 1990 -- 9 A.M.
ATLANTA CITY HALL COUNCIL CHAMBERS

-- I WANT TO SAY TO THE DISTINGUISHED MEMBERS OF THIS COMMITTEE THAT YOUR HEARING COULD NOT HAVE COME AT A MORE TIMELY OR CRITICAL MOMENT FOR US. THIS REGION'S GROWTH WILL BE STOPPED DEAD IN ITS TRACKS UNLESS IT HAS ADEQUATE WATER RESOURCES TO ACCOMMODATE THE RESIDENTIAL AND BUSINESS POPULATION MIGRATION WE ARE EXPECTING OVER THE NEXT TWO DECADES. THE ATLANTA REGIONAL COMMISSION HAS ESTIMATED THAT METRO ATLANTA

WILL NEED 40% MORE WATER THAN IT NOW GENERATES IN ORDER TO SATISFY THOSE GROWTH PROJECTIONS.

NOW, HOWEVER, WE FACE A LEGAL WHIPSAWING ACTION FROM TWO OF OUR NEIGHBORING STATES WHICH, IF SUCCESSFUL, WOULD MAKE THIS A STAGNANT, NO-GROWTH METROPOLIS. WE HAVE MADE A MORE THAN REASONABLE REQUEST THAT A GREATER PERCENTAGE OF THE

CHATTAHOOCHEE BE RE-ALLOCATED AWAY FROM POWER GENERATION AND RECREATION INTO CLEAN WATER SUPPLY FOR OUR MOST BASIC HEALTH AND SAFETY NEEDS. THE RIVER IS PRIMARILY A RESOURCE FOR GEORGIA, AND WE DESERVE TO BE ABLE TO TAP INTO IT FOR OUR LEGITIMATE REQUIREMENTS. I AM MAKING AN URGENT PLEA TO THIS COMMITTEE TO SUPPORT US IN THIS STRUGGLE, WHICH WE DID NOT INSTIGATE AND DO NOT WELCOME.

THIS SUMMER'S WATER-DISTRIBUTION CRISIS PERFECTLY UNDERSCORES MY POINT. FULTON COUNTY IS DOING ITS PART TO EASE THE PRESSURE, WITH THE CONSTRUCTION OF WATER-LOOP AND WATER TREATMENT PLANTS IN NORTH FULTON. RIGHT NOW, OUR PUBLIC WORKS DEPARTMENT IS FINISHING AN ANALYSIS OF OUR WATER RATE STRUCTURE WHICH WILL LEAD US TO REFORM OUR WATER PRICING POLICIES SO THAT WE DO NOT PENALIZE CONSERVATION AND

REWARD PROFLIGACY. NOW, IT'S YOUR TURN TO SUPPLEMENT OUR OWN GOOD-FAITH ACTIONS WITH YOUR ENDORSEMENT OF OUR POSITION. NOTHING LESS THAN OUR FUTURE IS AT STAKE.

THERE'S ALSO A CRYING NEED, HERE AND ALL OVER THE NATION, FOR THE TECHNOLOGICAL BREAKTHROUGHS THAT WILL GIVE US AFFORDABLE OPTIONS TO LANDFILLING. EVERY DAY, WE ARE HAVING GARBAGE TRUCKED TO SOUTH GEORGIA BECAUSE THE MEGAGROWTH AREA OF OUR COUNTY WOULD NOT ALLOW US TO DEVELOP A DESPERATELY-NEEDED REPLACEMENT LANDFILL. AT PRESENT, HOWEVER, THERE ARE NO ALTERNATIVES -- INCLUDING INCINERATION -- WHICH DON'T REQUIRE SOME MEASURE OF LANDFILLING AND/OR POSE A HEALTH RISK OF SOME SORT.

IT IS IMPERATIVE, THEN, THAT RESEARCH FUNDS AND A COMMITMENT TO THAT RESEARCH BE MADE ON THE FEDERAL LEVEL SO THAT NEW, LESS EXPENSIVE METHODS OF SOLID WASTE MANAGEMENT AND DISPOSAL ARE AVAILABLE TO US. AGAIN,, FULTON COUNTY IS DOING ITS PART TO BE A RESPONSIBLE PUBLIC CITIZEN. WE ARE CURRENTLY DEVELOPING A COMPREHENSIVE SOLID WASTE MANAGEMENT PROGRAM WHICH WILL PLACE HEAVY EMPHASIS UPON

RECYCLING. IN-HOUSE, WE IMPLEMENTED A PAPER RECYCLING OPERATION THAT IS THE FIRST OF ITS KIND AMONG COUNTY GOVERNMENTS IN THE U.S. AND WE HAVE DONATED LAND AND FUNDS TOWARDS PRIVATELY-OPERATED RECYCLING INITIATIVES UP AT MORGAN FALLS. BUT WE CAN'T SOLVE THIS DILEMMA OURSELVES, ANY MORE THAN OTHER LOCAL GOVERNMENTS CAN. WE AS A NATION ARE RUNNING OUT OF SPACE TO DISPOSE OF OUR GARBAGE. THE ENVIRONMENTAL

CONSCIOUSNESS-RAISING GOING ON IN THIS COUNTRY OUGHT TO EXTEND TO WASHINGTON IN THIS REGARD. IF WE CAN DEDICATE OURSELVES TO LAUCHING A MISSION TO ANOTHER PLANET DURING THE NEXT GENERATION, WE CAN CERTAINLY DEDICATE OURSELVES TO KEEPING THIS PLANET FROM BEING INUNDATED WITH WASTE.

WHETHER IT'S WATER, SOLID WASTE DISPOSAL

FACILITIES OR ANYTHING ELSE, WE AND OTHER LARGE URBAN GOVERNMENTS WILL BE HARD PUT TO FUND INFRASTRUCTURE IMPROVEMENTS ON A PURELY SELF-SUFFICIENT BASIS. ON A REGULAR BASIS, INFRASTRUCTURE WILL TAKE UP THE LION'S SHARE OF CAPITAL IMPROVEMENTS SPENDING IN FULTON COUNTY FOR THE 1990-1999 DECADE. PROJECTED CAPITAL PROJECTS IN FULTON WILL COST $1.46 BILLION, OF WHICH WE WILL PAY 70% ($1.02 BILLION), WHILE OTHER

SOURCES, ESPECIALLY OTHER GOVERNMENTS, WOULD PICK UP 30% ($435 MILLION). FOR STREETS AND BRIDGES ALONE, PROJECTED SPENDING FOR 1990-1999 IS $459 MILLION.

WHILE THE COUNTY TAKES IN USER CHARGES TO HELP SUPPORT WATER/SEWER FACILITIES, ITS OTHER FUNDING SOURCES ARE: 1) AN ANNUAL $3-MILLION GENERAL OBLIGATION BOND ISSUE; 2) ACCRUED SAVINGS FROM THE

GENERAL AND SPECIAL SERVICES DISTRICT FUNDS; AND 3) EXCESS CAPACITY OF THE BUILDING AUTHORITY'S $75-MILLION BONDING AUTHORITY AS OUTSTANDING DEBT IS RETIRED. HOWEVER, CAPITAL PROJECT REQUESTS FROM ACCRUED SAVINGS AND GENERAL OBLIGATION BOND FUNDS FOR THE 10-YEAR PERIOD TOTAL $886.5 MILLION, AND THE FUNDS ACTUALLY AVAILABLE FROM THOSE SOURCES DON'T COME CLOSE TO MEETING THE PROJECT DEMAND.

REALISTIC ALTERNATIVES ARE FEW: FIND NEW REVENUE SOURCES; PERSUADE COUNTY VOTERS TO APPROVE A MASSIVE GENERAL OBLIGATION BOND ISSUE TO PAY FOR REPLACING OBSOLETE AND DETERIORATED INFRASTRUCTURE; OR A COMBINATION OF BOTH.

REGIONAL COOPERATION IN AREAS SUCH AS TRANSPORTATION CAN BE HELPFUL, SUCH AS AN INTER-

CONNECTING NETWORK OF SECOND-TIER HIGHWAYS WHICH SPREADS OUT THE TRAFFIC BURDEN AMONG THE CITIES AND COUNTIES WHICH HAVE CREATED IT. ANOTHER SOLUTION, WHICH WOULD PROMOTE RAPID-RAIL TRANSIT -- IS A HIKE IN THE GASOLINE TAX WHICH FEEDS THE FEDERAL HIGHWAY TRUST FUND. MOREOVER, THAT FUND HAS UNFAIRLY BEEN HOARDED TO CAMOUFLAGE THE SIZE OF THE FEDERAL DEFICIT. YET THE MONEY BELONGS TO THE STATES AND

LOCAL GOVERNMENTS.

G.R.I.D. (GRIDLOCK RELIEF FOR INTERSTATES PROGRAM), A LEGISLATIVE PROPOSAL FROM CONGRESSMAN JOHN LEWIS, WOULD ENABLE LOCAL COMMUNITIES TO USE THEIR PORTION OF THE HIGHWAY TRUST FUNDS TO BUY RIGHTS-OF-WAY ALONG INTERSTATE CORRIDORS TO BUILD MASS-TRANSIT FACILITIES AND PARK-AND-RIDE LOTS.

THIS IS MY CONCLUSION: WE HAVE AN ALTERNATIVE REVENUE SOURCES COMMISSION IN PLACE IN FULTON COUNTY TO HELP US FIND NEW MONIES. WE HAVE HAD NO-TAX-HIKE BUDGETS THE LAST TWO YEARS. YET OUR RESPONSIBILITIES AS A LARGE URBAN GOVERNMENT CONTINUE TO GROW -- GRADY HOSPITAL, JAIL, HOMELESSNESS, PUBLIC SAFETY, ETC. -- WHILE STATE AND FEDERAL SUPPORT HAS SHRUNK. THE ONLY WAY WE CAN REBUILD OURSELVES, LITERALLY, IS THROUGH A

FULL PRIVATE/PUBLIC SECTOR PARTNERSHIP ON THE FUNDING, PLANNING AND CONSULTATIVE LEVELS -- SO THAT A COORDINATED POLICY FOR REBUILDING AMERICA EMERGES.

Statement of

John R. Martin

President

National Association of Railroad Passengers

Before the Committee on Public Works and Transportation

U. S. House of Representatives

Infrastructure Needs of the 5th Congressional District of Georgia

August 8, 1990
Atlanta City Council Chambers

Thank you for this opportunity to present the views of our non-profit, consumer-oriented organization, which for 23 years has been promoting "balanced transportation." I am John R. Martin. I have been president of the National Association of Railroad Passengers (NARP) since 1979 and have served on our board of directors since 1975.

The Association's primary goal is improvement and expansion of rail passenger service of all types. We have a special project, the Campaign for New Transportation Priorities, works with other organizations on a broad range of issues including passenger rail, increased federal funding for mass transit in general, and equitable treatment of freight railroads vs. their competitors. "Equitable treatment" means, among other things, trucks and water carriers paying 100% of their infrastructure costs, just as railroads do. (We favor a national weight-distance tax on trucks.)

Attached to my statement is the Campaign's brochure, "A New Transportation Vision," which has been endorsed by the 28 organizations listed in the appendix at the end of this statement.

Scenic America has been one of the most active organizations in the Campaign. On behalf of Scenic America and our own members, we thank you, Mr. Chairman, for introducing H.R. 3389, the Billboard Control Act, last October. This progressive, long-overdue legislation, would restore the billboard-removal process to local control, prohibit new billboards along federal-aid highways, and prohibit "vegetation control" (i.e., cutting of trees on public land to improve billboards' visibility).

ENERGY EFFICIENCY, NATIONAL SECURITY, AND THE ENVIRONMENT

The Iraqi invasion of Kuwait and recent reports that U. S. oil imports now account for 49.9% of our oil consumption remind us of the importance of improving the energy efficiency of our transportation system.

Oak Ridge National Laboratory figures indicate airlines used 1.9 times more energy per passenger-mile than did Amtrak in 1987 (up from 1.8 in 1984); Amtrak would look even better if it had more track that could support speeds above 80 mph. Oak Ridge also says big trucks used 4.3 times more energy per ton-mile than freight trains in 1987 (up from 3.2 in 1984).

The more emphasis we place on the most energy-efficient modes, the less vulnerable we will be to future oil shortages. Also, improved energy-efficiency means a cleaner environment and moves the nation towards attainment of clean air goals.

We are frustrated by President Bush's position that serious action to address global warming should await further study. As the British ambassador to the United Nations noted in a July 29 radio interview, most of the actions that would address global warming make good sense for other reasons as well.

An increased emphasis on public transportation and incentives to use it would insure mobility for all--not just those who have access to cars--an increasingly important consideration as the average age of our population rises. Such an emphasis also would make our transportation system safer and less vulnerable to bad weather. In particular, many parents, aware of the safety records of teen-aged drivers, wish they did not have to give the car keys to their youngsters so often. Since even teen-agers take rail transit more seriously than buses, the more extensive a region's rail network the more often parents can hold on to their keys and "make" the kids use transit.

Mr. Sununu, in ridiculing environmentalists' transportation views, says Americans don't want to be forced out of their cars. We are not suggesting that Americans be forced out of their cars. We ask only that substantial public policy incentives to overuse the private auto be reversed. We think such a reversal would best serve the long-term interests of auto users and present and future transit users.

NEEDED POLICY CHANGES

1. **INTERCITY RAIL PASSENGER:** We support Amtrak President Claytor's suggestion that a penny of the federal gasoline tax be earmarked for Amtrak. We would take that one step further and suggest 2 "railroad" gasoline tax pennies--one to Amtrak for capital investment, the other to serve as federal matching funds for state rail projects, including Amtrak-related projects.

State and local transportation investments are heavily influenced by the availability of federal funds. As one state rail official told our executive director, "the first question they ask when I go to the state capitol is: how many federal dollars will your project get us?" So far, the answer for most railroad projects is "none."

Atlanta could benefit greatly from such a policy, since initiation of the Chicago-Atlanta-Florida service--which the Atlanta Chamber of Commerce and our members are working hard to promote--depends on securing new sources of rail project funding.

Lack of federal matching funds may be a key reason why nothing so far has come of the Georgia Rail Passenger Authority Act, despite the high hopes for new services (such as Atlanta-Savannah) which accompanied its passage. (If Atlanta secures the 1996 Summer Olympics, whose water events would take place in Savannah, the lack of good Atlanta-Savannah train service would be a severe embarrassment to the state.)

2. TRANSIT. There is a vital federal stake in encouraging land-use planning and development patterns compatible with walking, bicycling, and mass transit (especially rail). The relationship between land use and transportation is two-way, of course, and we think rail does the better job of encouraging energy-efficient development patterns. Transit stations should have secure bicycle-parking facilities and be served by good bicycle-trail networks.

We support the American Public Transit Association's call for 7 gasoline-tax cents to be devoted to transit. Presently-available funding falls far shorter of what is needed for rail transit than for highways. In fact, an April 25, 1989, Federal Register notice from UMTA admits that "Federal funding availability will not [even] be sufficient to support all" new rail proposals that meet the administration's own very tight guidelines.

A sophisticated urban center such as Atlanta has diverse transport needs that require the full range of rail transit options including light rail and commuter rail. MARTA's "single-technology" heavy rail system cannot do the job alone. To fully appreciate this, one must look to Boston, Philadelphia, San Francisco, Toronto, and countless overseas cities. Also, the Baltimore and Washington areas are both augmenting their heavy rail lines with light rail (Baltimore's is under construction) and expanded commuter rail.

In Atlanta, some bus corridors (possibly including the route of the #23 Peachtree bus line) would be much better served by light rail, which combines the strong market image shared by all rail transit with the ability of the bus to run on streets and to make frequent stops at inconspicuous stations compatible with the character of residential neighborhoods.

Commuter rail using existing railroad tracks is needed for outlying suburbs. The MARTA/state study of Atlanta-Social Circle and Atlanta-Griffin-Macon 3 years ago focussed on services that would not go to downtown Atlanta but would force passengers to transfer to/from MARTA at outlying stations. (The study ignored at least one other potential commuter rail route worthy of serious review: Atlanta-Marietta-Canton.)

But there is a rough rule-of-thumb that every forced transfer cuts market potential in half. The Northern Virginia commuter rail service expected to begin next year will run through to Washington; projected commuter rail ridership was 8,000/day with through service to Washington vs. 5,400 with a forced transfer in Alexandria to/from WMATA heavy rail trains.

UMTA devotes much of its energy to propagandizing for busways and HOV lanes. We certainly support conversion of existing general-use freeway lanes to transit/carpool priority, and we admit that construction of new restricted lanes would be better than construction of new general-use lanes. But rail would probably do a more effective job in almost every busway corridor of which we are aware. Busways are notoriously ineffective in dealing with off-peak and reverse-peak travel and are vulnerable to constant political pressure to relax the restrictions. Furthermore, the revenue-to-cost ratio of buses on Virginia's Shirley Highway (which UMTA loves to praise) is only 30%.

Rail lines are usually less prone to congestion than bus operations and are more environmentally benign than HOV lanes, as electric trains emit no local air pollution and are quieter and more energy-efficient than diesel buses. Even on-street light rail operations are superior to bus: rail's strong market image enhances ridership here as well, the vehicles have greater capacity than buses (an important advantage in maximizing use of scarce peak-hour road space), and their predictable path of operation enhances traffic safety as compared with buses.

3. CLEAN AIR ACT. Please work for inclusion of the following "VMT-reducing" (vehicle-miles-traveled) provisions in the Clean Air Act conference bill: language from H.R. 3030 requiring the federal government to impose an effective air quality implementation plan when a state fails to do the job; and provisions from S. 1630 that would (a) allow a governor--with approval of the U. S. Secretary of Transportation--to transfer funds from highways to clean transportation projects; (b) require major employers in severe non-attainment areas to increase transit use and ridesharing by their employees; and (c) require transportation plans and projects to conform to state air quality implementation plans and requirements.

4. BOSTON CENTRAL ARTERY/THIRD HARBOR TUNNEL PROJECT is so expensive (almost $5 billion) that all members of Congress should have an interest in seeing that it is "done right." This project now represents one-half "the cost to complete" the nationwide Interstate system. We think inclusion of rail links both to Logan Airport and between Boston's 2 dead-end commuter rail systems should be a prerequisite for the 90% federal funding Massachusetts seeks. The commuter-rail link would also be vital to Amtrak and to New Hampshire and Maine, states that would be forever denied modern, through passenger-train service from points south of Boston if the rail link is not built.

5. THE CHICAGO THIRD AIRPORT study is not considering whether high-speed trains could divert enough short-distance air traffic to render a third airport unnecessary. The consultant is looking at rail only for downtown-new-airport links, saying "our contract is with FAA not FRA."

significantly greater use of the rail mode in the U. S.

Growing numbers of Americans are realizing that more roads and more lane-miles are not the answer to urban transportation problems. Indeed, Los Angeles has built more roads than any other metro area in the world and yet has what is arguably the world's worst transportation system; their brightest hope is the recreation of the rail transit system they destroyed a few decades ago.

So our definition of highway "needs" must be reexamined in light of the growing realization that building highways will not prevent or eliminate gridlock. As he left office, then-Secretary of Transportation James Burnley, in a Jan. 19, 1989, Journal of Commerce interview, attacked the "AASHTO iron triangle's" policy, which he summed up as: "Let's just find more grass to pave as an answer to the problems of the 21st century." Said Burnley, "The country ain't gonna buy it." I agree.

Thank you again for this opportunity to present our views. I will be happy to answer any questions.

TESTIMONY BEFORE THE U.S. HOUSE OF REPRESENTATIVES COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

ATLANTA CITY COUNCIL CHAMBERS; AUGUST 8, 1990
Presented by Sam Massell, President of the Buckhead Coalition, Inc., and
former Mayor of the City of Atlanta

The Buckhead Coalition is a non-profit organization composed of chief executive officers of major firms in the north Atlanta community of Buckhead. Our mission is to foster orderly growth of Buckhead as well as to protect and enhance its quality of life. We believe that access to and through this area and the mobility of our citizens is of utmost importance. Our organization is presently working with the Metropolitan Atlanta Rapid Transit Authority (MARTA) to coordinate the development of its new Buckhead station. We also intend to undertake a feasibility study for constructing a monorail people mover system linking the Buckhead and Lenox MARTA stations with major employment, retail and hotel facilities within Buckhead. In addition, our organization is in the initial stage of organizing for preparation of a long range (20-year) plan for the full 28-square-mile Buckhead area, which will incorporate these transportation issues.

Buckhead has been identified as a suburban downtown. In addition to the 58,000 residents in this community, we have 70,000 jobs, and an estimated daytime population of 115,000 people (including workers, shoppers, hotel guests and medical/dental patients). In the past decade Buckhead has accounted for 40% of all new jobs and 70% of all population and housing growth within the city of Atlanta.

Presently, the commercial area of Buckhead contains approximately nine million-square-feet of offices, four million-square-feet (1,000 stores) of retail, and 4,000 hotel rooms. Well over half of all commercial and office development in Buckhead is less than 10 years old. Land assemblages and multi-use developments already zoned suggest an additional 10 million-square-feet of offices, one million-square-feet of retail, 1,800 hotel rooms, and 2,000 apartment and condominium units over the next decade.

We recognize the absolute necessity of an adequate infrastructure improvement program for the continued growth and livability of expanding urban areas such as Buckhead, and this morning we would like to relate one of these needs, and make a specific request for assistance.

Transportation is a basic infrastructure usually, but not necessarily always, provided by government. In the case of Buckhead, transportation includes both roadways for automobiles, buses and trucks; traditional rail for AMTRAK, and rapid rail for MARTA. At this time, construction is underway on the extension of GA400, a limited access state highway, and the MARTA rapid rail North line. In all likelihood, this will be the last new arterial road constructed in Buckhead for the foreseeable future. While this road will relieve substantial traffic on existing neighborhood surface streets, it serves primarily to bring people into the business center. The major future need will consist of integrating transportation modes and providing internal circulation within the Buckhead high density area.

We believe that a monorail People Mover has the best potential to both improve internal circulation and to integrate transportation modes within Buckhead. The "downtown" core of Buckhead is rapidly achieving urban densities within a wide array of land uses, including office, retail, hotel and multi-family residential development. The density and quantity of development, combined with the ability to integrate auto, bus and rapid rail transit modes gives Buckhead the ability to serve as a national demonstration project, illustrating the use of mass transit technology to achieve suburban mobility and to showcase both a private initiative and a public-private partnership.

In view of the transportation needs and opportunities within the Buckhead commercial core area, we hereby request that this area be considered for a demonstration project. This would consist of a transportation study which would address the following issues:

- Project patronage of a monorail people mover,
- Conduct both concept and preliminary engineering studies,
- Develop a preliminary route and determine right of way needs,
- Develop a phasing plan and cost estimates for each phase,
- Develop a financial plan for payment of both construction and operational costs, and
- Develop a consensus among the affected parties for an equitable formula to support the system financially.

We anticipate that a major portion of the construction and maintenance costs will be borne by owners of commercial property within the people mover corridor. The state enabling legislation for a self imposed special tax district is in place, and our preliminary estimates suggest financing could be achieved with a reasonable office and commercial rental increase of approximately $0.50-$0.60 per square foot per year.

We have reviewed our proposal with the Atlanta Chamber of Commerce and MARTA, with supportive responses from both, and we are pleased to announce the co-sponsorship of this undertaking by the Atlanta Regional Commission, the legally designated transportation planning agency for the Atlanta region.

We estimate the costs of the study to be approximately $150-175,000, and believe that the study can be completed in approximately 10-12 months. We hereby respectfully request that the Committee on Public Works and Transportation request funding for this study, preferably from funds appropriated in the current fiscal year (FY90).

We thank you for this opportunity to address this committee, and will be pleased to provide any additional information you desire.

Mr. Chairman and Members of the Committee:

My name is E.R. Mitchell, Jr., and I am the President of E.R. Mitchell Construction Company. I also serve as President of the Atlanta Chapter of the National Association of Minority Contractors. I am here to tell you about my personal experiences as a black contractor trying to make a living at what I do, and to share with you the broader scope of hurdles black contractors around the country must face each time we attempt to practice business -- barriers we must overcome that stretch beyond the ordinary challenge of submitting a successful bid.

My first experiences in the construction industry were modest. As a young boy my father enlisted my help sweeping out finished houses Saturday mornings starting at 6:30. My father, as he has told you, was diligently attempting to build a construction firm, but like most kids I was generally oblivious to his efforts. I graduated from high school and then attended college at night at Georgia State University in downtown Atlanta while working for our company as an estimator and then a project manager. However, I never intended construction to be my career. My work with my father's company was necessary to finance my education and to contribute to the family. I got my undergraduate degree in business then worked for three years as an underwriter for Allstate Insurance Company.

While I was with Allstate my perspective changed. I let my aspirations take flight. I wanted more, a greater pool of information, a broader world view. I applied to Harvard's MBA program, and I was accepted. I planned a career as an investment banker. Upon graduation, in 1980, my father sat me down and asked me to take over the firm. I realized I loved construction and I wanted to help. I felt confident I could take the company, which was faltering due to my father's health problems, and help the company take off. I was equipped with some outside emblems of success and quality -- my Harvard MBA -- and I was returning to territory I had grown up in -- construction.

One thing I hadn't counted on was racial discrimination. As a young man during the sixties who had succeeded in the larger world outside my community, it took me a long time to acknowledge that the bold facts of 1980 and 1990 were not much different from those of 1965 or 1970.

In 1980 our company's revenues were $150,000. Our estimated revenues for 1989 were $15 million. Ninety percent of our business is with the public sector, including five percent with the City of Atlanta. Ten percent of our work comes from the private sector, and then almost exclusively with minority clients. Less than one-half of one percent of our revenue is derived from majority companies. Even though most of our work comes from government sources, this is not the case industry-wide. In the overall construction market, private sector work is overwhelmingly larger than construction undertaken by the government.

We do business throughout Georgia and to a limited extent in Florida. We only maintain offices in Georgia. We have, however, aggressively sought business in Tennessee, Mississippi, Alabama, and North Carolina.

A good starting point seemed to be Army Corps of Engineers' projects which are extensive in Georgia. I did not know that only a small percent of federal construction dollars would trickle down to minorities under the DOD five pecent goal. Corps' projects were quite doable for E.R. Mitchell Construction and I saw lots of opportunity.

As a certified 8(a) firm in the Small Business Administration's Region IV, we responded to a Corps' RFP. This was an ideal project for us and as we prepared our bid, our excitement grew about possibly winning this award. We felt our chances were excellent since we had specific experience in this area over a long period of time and were capable of meeting the rigorous bonding requirements.

The first inkling of trouble came when the Corps instructed us to ignore the pricing guidelines they had established and mailed to us to help us prepare our bid. We were also told to add extra personnel and different, and expensive, equipment that was not included in the base package. We immediately became concerned that such an exception would not be equitably applied to bidders if the project was removed from 8(a) consideration and bid on the open market. We were unable to meet the Corps' price and the job was bid.

Finally the award was made. We discovered that the majority firm that received the contract had not been required to include the extra personnel and extra, expensive equipment. The Corps held our firm to a more rigid standard than the standards which a majority contractor had to fulfill. We are convinced that subtracting out the steeper costs we were required to add for personnel and equipment, our bid would have been superior.

It is impossible to successfully compete against ANY firm when the rules of the game change and some players are told to adhere to one set of rules, and other players are given more stringent rules. MBE programs provide goal-oriented assurance that the rules of the game will not change.

We have had experiences throughout Georgia which, unfortunately, repeat tenfold this contracting experience. In Albany, Georgia, contract officers have been cordial when we have inquired about 8(a) opportunities, but they remain noncommittal. We have never been called to submit a proposal even though we are, frankly, a strong, minority contractor with an extensive track record.

In Columbus, Georgia, at Fort Benning, government contracting officers generally greet our requests for information regarding contracting opportunities with hostility. Officials refuse to negotiate prices with us under the SBA program. They list an ultimatum price for us to meet, regardless of other substantiated costs we present as part of our bid.

I've been to Kings Bay, in St. Mary's, Georgia, three times. The first time word got back to me that I didn't act appropriately, that I wasn't appropriately deferential. So I have returned a couple of times. I did not get any of the hundreds of millions of dollars of work let there in the 1980's, and neither did most minority firms.

The military's uncooperative attitude toward our company is obvious and it is borne out by statistics that reflect their unwillingness to work with us. Of all the military spending in Georgia, I know of only two contracts that were set aside for minority contractors as part of the Department of

Defense's five percent goal program for small disadvantaged businesses.

Other government agencies have their own particular brand of subjectivity that discriminates against minorities. We have found, for instance, that common suppliers working on projects routinely give white subs better prices for materials than they do black subs. This happens for other projects as well. In one instance a black subcontractor came in and we compared its bid with the other bids we received and they were higher. We told them that their materials were higher and to go to the supplier and see if they could get a better quote. The supplier wouldn't give them the lower quote.

As I mentioned earlier, government contracts represent only a small percent of the construction market. Even though they constitute the source of most of our business, this is not what we desire. We are not getting private sector work because we are outside the network of white contractors who are invited to bid on projects. Private sector work is controlled by owners and developers who invite contractors to bid on their projects. This extraordinarily lucrative work amounted to $1 billion of construction in Atlanta during the last year. Our company has never been invited to bid on a large project that has an invited bidder's list (except for one City of Atlanta list and one U.S. Postal Service list). Moreover, our firm, a reputable organization, has never been included on the short list for any private development work on jobs of any size (except four or five small branch banks with C&S National Bank and Trust Company Bank. At best this is extraordinarily puzzling to me, a Harvard MBA with a decade of experience, a quality firm with a 30 year history.

By way of comparison, a Harvard classmate who graduated in the early '70s, a very nice man, started a construction firm upon graduation. He had no experience in the construction industry; his area of expertise was manufacturing. Yet, in the early 1980's, his firm was the largest active contractor in Atlanta.

In another example, a majority individual who started his construction company in 1985 is now doing $55 million worth of construction and 90 percent of their contracts were negotiated, all of them bonded. E.R. Mitchell Construction has only been able to receive a $4 million bond, this with 30 years of experience as a firm. I find this difference of experience simply amazing considering the similarity of our backgrounds.

We have assiduously pursued any and all business opportunities that we have learned about. We have an aggressive marketing and development effort with one person in our firm who makes personal contacts and phone calls, and tracks the Dodge Report information. Hoping to expand our experience in large multi-million dollar projects, I approached a major developer of a 50-story tower in Atlanta. I suggested that I would be interested in being a joint venture partner with their white general contractor. The developer responded by saying that they were philosophically opposed to joint ventures. Soon after, I learned that this developer placed a white firm as a joint venture partner with the general contractor. Wanting to personally make sure that this was in fact the case, I contacted the developer and asked why he had not been willing to give consideration to my firm as a joint venture partner for even five percent of the project when he had just happily and comfortably approved a joint venture with a white firm. The developer's response was that there were "special, changed circumstances" in the project.

In another instance, I attempted to get placed on the invited bidders list for the construction of a gymnasium at a private school in Atlanta. I saw this as an appropriate opportunity since we had just completed a similar gymnasium project for the City of Atlanta. Nevertheless we were not invited to bid on the project. Much to our amazement, the white firm with which we were joint venture partners on the City of Atlanta gym project, which is about the same size as our company, was invited to bid on the project. This majority firm got the job.

Unfortunately this same scenario of requesting to be considered to bid and then not being included has been replayed numerous times. Even with the right numbers and experience we are almost never been shortlisted on private projects, except for the bank projects. My conclusion is that qualified black firms are outside the business network of established white firms. By virtue of being outsiders to their communications loop, it is impossible to successfully bid because we remain forever strangers to white owners and developers.

We have marketed our company aggressively to private sector owners and developers by making phone calls, sending letters, and initiating personal contacts. We have committed one staff person solely to marketing our company and identifying opportunities and developing contacts. We have been unsuccessful even in getting invitations to bid on private projects. I have experienced the same problems my father did, in a world that is supposed to be substantially improved. Still black firms are not granted access to opportunities. I never imagined that I would be the second generation of Mitchell's to be fighting discrimination a quarter of a century after the passage of the Civil Rights Act.

In truth, Mr. Chairman and Members of the Committee, from where I sit "special, changed circumstances" quite clearly mean "discrimination." I am here today because I know personally and as a citizen of this great country, that we cannot allow nonsensical excuses to parade before us as anything more or less than what they are: racial discrimination.

It is important to share with you one other very important area where I have knowledge of unfair, patently discriminatory practices that inevitably restrict minority businesses from participating on an equal footing with our majority business counterparts. I am speaking here about bonding practices -- that critical insurance, performance and payment bonds, for projects which are issued by sureties.

When it comes to bonding, I've heard it all. I believe I have heard all the excuses ever offered by a bonding company for refusing to give us a bond, and because this industry is not subject to any federal scrutiny or regulation, by law they can discriminate. What I hear is:

- You don't have experience in this area.
- You don't have the required track record.
- We don't bond 8(a) contractors.
- We don't like this, but we don't bond (minority) joint venture contractors.
- You made too much money last year.
- This isn't your type of work.
- Your company is not big enough.
- Your company is too big.

And this from the dean of the Atlanta bonding industry, who was apologizing because there was no reason not to bond us:

- I'm sorry. We just can't bond you.

Yet I know of one instance in which a surety bonded a white firm in complete contravention to the surety's stated bonding guidelines.This white firm obtained a construction bond even though it had absolutely no prior experience in the type of construction for which it was being bonded. In addition, the surety provided a bond for this project in an amount 17 times greater than the financial net worth of this white construction firm. Yet qualified black construction firms that meet standard bonding requirements cannot obtain reasonable bonds.

In one project we were working on, a housing project, our white joint venture partner couldn't believe that we were not able to get bonding. That firm called our bonding company to find out what was going on. Actually, he said: Give Mitchell the bond. So we got the bond. They felt badly about this situation, but many firms do not.

How is this possible? The answer is that the bonding industry's criteria are subjective and allow for extensive subjective decision-making. These criteria create standards that are arbitrary and allow for undue discretion. Double standards are imposed on the basis of race. Federally-regulated banking requires full disclosure of practices. Sureties are so powerful they can artificially constrain the rate of MBE growth by denying bonds.

Since the Richmond v. Croson decision we have returned full circle to the nearly impossible conditions of the 1950's. Where before possibilities existed and consideration would be given during the seventies, then in the eighties documentation was necessary to show achievement of goals, now again we find ourselves in the position where people tell us it is illegal for us to joint venture with you. Now people have a license to interpret inclusion of minorities as illegal.

The National Association of Minority Contractors (NAMC) is a trade association of general and subcontractors whose membership is approximately 99 percent black. We represent some 3,000 companies nationwide, about 150 in Atlanta. NAMC came into existence because the Associated General Contractors (the AGC) and the American Subcontractors Association (ASA) devote themselves to the needs of majority contractors and, we believe, work to undermine the entrance of minority contractors into the lucrative construction field.

I fervently believe that a company that is competent, honest, and delivers a quality product will prosper -- in a world where there are no undue barriers. Unfortunately this is not the case for minority firms. Insurmountable barriers currently prevent capable minority firms from obtaining work. Since 1980 I have seen several black construction firms frustrated out the the market and out of business because of discrimination. Fair opportunities are necessary for businesses to operate fairly. Currently NAMC has found that discrimination has artificially depressed the availability of minority businesses in the construction industry.

Fewer opportunities now exist in this post-Richmond environment for minority business growth. Where once MBEs were society's vehicle for providing jobs to minorities, because fewer than half of all majority firms employ minorities according to the Commerce Department, fewer minorities are employed. At a time when our country faces a growing need for employment options for young minority men and women, the lack of MBE programs has stifled the prospect of job creation.

Minorities and women do not often choose to go into construction because these discriminatory factors are so obvious. I saw these problems. I was almost deterred, as I'm sure many are, before they even start. I felt that way. If you want to succeed as a well-educated black man or woman, you get a law degree, or go into medicine and overcome discrimination with education. I know because that's what I was going to do. Construction is a tough industry to begin with. Add to that the weather working against you and the double whammy of discrimination -- it is overwhelming. I thought I could do it a little bit different, perhaps change the industry a little bit by building a quality black construction firm. Frankly, I am discouraged.

In my father's day racism was blatant. People called us names. Now, it's infinitely more subtle. Now people say: I didn't like their attitude. He rubbed us the wrong way. They didn't come with their hat in their hand, which is what happened at King's Bay. Or the firm wasn't a good fit. These are the quiet words of discrimination and exclusion. Until the bonding industry is accountable by a set of rules or guidelines -- be it 10, 20 or 3 times net worth -- we will never be able to comply with ever-fluid rules.

Bonding companies don't usually turn you down in writing, so there is no paper trail. The bonding company usually tells the agent, "Oh, we don't want to review the case; we're overloaded with paperwork -- just tell them," so there is no record of the refusal and accompanying reasons for rejection.

Within this covert environment of subtle racial discrimination, we espeically thank your for your consideration and frank attention.

* * *

NAMC NATIONAL ASSOCIATION OF MINORITY CONTRACTORS
806 15th Street, N.W. • Suite 340 • Washington, D.C. 20005 • (202) 347-8259

RESOLUTION

The following resolution was adopted by the general membership of the National Association of Minority Contractors on June 23, 1990:

WHEREAS, the National Association of Minority Contractors (NAMC) established in 1969, is the principal voice of the more than 60,000 minority-owned construction firms in America; and

WHEREAS, members, friends, and supporters of NAMC have come together in Kansas City, Missouri during June 20-24, 1990 for the purpose of celebrating its 21st Annual Convention; and

WHEREAS, the main objective of NAMC is to address the needs and concerns of minority construction contractors through the dissemination of information, the identification of procurement opportunities, the delivery of specialized training and the insistence of a discrimination-free construction marketplace.

BE IT RESOLVED AS FOLLOWS:

1. The 1989 U.S. Supreme Court case of Richmond vs. Croson has curtailed the efforts of States and localities to facilitate minority participation in government construction projects. NAMC supports the enactment of federal legislation which would ease the burdens imposed upon states and localities by the Richmond ruling and which would allow states and localities to adopt reasonable minority business utilization programs.

   ✓ We support S.1235 (introduced by U.S.Senator Paul Simon (D.Ill.)) and legislation introduced by Representative John Conyers (D.MI) (Economic Equality Act of 1989) as well as other Congressional efforts intended to reverse the negative impact of Croson;

2. Minority contractors continue to be denied meaningful access to surety bonding - particularly in the corporate surety market. This phenomenon has cost minority contractors billions of dollars in procurement opportunities. NAMC urges the U.S. Department of Treasury to grant its petition for rule-making change of June 6, 1990 which would prohibit U.S. Treasury-listed corporate sureties from discriminating on the

---

basis of race and would require the delisting of corporate sureties which consistently refuse to do business with minority contractors.

Moreover,

a) The bonding requirement threshold of $25,000 as contained in the Miller Act should be increased to $1,000,000.

b) The Surety Association Act of 1989, H.R. 4179, which would allow individuals to form surety associations in order to pool their resources and bond federal projects should be passed with all deliberate speed.

3. The Davis-Bacon Act has a disproportionately negative impact upon minority contractors. Its applicability should be raised from $2,000 to $1,000,000.

4. The combining of minority and women-owned business enterprises into a single 10% Disadvantaged Business Enterprise (DBE) Goal under the Surface Transportation Uniform Relocation Act (STURA) has resulted in a significant and continual decrease in contract dollars for minority contractors. While NAMC does not oppose the participation of legitimate women contractors in government construction projects, NAMC supports the separation of goals for minority and women contractors.

5. By the year 2000 there is projected to be a substantial shortage of skilled construction craftsmen, causing a serious problem in the nation's building industry. Only by training almost one million minority workers over the next 10 years can the industry avoid this problem. NAMC will work with other national construction trade organizations to alleviate this impending problem only to the extent that such organizations are also committed to minority participation in all areas of the construction industry, i.e., superintendent positions, pension fund boards and construction firm owners.

   NAMC encourages support for its Participation 2000 Program designed to address this issue.

6. Racial discrimination is still prevalent during all stages of employment, including application for the job, performance on the job, and termination from the job. NAMC, thus, supports the Kennedy-Hawkins Civil Rights Act of 1990 without amendments or revisions.

7. NAMC requests the Small Business Administration (SBA) to review its current procurement and negotiation process to

assist 8(a) contractors in understanding the complex requirements of the Federal Acquisition Regulations and to work closely with these firms to assure that there are no inadvertent or unintentional violations of the defective pricing regulations or disclosure requirements. NAMC also requests the SBA to publish written policy guidelines which specifically define what constitutes proper rental and lease arrangements, subcontracting relationships, joint-venture agreements and similar legal relationships.

WE HEREBY SET OUR HANDS AND SEAL AS INDICATED BELOW ON THIS 23RD DAY OF JUNE, 1990.

Prepared Statement of Harris Morris

STATEMENT
OF
DELTA AIR LINES, INC.

BEFORE THE
COMMITTEE ON PUBLIC WORKS & TRANSPORTATION
U.S. HOUSE OF REPRESENTATIVES

AUGUST 8, 1990
ATLANTA, GEORGIA

MR. CHAIRMAN AND MEMBERS OF THE COMMITTEE, DELTA AIR LINES APPRECIATES THIS OPPORTUNITY TO PROVIDE THE COMMITTEE WITH ITS VIEWS ON AVIATION INFRASTRUCTURE ISSUES IMPORTANT TO THE METROPOLITAN ATLANTA AREA. ON BEHALF OF DELTA AIR LINES, I WANT TO COMMEND CONGRESSMAN LEWIS FOR HIS LEADERSHIP AND HIS EFFORTS ON THE AVIATION SUBCOMMITTEE TO PRESERVE THE OUTSTANDING AVIATION SYSTEM WE ENJOY IN OUR GREAT CITY. ATLANTA HAS INDEED BEEN FORTUNATE OVER THE YEARS IN HAVING CIVIC AND POLITICAL LEADERS WHO HAVE RECOGNIZED THE IMPORTANCE AND VALUE TO THE AREA'S ECONOMIC DEVELOPMENT ASSOCIATED WITH AN EFFICIENT TRANSPORTATION SYSTEM.

DELTA HAS CONSISTENTLY ADVOCATED THAT THE CITY OF ATLANTA, IN CONCERT WITH OTHER GOVERNMENTAL ENTITIES OWNING OR OPERATING AIRPORTS (OR HOLDING FUTURE AIRPORT SITES), SHOULD MAINTAIN A STRONG, EFFICIENT AND EFFECTIVE AIRPORT SYSTEM TO MEET THE NEEDS OF METROPOLITAN ATLANTA. DELTA'S POSITION IN THIS RESPECT HAS NOT CHANGED, ALTHOUGH, AS A RESULT OF DEREGULATION, MANY NEW FACTORS MUST NOW BE CONSIDERED.

DELTA STRONGLY SUPPORTS EFFORTS TO EXPAND THE CAPACITY OF HARTSFIELD ATLANTA INTERNATIONAL AIRPORT. THE MAXIMIZATION OF HARTSFIELD'S CAPACITY IS ESSENTIAL TO MAINTAINING ATLANTA'S POSITION AS A DOMINANT HUB AND A GROWING INTERNATIONAL GATEWAY AIRPORT SERVING THE SOUTHEASTERN PART OF THE UNITED STATES. THIS EXPANSION INVOLVES AIRFIELD, LANDSIDE, AIRSIDE AND SUPPORT FACILITIES TO MEET FUTURE DEMAND AND GROWTH. AIRFIELD IMPROVEMENTS WILL INCLUDE A NEW COMMUTER/REGIONAL AIR CARRIER RUNWAY, HOLD PADS AND OTHER IMPROVEMENTS IN THE AIRFIELD TO INCREASE GROUND AIRCRAFT OPERATIONAL FLEXIBILITY. FAA IS CURRENTLY CONDUCTING TESTS IN MEMPHIS AND RALEIGH-DURHAM AIRPORTS OF A NEW RADAR SYSTEM THAT IS DESIGNED TO ENABLE SIMULTANEOUS APPROACHES ON RUNWAYS WITH A SEPARATION DOWN TO A POSSIBLE 2,500 FEET. THE RESULTS OF THESE TESTS HAVE BEEN POSITIVE AND INSTALLATION OF PRECISION RADAR EQUIPMENT AT HARTSFIELD WOULD GREATLY ENHANCE THE AIRPORT'S CAPACITY AND REDUCE DELAYS.

DELTA BELIEVES THAT IMPROVEMENTS TO AIRSIDE FACILITIES WOULD FACILITATE ADDITIONAL GROWTH THROUGH THE CONSTRUCTION OF NEW TERMINAL SPACE. WE SUPPORT THE CONSTRUCTION OF A NEW CONCOURSE DEDICATED FOR INTERNATIONAL OPERATIONS

(CONCOURSE E) AND NEW FOREIGN INSPECTION STATION (FIS) FACILITIES TO MEET THE DEMANDS OF EXPECTED GROWTH IN INTERNATIONAL OPERATIONS. EXISTING CONCOURSES AND TERMINAL FACILITIES MUST BE IMPROVED AND EXPANDED TO ENHANCE CONCESSION AREAS AND AIRLINE/OPERATIONAL SERVICE AREAS IN ORDER FOR THE ENTIRE FACILITY TO MEET THE GROWING NEEDS OF THE AREA.

THE ATLANTA REGIONAL COMMISSION (ARC) IS CONDUCTING A TWO-PHASE STUDY TO ASSESS THE NEED AND METHODS BY WHICH ADDITIONAL AVIATION CAPACITY CAN BE PROVIDED TO THE METROPOLITAN ATLANTA AREA. PHASE I OF THIS STUDY HAS BEEN COMPLETED AND CONCLUDES THAT THE SHORT TERM ALTERNATIVES ARE THE MAXIMIZATION OF HARTSFIELD AS OUTLINED ABOVE. THE LONG TERM SOLUTION IS THE "IMMEDIATE PURSUIT OF A LOCATION FOR THE CONSTRUCTION OF A SECOND AIR CARRIER AIRPORT TO SERVE THE REGION'S FUTURE NEEDS" THE SECOND PHASE OF THE STUDY HAS BEEN COMMISSIONED BY ARC AND IS PROCEEDING. THIS PHASE IS TO DETERMINE THE RECOMMENDED SITE FOR A SECOND AIR CARRIER AIRPORT AND WILL EVALUATE ALL POTENTIAL SITES FROM ECONOMIC, ENVIRONMENTAL, OPERATIONAL AND SERVICE STANDPOINTS.

ALTHOUGH THERE ARE MANY CONDITIONS AND CRITERIA THAT MUST BE EVALUATED AS PART OF THE SITE SELECTION PROCESS, WE FEEL THAT THE REVIEW SHOULD CONCENTRATE ON THE TOP FOUR CRITERIA THAT HAVE BEEN SELECTED BY THE ARC PROJECT ADVISORY TEAM. THESE EVALUATION CRITERIA ARE:

1) PROXIMITY TO PASSENGERS;
2) FLEXIBILITY TO ACCOMMODATE FUTURE DEMAND;
3) IMPACT ON HARTSFIELD AIR SPACE AND CAPACITY; AND
4) POTENTIAL FOR ADVERSE ENVIRONMENTAL IMPACT.

IN OTHER WORDS, THE MOST IMPORTANT OBJECTIVE IN CONSIDERING A SITE FOR A SECOND AIR CARRIER AIRPORT SERVING THE METROPOLITAN ATLANTA REGION IS ITS ABILITY TO REASONABLY AND CONVENIENTLY SERVE THE CUSTOMER -- THAT IS, THE FLYING PUBLIC. SECONDARILY, THE NEW AIRPORT SITE MUST HOLD THE POTENTIAL TO BE EXPANDED TO ACCOMMODATE FUTURE DEMAND. DELTA FEELS THAT IT IS CRITICALLY IMPORTANT THAT ANY FUTURE SITE NOT ADVERSELY IMPACT THE CAPACITY OF HARTSFIELD'S PRESENT AND FUTURE OPERATIONS. WE MUST MAINTAIN HARTSFIELD AS A PRIMARY CONNECTING HUB AND THE INTERNATIONAL GATEWAY FOR THE SOUTHEAST.

DELTA CONTINUES TO PARTICIPATE ON THE ARC TASK FORCE ADVISORY GROUP AND SUPPORTS THE SELECTION OF A POTENTIAL SECOND ATLANTA AIR CARRIER AIRPORT SITE NORTH OF HARTSFIELD. THE CONSTRUCTION OF A SECOND AIR CARRIER AIRPORT NORTH OF HARTSFIELD SHOULD COMMENCE WHEN IT CAN DEFINITELY BE DETERMINED THAT HARTSFIELD'S CAPACITY WILL, IN THE REASONABLY NEAR FUTURE, NO LONGER BE ABLE TO APPROPRIATELY HANDLE ALL DEMAND THAT WILL BE PLACED UPON IT. DELTA FEELS, BASED ON A REVIEW OF FAA CAPACITY STUDIES AND FAA FORECAST DATA, THAT WITH A NEW COMMUTER RUNWAY AT

HARTSFIELD ATLANTA INTERNATIONAL AIRPORT, THE CURRENT OPERATIONAL TECHNIQUES USED BY FAA AIR TRAFFIC CONTROL WOULD SUPPORT 1.1 TO 1.2 MILLION ANNUAL OPERATIONS WITHOUT EXCESSIVE DELAYS. THIS VOLUME IS EXPECTED TO OCCUR WELL AFTER THE YEAR 2000. THEREFORE, THE CONSTRUCTION OF A SECOND AIR CARRIER AIRPORT SHOULD BE TARGETED TO ACCOMMODATE GROWTH BEYOND THE CAPACITY LIMIT OF 1.2 MILLION OPERATIONS PER YEAR. IF HARTSFIELD IS SUCCESSFULLY MAXIMIZED AND FORECAST GROWTH IS EXPERIENCED, THE DETAILED DESIGN AND CONSTRUCTION OF A SECOND AIRPORT WILL NOT BE REQUIRED UNTIL AFTER THE YEAR 2000 AS THE REQUIREMENTS BECOME MORE CLEAR.

DELTA HOPES THAT ITS COMMENTS WILL BE USEFUL TO THE COMMITTEE'S DELIBERATIONS CONCERNING THE AVIATION CAPACITY NEEDS OF OUR REGION. A STRONG, EFFICIENT AND EFFECTIVE ATLANTA AIRPORT SYSTEM IS OF THE UTMOST IMPORTANCE TO DELTA, AND DELTA WILL CONTINUE TO ACTIVELY SUPPORT EFFORTS TO PRESERVE ATLANTA'S PREEMINENCE AS AN AIR TRANSPORTATION HUB.

THANK YOU FOR THIS OPPORTUNITY TO APPEAR AT THIS HEARING. I WOULD BE GLAD TO ANSWER ANY QUESTIONS YOU MAY HAVE RELATIVE TO OUR TESTIMONY.

TESTIMONY OF ROBERT B. REMAR ON BEHALF OF CAUTION, INC.[1/]

BEFORE THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE
OF THE UNITED STATES HOUSE OF REPRESENTATIVES
ATLANTA, GEORGIA
August 8, 1990

I

INTRODUCTION

The Atlanta metropolitan area has experienced phenomenal growth over the past two decades. Atlanta has become the economic hub of the Southeast and one of the leading metropolitan areas in the country. With Hartsfield International Airport, Atlanta has truly become an international city. However, the infrastructure of the Atlanta metropolitan area has been unable to cope with the extraordinary demands placed upon it by rapid population and economic growth. The region's water distribution system is both old and insufficient to meet current needs. Water restrictions are now a part of summer life. Many bridges are in serious states of disrepair. These decaying bridges present not only a potential disruption to the transportation system but a serious public safety threat. Many surface streets are deteriorating and require resurfacing, resignalization and intersection improvements. Perhaps most distressful is the fact that the stock of decent low and moderate income housing has been

---

[1/] CAUTION, INC. is an acronym for Citizens Against Unnecessary Thoroughfares In Older Neighborhoods. CAUTION, Inc. is a nonprofit community based corporation whose Board of Directors is composed of representatives from the organized neighborhood associations affected by the proposed Presidential Parkway. Robert B. Remar is CAUTION's attorney.

markedly reduced and the condition of existing low and moderate income housing is a local and national disgrace.

All of these pressing infrastructure needs are coming to a head in a time of a growing national deficit accompanied by a slowdown in the economy. Budget cuts and the reordering of budgetary priorities are essential. Precious national resources must be allocated to those projects which will serve the most pressing public needs. Yet the Georgia Department of Transportation, in cooperation with the Federal Highway Administration, continues to press the construction of an unneeded, unnecessary and extraordinarily expensive limited access highway known as the Presidential Parkway. As one step in the national effort to deal with infrastructure needs in the face of the budget crisis, the Presidential Parkway project should be ended for good, the funds reallocated to pressing urban infrastructure needs, and the over 200 acres of abandoned right-of-way redeveloped consistent with community needs and desires.

II

THE PRESIDENTIAL PARKWAY

The proposed Presidential Parkway runs 2.2 miles from the Boulevard/Glen Iris stub of the I-75/I-85 downtown connector and terminates at the Atlanta city limits on Ponce de Leon Avenue at Clifton Road.[2/] The Parkway is four lanes, elevated in a number

---

[2/] The Boulevard/Glen Iris stub was originally constructed as part of the interchange for the abandoned Stone Mountain Tollway and I-485 projects.

of areas and includes a full diamond interchange at Moreland Avenue. The present road design also includes an "ice canopy" that it is hoped will provide protection to the public from the lethal danger of ice falling from the WSB Broadcast Tower under which the Parkway is to be built. The canopy will be a concrete structure approximately 675 feet long, 137 feet wide at its widest point and 17 feet above the roadbed.

The Parkway traverses or abuts seven historic districts including the Martin Luther King, Jr. historic district, the Inman Park historic district and the Druid Hills historic district. See Map attached hereto as Exhibit "A". The Inman Park historic district is known as Atlanta's first suburb and is listed in the National Register of Historic Places. The Druid Hills subdivision was planned by the renowned landscape designer and urban planner Frederick Law Olmstead. It is an area of national historic importance and is listed on the National Register of Historic Places.

Particularly distressing is the fact that the Parkway will traverse portions of four historic public parks owned by the City of Atlanta, two located in the Candler Park historic district and two located in the Druid Hills historic district. Goldsboro Park and Candler Park are significant public recreation facilities that will be substantially disrupted by the Parkway. A significant portion of a public golf course in Candler Park will be destroyed. The Parkway will also run through Shadyside and Dellwood Parks, two of the six Ponce de Leon parks developed by Frederick Law Olmstead as part of the original concept of Druid Hills. These parks are of national historic significance and are on the National Register of Historic Places. They represent an invaluable local and national resource whose integrity will be destroyed by the proposed Parkway.

In early 1988 the Georgia Department of Transportation estimated direct construction costs to be $34 to $40 million. Expenses associated with the reconstruction of the Boulevard/Glen Iris exit ramp to accommodate the Parkway are approximately $48 million. The Parkway will also utilize 90 to 100 acres of land. In 1985 the Georgia Department of Transportation valued this land at $185,000 an acre. The value of the right-of-way to be consumed by the Parkway is at least $16.7 to $18.5 million, using 1985 dollars. Therefore, the real cost of the Parkway is a minimum of $51 to $58 million for construction and land costs and as much as $80 to $90 million including rebuilding the stub. The Presidential Parkway conservatively costs approximately $36.5 million per mile.

The Georgia Department of Transportation and the Federal Highway Administration are the only agencies that support construction of the Parkway. The Atlanta City Council, the DeKalb County Commission and the City of Decatur have all passed resolutions or ordinances opposing the Parkway. Mayor Maynard Jackson has stated his clear opposition to the Parkway. All of the affected neighborhood organizations along with numerous community groups are opposed. Privately commissioned polls show strong city-wide opposition even outside of the affected neighborhoods. All of the major environmental organizations, as well as the National Trust For Historic Preservation, are on record as opposing the Parkway.

III

THE GREAT PARK

The Georgia DOT's insistence on proceeding with the Parkway despite almost unanimous opposition has also stymied efforts by the City and the affected neighborhoods to redevelop the abandoned I-485 and Stone Mountain Tollway rights-of-way, known locally as the Great Park. This acreage was acquired in the late 1960's and early 1970's by the Georgia Department of Transportation as rights-of-way for two multiple lane limited access highways, I-485 and the Stone Mountain Tollway. Hundreds of homes were acquired and destroyed and entire neighborhoods decimated. The community mobilized to fight back. In 1971 a federal district court decision suspended action on the I-485 project pending the completion of an environmental impact statement. Community opposition led then Governor Jimmy Carter to appoint a commission to review the Stone Mountain Tollway project. The commission recommended that the Stone Mountain Tollway not be built until the effect of the impending construction of the MARTA east rail line could be assessed. In December 1972 Governor Carter terminated the project.

In 1974 the Atlanta Regional Commission deleted I-485 from the regional transportation plan and in 1975 the Federal Highway Administration approved the withdrawal. In 1977 the Georgia Department of Transportation began disposing of I-485 properties north of St. Charles Avenue, leaving 219 acres of right-of-way abandoned and undeveloped. This massive tract of land is not only unsightly, but it constitutes a public safety and health menace.

Over the years numerous plans have been proposed for development of the Great Park area. The central feature of the Great Park plans has been the development of housing, including low and moderate income housing, along with recreation and other community amenities. All of these plans have been stymied by the Georgia Department of Transportation's refusal to release the property until the Presidential Parkway is built. Former Georgia DOT Commissioner Thomas Moreland succinctly stated the DOT's position when he said that he was holding the Great Park land hostage to the Presidential Parkway. Elimination of the Presidential Parkway project will not only save valuable federal and state money, but it will also permit development of the Great Park area, including the development of much needed housing.

IV

ALTERNATIVES TO THE PRESIDENTIAL PARKWAY

Not only is the Presidential Parkway project unwanted, it is also unneeded. Former Georgia DOT Commissioner Moreland admitted that even using DOT's figures, the traffic volumes only marginally justified building the project. Questions concerning the accuracy of Georgia DOT's traffic projections, including possible manipulation of data, have recently surfaced in the news media. See Atlanta Journal - Atlanta Constitution (September 11, 1988), attached hereto as Exhibit "B".

The traffic corridor proposed to be served by the Presidential Parkway is already served by the MARTA east rail line. Efforts should be directed toward encouraging motorists to utilize the MARTA system and reduce dependence on automobiles for commuting. Signalization and intersection improvements will increase the ability of Ponce de Leon Avenue to handle existing and projected traffic needs. An objective view of the situation demonstrates that this 2.2 mile limited access highway is clearly not needed to fulfill any local or regional transportation need.

The only other argument advanced in support of the Presidential Parkway is the need to provide access to the Carter Presidential Library. When the Presidential Parkway project was presented to the Atlanta City Council in 1982 it was projected that there would be 1.2 million visitors per year to the Carter Center. Actual visitation was 119,000 in calendar year 1988 and 86,440 visits in 1990. In contrast, the Fernbank Science Center, located in the Druid Hills area, has in excess of 800,000 visitors a year. Access to the Fernbank Science Center is by two-lane surface roads through residential neighborhoods. Any concerns about access to the Carter Center can be resolved by improvement to existing surface streets which are clearly adequate to handle the traffic volumes. Moreover, with the abandonment of the Presidential Parkway and reuse of the Great Park land the neighborhood appearance in the approaches to the Carter Center will be substantially improved.

While initially the argument was raised that the Presidential Parkway was necessary in order for the Carter Center to be constructed, that argument now has no validity since the Carter Center is constructed and operating. Nor is there any danger that the land surrounding the Carter Center now used for gardens and parking would in any way be threatened by abandonment of the Presidential Parkway project. The Georgia DOT has already received Federal Highway Administration permission under the Fowler Amendment, 23 U.S.C. Section 103(e)(5), for the transfer of 45 vacant parcels of land to the Carter Library, Inc. Federal regulations also permits reuse of rights-of-way without any federal payback if the property is used for a public conservation or public recreation purpose or for any other public purpose found by the Secretary of Transportation to be in the public interests. 23 C.F.R. Section 480.107. Under both state and federal law the Carter Center can continue to operate and the adjoining acreage used for a public purpose without the repayment of any federal funds.

V

CONCLUSION AND SUMMARY

The proposed Presidential Parkway is not needed to serve any transportation function. It will severely disrupt historic neighborhoods and four publicly owned historic parks. The project is opposed by all the affected local governments, neighborhoods and community organizations. The federal funds to be used in the Parkway should be spent on meeting other transportation related infrastructure needs, including bridge repairs. By eliminating the Presidential Parkway the 219 acres of abandoned right-of-way can be reused and revitalized to meet pressing community needs. As a matter of both economic and common sense, the Presidential Parkway project should be killed for good.

Battle of the Parkway: A High-Stakes Saga Still in the Making

By Bert Roughton Jr.
Staff Writer

THE ROAD: 27 YEARS OF CONTROVERSY ☐ 24-25A

When traffic projections for the Presidential Parkway kept coming up short, Tom Moreland repeatedly sent his staff back to the drawing boards until their numbers justified the road, former Department of Transportation (DOT) employees have told The Atlanta Journal-Constitution.

And when neighborhood opposition to the road became fierce, Mr. Moreland, the former transportation commissioner, ignored the counsel of his top lieutenants, who advised him to abandon the roadway, the former employees say.

The stakes, then as now, were high: If the DOT failed to show the $30 million parkway was needed, federal funding for the road would have been jeopardized, posing a direct threat to the Carter Presidential Center, which was officially linked to the road.

Such dauntless tenacity — on both sides — has driven the Battle of the Presidential Parkway for six years. The battle is only the latest chapter in a 27-year saga of the state's efforts to build a highway connecting downtown to Stone Mountain through the city's residential heart.

The saga's characters include former President Jimmy Carter and Mayor Andrew J. Young. They opposed the Stone Mountain Freeway but have led the fight for the 2.4-mile Presidential Parkway.

Their adversaries are zealous neighborhood activists who have mastered the art of yuppie-style guerrilla warfare. They've raised hundreds of thousands of dollars for lawsuits and chained themselves to bulldozers to stop the road.

While court battles continue, another kudzu crop is maturing on the 219-acre cross-shaped right of way just

PARKWAY Continued on 24A

Parkway

From Page 1A

east of downtown. For most of nearly two decades, the wild vines have had free run as a parade of grand — occasionally grandiose — development plans were hatched, rejected and shelved.

Only former President Carter's Presidential Center has gained a foothold in that time, sprawling near the crest from which Gen. William T. Sherman directed the burning of Atlanta.

But road supporters now predict the bulldozers will be rolling again by the end of the year. The optimism stems in part from their most recent victory: Mayor Young's veto last week of a last-ditch anti-parkway move by City Council members.

The council had wanted the city attorney to contest the DOT's condemning city parkland for the road. The mayor's narrow victory, which was secured by intense lobbying, cost parkway opponents a precious opportunity to fight the road.

Only slightly daunted by the council defeat, anti-road warriors say they will press on. They believe the costly road would do irreparable damage to historic neighborhoods and disfigure parks along Ponce de Leon Avenue designed by Frederick Law Olmsted, the father of landscape architecture who designed Druid Hills and New York's Central Park.

Road opponents say they are quietly crafting new weapons to keep the DOT in court and off the parkway long enough for the political tide to wash the road away forever.

A key addition to their arsenal could be a bill being written by U.S. Rep. John Lewis, the 5th District congressman and longtime road opponent. Mr. Lewis's bill would make the parkway ineligible for federal funding.

Even so, the realists among the opponents admit time is running out.

"The numbers [of forums] are declining but they are not exhausted," says Richard M. Ossoff, a member Inman Park resident and a vice president of the anti-parkway coalition, CAUTION Inc.

Road opponents believe the DOT also is battling a deadline. Both likely mayoral candidates, former Mayor Maynard Jackson and Fulton County Commission Chairman Michael Lomax, have taken strong public stands against the road and could work to cancel the project.

For now, the undeveloped 190 acres remain untended, and people who live nearby say the site is an eyesore and a haven for criminals.

Rain-stiffened rags, mildewed sofas, old tires and assorted junk are strewn in the weeds just west of the Carter Center. Broken dark brown beer bottle glass is everywhere. The only reminders that this is freeway land are concrete pylons that stand like a new-age Stonehenge.

Transportation Commissioner Hal Rives, who succeeded Mr. Moreland, makes no bones about his willingness to let the vines grow and rats breed, forever if necessary.

"Until the parkway is built, neither I nor my board is gonna give up that land," Mr. Rives says.

• • •

The precursor of today's parkway fight dates back to when Jimmy Carter was a household name only in his own house.

In the 1960s and 1970s the same intown neighborhoods that are fighting the parkway battled to defeat the Stone Mountain Freeway. Ironically, Mr. Carter vetoed the freeway when he was the governor in 1972. He had the strong support of Mayor Young, who at the time was the 5th District congressman. The proposed Interstate 485, which would have intersected the freeway, was killed two years later.

The vetoes came too late for the 520 homes in the Copenhill neighborhood. They were bulldozed in the late 1960s, leaving a vacant cross of land where the interchange was supposed to go.

Beginning in 1974, several development plans for the Great Park were produced, but nothing happened until 1981, when Mr. Carter returned to Georgia fresh from his defeat to President Reagan.

The land now occupied by the Carter Center lies in what would have been the intersection of the defunct freeways. The center obtained the 3.1 acres where the buildings sit in a land swap with the DOT and has a state permit to operate and maintain the remaining 27 acres as a highway roadside park, Mr. Rives says.

Mr. Carter, who has attempted vainly to remain above the fray, believes the parkway would enhance the center and neighborhoods by which it will pass, says Terrence B. Adamson, the attorney who represents the former president and his center.

"That's one of the strange ironies: Who's closer to that parkway as a neighbor than us?" Mr. Adamson says. "We're not going to spend $4 million on landscaping and building a beautiful park with lakes and gardens that all the people in the neighborhoods and citizens of the city can enjoy and surround it with something that's not in keeping with that."

Because the land originally was condemned for freeways, state law requires that it be used either for a transportation project or offered back to its original owners, Mr. Adamson says. If the road isn't built, he says, the center would lose its legal claim to the land.

However, Mr. Ossoff scoffs at the notion that the road still needs to be built to protect the center. "I want you to imagine a scenario in which bulldozers are creeping up over the hill to plow under Mr. Carter's $4 million of landscaping and fill in the lakes and plow under the Japanese garden and kill the carp flown in on Japan Air Lines," he says.

The legal problem of saving the center while killing the road is merely technical, he says. For example, the Legislature could declare the center a park and turn it over to the state Department of Natural Resources for management.

Mr. Adamson argues that Mr. Carter can deal only with what the law now says. "This is a nation of laws; President Carter is a man of laws," he says.

Opponents say laws can be changed, and were when road supporters needed the Legislature to give the DOT a legal tool — the state Condemnation Commission — to condemn city parkland.

Road opponents also believe Mr. Carter, whom many of them admire, would be more flexible if he had not been forced into a political corner by Mr. Moreland's insistence on building the road.

Mr. Moreland often is portrayed by road opponents as a Captain Ahab corrupted by the reckless pursuit of his own Great White Whale.

The former DOT employees interviewed by the Journal-Constitution see Mr. Moreland less harshly — they see him, rather, as a talented leader convinced of his own skills and impatient with those who impeded him.

"Mr. Moreland wanted this roadway badly," former employee close to the project says. "He saw it as a roadway that was clearly needed. He just believed that he knew better than the public, and if we could just hang in there we'd see his side."

As anti-road pressure mounted, the usually resolute department began to splinter inside, the former employees say.

At one point, Mr. Moreland sought advice from his top aides.

"This is a group of hard-core highway men, a group of men who really believe in building roads," the former employee says. "They virtually unanimously voted to drop it.

"This all came at a time when the department was trying to re-establish a reputation of working with neighborhoods rather than ramming roads through where they weren't wanted," the former employee says. "All that seemed to be vanishing."

Additionally, some employees were disturbed by the department's handling of traffic projections — a process described by one former employee as "sausage making."

"This presented real professional problems for people in [the department]," another former employee says. "They were being asked to lie."

The department also boosted assessments of congestion at key intersections in the corridor by measuring traffic jams when the Highland Avenue bridge was out or DeKalb Avenue was closed for repairs, the former employees say.

Mr. Moreland, now in private business, refuses to discuss his role in the parkway. "I've said all I need to say about the Presidential Parkway," Mr. Moreland said recently as he canceled an interview with the Journal-Constitution. "I've been bloodied enough by it."

Other past and present department officials deny the numbers were buoyed. They also deny that Mr. Moreland lost the support of his top staff members.

"That's not my recollection of it," Mr. Rives says. "Yes, there was some [opposition]. At one time Tom convened a group of his senior managers, and says all this is going on and should we continue. The consensus . . . was to proceed."

The department's projections have withstood rigorous court review and have been corroborated by the Atlanta Regional Commission (ARC), which has endorsed the road, he says.

ARC officials, however, now say their endorsement was based more on the political support for the parkway rather than on its superiority to other possible transportation solutions.

Mr. Rives believes the parkway eventually should carry about 35,000 cars a day, taking them off neighborhood streets that now must act as major arteries and diverting traffic away from accident-prone Ponce de Leon Avenue.

However, doubts about the veracity of the projections — and consequently the validity of the environmental impact statement — linger among parkway opponents.

Dwindling traffic counts on the seven major roads in the parkway corridor tend to support their contention that the road is unnecessary.

Between 1979, the year the MARTA east rail line opened, and fall 1987, traffic in the corridor has dropped about 5.5 percent, from 89,395 vehicle trips a day to 84,527, city Bureau of Traffic and Transportation counts show.

The Carter Center, once projected to attract more than 1 million visitors a year, had only about 190,000 visitors in fiscal 1987.

If there were an "unambiguous greater public good" that would come from the road, neighborhood resistance would soften, Mr. Ossoff says.

City officials admit they accepted the state DOT's projections without much question. "In order to get the land we had to meet some reasonable transportation purpose," Mayor Young says. "So there had to be a road to get the land — whether we needed it or not."

After Mr. Moreland said he would let the city control development of the adjacent land, Mayor Young asked architect Paul Muldawer, a longtime friend of the mayor's, to craft a plan that would make the parkway palatable to the neighborhoods while putting the remaining acreage to good use.

Mr. Muldawer designed what came to be known as the "Mayor's Plan," which includes 700 new housing units north and south of the Carter Center and an elaborately landscaped four-lane road.

Mr. Muldawer, who has been paid $200,000 as a DOT consultant on the project, believes his getting a role in the project is a major — albeit rarely recognized — victory for the neighborhoods.

"The DOT took a tremendous step in having a person like myself, with my credentials and my capabilities, design this," Mr. Muldawer says. "That's a very progressive — if not radical — move on their part.

"It's going to be a work of art and a thing of beauty and a parkway in the spirit of Frederick Law Olmsted," Mr. Muldawer says.

Invoking the Olmsted name infuriates parkway opponents.

"To suggest that the Frederick Olmsted parks need additional tinkering is preposterous," says state Rep. Mary Margaret Oliver, who was elected to the House largely on her staunch anti-road stance.

Furthermore, neighborhood activists consider Mr. Muldawer's design a Trojan horse with plans for the completion of the Stone Mountain Freeway lurking in its belly.

They worry that once Ponce de Leon is widened to Clifton Road, the state will push to widen the final mile to Scott Boulevard — essentially completing the Stone Mountain Freeway.

"They say that, but that's a red herring," Mr. Rives says. "Sure I want to connect them. It ought to be built, but I'm not going to do it."

Mr. Rives stops short of promising the freeway would never be completed. "We refrain from saying that it would never be done; that would be a facetious statement on our part," he says. "I'm 62 years old, I can't speak for my successors, and I would be wrong to."

The best protection for the neighborhoods would be to allow the parkway to be built, Mayor Young says.

"Designing a parkway for a presidential library and turning it over to the National Park Service is probably the surest guarantee against that becoming an expressway," says the mayor, who is negotiating with Congress to get park service supervision.

However, the neighborhoods are still stinging from Mayor Young's 1981 post-election reversal of his anti-parkway stand and his standing by while the DOT erased conditions imposed in the mayor's 1982 parkway plan.

Although the state will ban 18-wheel trucks from the parkway and the city intends to enforce a 35-mph speed limit, the state transportation board dumped all the City Council's restrictions on the road's design — including a four-way intersection with a traffic light at Moreland Avenue instead of an overpass.

This kind of intersection would have made it nearly impossible for the DOT to come back and transform the road into a full-fledged freeway. However, DOT officials say the overpass was required because an intersection would have generated too much air pollution.

"Our community does not have a high level of trust in the DOT," Ms. Oliver says.

Mayor Young believes parkway opponents blocked redevelopment of the land, keeping it off the tax rolls.

"These folk have done serious damage to their own community by this lack of faith and lack of trust in anybody except themselves," he says.

"We would have had 700 units of housing built by now if it hadn't been for this lawsuit. It's a kind of minority tyranny," says Mayor Young, who believes the opponents have intentionally ignored neighborhood support for the project, particularly in the Old Fourth Ward.

"This is a fight of basically true believers who've forgotten what it is they started out fighting for," says Mayor Young, who compared parkway opponents to the anti-abortion protesters who spent the past month filling the city jail.

However, Ms. Oliver says it is parkway supporters — not its opponents — who are the obstructionists.

"The number of people who really want this road dwindles by the day," she says. "I don't believe that the politicians that have fought this road for years are going to say, 'Oh well, we tried.' There will be created a political forum to stop this road."

Beginning in 1974, several development plans for the Great Park were produced, but nothing happened until 1981, when Mr. Carter returned to Georgia fresh from his defeat to President Reagan.

The land now occupied by the Carter Center lies in what would have been the intersection of the defunct freeways. The center obtained the 3.1 acres where the buildings sit in a land swap with the DOT and has a state permit to operate and maintain the remaining 27 acres as a highway roadside park, Mr. Rives says.

Mr. Carter, who has attempted vainly to remain above the fray, believes the parkway would enhance the center and neighborhoods by which it will pass, says Terrence B. Adamson, the attorney who represents the former president and his center.

"That's one of the strange ironies: Who's closer to that parkway as a neighbor than us?" Mr. Adamson says. "We're not going to spend $4 million on landscaping and building a beautiful park with lakes and gardens that all the people in the neighborhoods and citizens of the city can enjoy and surround it with something that's not in keeping with that."

Because the land originally was condemned for freeways, state law requires that it be used either for a transportation project or offered back to its original owners, Mr. Adamson says. If the road isn't built, he says, the center would lose its legal claim to the land.

However, Mr. Ossoff scoffs at the notion that the road still needs to be built to protect the center. "I want you to imagine a scenario in which bulldozers are creeping up over the hill to plow under Mr. Carter's $4 million of landscaping and fill in the lakes and plow under the Japanese garden and kill the carp flown in on Japan Air Lines," he says.

The legal problem of saving the center while killing the road is merely technical, he says. For example, the Legislature could declare the center a park and turn it over to the state Department of Natural Resources for management.

Mr. Adamson argues that Mr. Carter can deal only with what the law now says. "This is a nation of laws; President Carter is a man of laws," he says.

Opponents say laws can be changed, and were when road supporters needed the Legislature to give the DOT a legal tool — the state Condemnation Commission — to condemn city parkland.

Road opponents also believe Mr. Carter, whom many of them admire, would be more flexible if he had not been forced into a political corner by Mr. Moreland's insistence on building the road.

Mr. Moreland often is portrayed by road opponents as a Captain Ahab corrupted by the reckless pursuit of his own Great White Whale.

The former DOT employees interviewed by the Journal-Constitution see Mr. Moreland less harshly — they see him, rather, as a talented leader convinced of his own skills and impatient with those who impeded him.

"Mr. Moreland wanted this roadway badly,"

• • •

former employee close to the project says. "He saw it as a roadway that was clearly needed. He just believed that he knew better than the public, and if we could just hang in there we'd see his side."

As anti-road pressure mounted, the usually resolute department began to splinter inside, the former employees say.

At one point, Mr. Moreland sought advice from his top aides.

"This is a group of hard-core highway men, a group of men who really believe in building roads," the former employee says. "They virtually unanimously voted to drop it.

"This all came at a time when the department was trying to re-establish a reputation of working with neighborhoods rather than ramming roads through where they weren't wanted," the former employee says. "All that seemed to be vanishing."

Additionally, some employees were disturbed by the department's handling of traffic projections — a process described by one former employee as "sausage making."

"This presented real professional problems for people in [the department]," another former employee says. "They were being asked to lie."

The department also boosted assessments of congestion at key intersections in the corridor by measuring traffic jams when the Highland Avenue bridge was out or DeKalb Avenue was closed for repairs, the former employees say.

Mr. Moreland, now in private business, refuses to discuss his role in the parkway. "I've said all I need to say about the Presidential Parkway," Mr. Moreland said recently as he canceled an interview with the Journal-Constitution. "I've been bloodied enough by it."

Other past and present department officials deny the numbers were hyped. They also deny that Mr. Moreland lost the support of his top staff members.

"That's not my recollection of it," Mr. Rives says. "Yes, there was some [opposition]. At one time Tom convened a group of his senior managers, and says all this is going on and should we continue. The consensus … was to proceed."

The department's projections have withstood rigorous court review and have been corroborated by the Atlanta Regional Commission (ARC), which has endorsed the road, he says.

ARC officials, however, now say their endorsement was based more on the political support for the parkway rather than on its superiority to other possible transportation solutions.

Mr. Rives believes the parkway eventually should carry about 35,000 cars a day, taking them off neighborhood streets that now must act as major arteries and diverting traffic away from accident-prone Ponce de Leon Avenue.

However, doubts about the veracity of the projections — and consequently the validity of the environmental impact statement — linger among parkway opponents.

Dwindling traffic counts on the seven major roads in the parkway corridor tend to support their contention that the road is unnecessary.

Between 1979, the year the MARTA east rail line opened, and fall 1987, traffic in the corridor has dropped about 5.5 percent, from 89,365 vehicle trips a day to 84,327, city Bureau of Traffic and Transportation counts show.

The Carter Center, once projected to attract more than 1 million visitors a year, had only about 100,000 visitors in fiscal 1987.

If there were an "unambiguous greater public good" that would come from the road, neighborhood resistance would soften, Mr. Ossoff says.

City officials admit they accepted the state DOT's projections without much question. "In order to get the land we had to meet some reasonable transportation purpose," Mayor Young says. "So there had to be a road to get the land — whether we needed it or not."

After Mr. Moreland said he would let the city control development of the adjacent land, Mayor Young asked architect Paul Muldawer, a longtime friend of the mayor's, to craft a plan that would make the parkway palatable to the neighborhoods while putting the remaining acreage to good use.

Mr. Muldawer designed what came to be known as the "Mayor's Plan," which includes 700 new housing units north and south of the Carter Center and an elaborately landscaped four-lane road.

Mr. Muldawer, who has been paid $200,000 as a DOT consultant on the project, believes his getting a role in the project is a major — albeit rarely recognized — victory for the neighborhoods.

"The DOT took a tremendous step in having a person like myself, with my credentials and my capabilities, design this," Mr. Muldawer says. "That's a very progressive — if not radical — move on their part.

"It's going to be a work of art and a thing of beauty and a parkway in the spirit of Frederick Law Olmsted," Mr. Muldawer says.

Invoking the Olmsted name infuriates parkway opponents.

"To suggest that the Frederick Olmsted parks need additional tinkering is preposterous," says state Rep. Mary Margaret Oliver, who was elected to the House largely on her staunch anti-road stance.

Furthermore, neighborhood activists consider Mr. Muldawer's design a Trojan horse with plans for the completion of the Stone Mountain Freeway lurking in its belly.

They worry that once Ponce de Leon is widened to Clifton Road, the state will push to widen the final mile to Scott Boulevard — essentially completing the Stone Mountain Freeway.

"They say that, but that's a red herring," Mr. Rives says. "Sure I want to connect them. It ought to be built, but I'm not going to do it."

Mr. Rives stops short of promising the freeway would never be completed. "We refrain from saying that it would never be done; that would be a facetious statement on our part," he says. "I'm 62 years old, I can't speak for my successors, and I would be wrong to."

The best protection for the neighborhoods would be to allow the parkway to be built, Mayor Young says.

"Designing a parkway for a presidential library and turning it over to the National Park Service is probably the surest guarantee against that becoming an expressway," says the mayor, who is negotiating with Congress to get park service supervision.

However, the neighborhoods are still stinging from Mayor Young's 1981 post-election reversal of his anti-parkway stand and his standing by while the DOT erased conditions imposed in the mayor's 1982 parkway plan.

Although the state will ban 18-wheel trucks from the parkway and the city intends to enforce a 35-mph speed limit, the state transportation board dumped all the City Council's restrictions on the road's design — including a four-way intersection

TESTIMONY BEFORE

HOUSE COMMITTEE ON PUBLIC WORKS
AND TRANSPORTATION

ATLANTA, GEORGIA

BY: HAL RIVES, COMMISSIONER, GEORGIA
DEPARTMENT OF TRANSPORTATION

MR. CHAIRMAN, MEMBERS OF THE COMMITTEE, WELCOME TO GEORGIA. IT IS AN HONOR AND A REAL PLEASURE FOR ME TO APPEAR BEFORE YOU AND TALK ABOUT TRANSPORTATION ISSUES FACING GEORGIA.

FIRST, I WANT TO SPEAK BRIEFLY ABOUT THE FEDERAL DBE PROGRAM.

THE DEPARTMENT PRESENTLY HAS 235 FIRMS CERTIFIED AS DISADVANTAGED BUSINESS ENTERPRISE. OF THAT NUMBER 177 ARE CONTRACTORS, 4 ARE CONSULTANTS AND 18 ARE SUPPLIERS.

THE DEPARTMENT ALSO HAS 98 FIRMS CERTIFIED AS WOMEN'S BUSINESS ENTERPRISE, 75 CONTRACTORS, 7 CONSULTANTS, AND 16 SUPPLIERS.

SINCE 1975 THE DEPARTMENT HAS BEEN COMMITTED TO MINORITY AND FEMALE BUSINESS PARTICIPATION IN ITS CONSTRUCTION PROGRAMS. THE PRESENT DBE GOAL IS 10% PARTICIPATION ON FEDERALLY FUNDED CONSTRUCTION WORK. IN FY 88 OUR OVERALL DBE PERCENTAGE WAS 10.9. IT WAS 10.75 PERCENT IN FY 89 AND IS PROJECTED TO BE 11.2 PERCENT IN THE CURRENT YEAR.

ALTHOUGH THE DEPARTMENT IS PROUD OF ITS ACHIEVEMENTS WITH THE DISADVANTAGED BUSINESS ENTERPRISE PROGRAM, WE HAVE EXPERIENCED AN ALARMING TREND IN THE STATE OF GEORGIA THAT CONTINUES TO MANIFEST ITSELF YEARLY. THIS TREND WAS CAUSED BY THE MERGING OF THE MINORITY BUSINESS ENTERPRISE AND THE WOMEN BUSINESS ENTERPRISE PROGRAM INTO ONE DISADVANTAGED BUSINESS ENTERPRISE PROGRAM. IN THIS STATE, WHICH HAS A LARGE BLACK POPULATION, THE TREND IS ALARMING AND WE FEEL THAT SOME REMEDIAL ACTION IS CALLED FOR.

THE TREND IS THAT THE VOLUME OF CONTRACTING AND SUBCONTRACTING WITH MINORITY BUSINESS ENTERPRISE IS DECREASING WHILE IT IS INCREASING WITH WOMEN BUSINESS ENTERPRISE. TO ILLUSTRATE THIS POINT, AFTER THE GOALS WERE COMBINED, IN 1988 MINORITY BUSINESSES RECEIVED 8.8% OF THE WORK WHILE 3.4% WENT TO WOMEN'S BUSINESSES. IN 1989 6.2% WENT TO MINORITIES AND 4.3% WENT TO FEMALES. TO DATE IN 1990, 5.7% HAS GONE TO MINORITIES AND 6.3% HAS GONE TO FEMALES.

AS YOU CAN SEE, THIS TREND CONTINUES AND WE FEEL THAT IF THE GOALS ARE NOT SEPARATED, AS THEY WERE PREVIOUSLY, THIS WILL HAVE SERIOUS REPERCUSSIONS. WITH THIS IN MIND, WE RESPECTFULLY REQUEST THAT CONSIDERATION BE GIVEN TO ONCE AGAIN SEPARATING THE GOALS.

LET ME NOW TURN TO THE SUBJECT OF URBAN CONGESTION.

GEORGIA HAS GENERALLY OUT-PERFORMED THE NATION IN CERTAIN GROWTH

RATES OVER THE LAST TWO DECADES. THE ENGINE WHICH POWERED THIS GROWTH HAS BEEN, AS YOU MIGHT EXPECT, THE ATLANTA REGION. PROSPECTS FOR THE FUTURE ARE JUST AS OPTIMISTIC. IT IS FORECAST THAT THE ATLANTA REGION WILL ADD 1.6 MILLION MORE PEOPLE BY THE YEAR 2010 TO REACH A TOTAL OF 3.8 MILLION.

HOWEVER, THE EXUBERANCE WHICH HAS ACCOMPANIED THESE "BOOM YEARS" TENDS TO OVER-SHADOW WHAT HAS BEEN LEFT IN ITS PATH; A LEGACY OF OVERBURDENED WATER AND SEWER SYSTEMS, AND TRAFFIC JAMS. WHILE THE POPULATION OF THE ATLANTA REGION HAS MORE THAN DOUBLED SINCE 1960, VEHICLE MILES OF TRAVEL HAVE MORE THAN TRIPLED AND CAN BE EXPECTED TO NEARLY TRIPLE AGAIN BY THE YEAR 2010.

THE FREEWAY SYSTEM IN ATLANTA IS EXPECTED TO BEAR THE BRUNT OF THIS INCREASED TRAVEL. AS IN OTHER MAJOR METROPOLITAN AREAS, ATLANTA'S FREEWAYS HAVE BECOME OUR URBAN MOBILITY CORRIDORS. WITH GROWTH EXPLODING IN THE SUBURBS, PARTICULARLY ALONG ATLANTA'S NORTHERN TIER OF COUNTIES, DAILY TRAFFIC VOLUMES ON THE NORTHERN

ARC OF ATLANTA'S PERIMETER HIGHWAY, I-285, ARE EXCEEDING 220,000 VEHICLES PER DAY. EVEN WITH OUR EXPANDED INTERSTATE SYSTEM, THESE VOLUMES ARE PRODUCING SEVERE PEAK-PERIOD CONGESTION ON ATLANTA'S FREEWAYS, PARTICULARLY ALONG THE NORTHERN SECTIONS OF THE PERIMETER AND RADIAL INTERSTATES.

THE DEPARTMENT HAS BEEN EXAMINING WAYS TO ATTACK THE CONGESTION PROBLEM. WE HAVE BEEN MOST SUPPORTIVE OF MARTA'S EFFORT TO EXTEND THEIR RAIL SYSTEM INTO COBB AND GWINNETT COUNTIES, AND WE ARE JOINTLY WORKING ON A RAIL-HIGHWAY PROJECT IN THE GEORGIA 400 CORRIDOR. BUT DUE TO THE DIVERSITY OF THE SUBURB-TO-SUBURB COMMUTE TRIPS, WE KNOW THAT TRANSIT ALONE CAN NOT SOLVE THE PROBLEM. THE DEPARTMENT IS EVALUATING THE FEASIBILITY OF ADDING A COLLECTOR-DISTRIBUTOR ROAD SYSTEM PARALLEL TO THE CONGESTED SECTIONS ON OUR NORTHERN PERIMETER AND RADIAL INTERSTATES AND FREEWAYS. THE ESTIMATED COST FOR THIS COLLECTOR-DISTRIBUTOR SYSTEM IS $1.5 BILLION.

BUT THAT'S ONLY PART OF THE STORY. IT IS ESTIMATED THAT AN ADDITIONAL $1.9 BILLION WILL BE NEEDED FOR INTERSTATE IMPROVEMENTS IN GEORGIA OVER THE NEXT 20 YEARS. MANY OF THESE IMPROVEMENTS WILL BE NEEDED IN ATLANTA TO PROVIDE ADDITIONAL CAPACITY TO PRESERVE THE EFFICIENCY AND SAFETY OF THE FREEWAY SYSTEM.

OVER THE NEXT TEN YEARS, WE FORESEE THE NEED FOR SIGNIFICANT INCREASES IN THE STATE INVESTMENT IN OTHER MODES. WE WILL NEED TO INCREASE ANNUAL STATE SPENDING BY MORE THAN 120 PERCENT FOR PUBLIC TRANSPORTATION PROGRAMS. AND OVER 500 PERCENT FOR THE STATE'S SHARE OF AIRPORT IMPROVEMENTS.

INCLUDED IN THOSE PROGRAMS WILL BE $50.2 MILLION FOR RAIL BANKING - PRESERVING ABANDONED RAIL CORRIDORS FOR FUTURE USE AS COMMUTER RAIL CORRIDORS OR ROADWAYS. AND $38.6 MILLION FOR PORT EXPANSION AND CHANNEL DEEPENING.

THIS DOES NOT INCLUDE A MAJOR NEW HUB AIRPORT, WHICH WILL BE

NEEDED BECAUSE OF CONGESTION AT ATLANTA'S HARTSFIELD INTERNATIONAL. GEORGIA WILL NEED BOTH PASSENGER AND CARGO FACILITIES. WE ESTIMATE THE START-UP COSTS TO BE ABOUT $750 MILLION. WE ALSO SEE A NEED TO LINK THE NEW AIRPORT TO HARTFIELD WITH A HIGH SPEED RAIL LINE.

I WANT TO IMPRESS UPON YOU THE FACT THAT NEITHER WE NOR ANY OTHER STATE CAN MEET OUR NEEDS ALONE. THE FEDERAL/STATE PARTNERSHIP THAT HAS SERVED US SO WELL IS CRITICAL TO OUR FUTURE.

THE FEDERAL BUDGET COMMITMENT FOR TRANSPORTATION MUST ALSO INCREASE. I STRONGLY SUPPORT THE AASHTO RECOMMENDATION FOR INCREASING FEDERAL HIGHWAY FUNDING FROM $17.6 BILLION IN FISCAL YEAR 1992 To $25.9 BILLION IN FISCAL YEAR 1995. AND INCREASING FEDERAL TRANSIT CAPITAL FUNDING FROM $3.2 BILLION TO $5.0 BILLION OVER THE SAME PERIOD.

I BELIEVE WE MUST TAKE STEPS NOW TO INVEST IN OUR FUTURE.

THANK YOU MR. CHAIRMAN

Department of Transportation
State of Georgia

The Honorable Glenn M. Anderson, Chairman
Committee on Public Works and Transportation
U.S. House of Representatives
Room 2165 Rayburn House Office Building
Washington, D.C. 20315

Dear Mr. Anderson:

At a hearing of your Committee in Atlanta, Georgia, on August 9, 1990, I gave testimony regarding the MBE program and other issues related to our transportation programs.

Preceding my testimony, Mr. Richard Ossoff, representing a group known as CAUTION, testified in opposition to the proposed Presidential Parkway project in Atlanta. I responded to that very briefly during the hearing. I also responded to some questions which were raised by the Committee. The testimony by CAUTION was unexpected, however, so I was not prepared to answer the points which they raised in any detail. At my request, you graciously agreed that a more complete response be included in follow-up written testimony.

Attached is additional information regarding the proposed Presidential Parkway, which I request be included in the record of the Atlanta hearing. We are delinquent in getting this to you, but I trust that it can still be made part of the record.

Thank you for your continued efforts on behalf of our transportation programs.

Yours very truly,

Hal Rives
Commissioner

1946 LOCHNER REPORT

ADDITIONAL TESTIMONY OF HAL RIVES, COMMISSIONER OF GEORGIA DEPARTMENT OF TRANSPORTATION REGARDING QUESTIONS RAISED BY CHAIRMAN ANDERSON CONCERNING PRESIDENTIAL PARKWAY.

BEFORE THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE OF THE UNITED STATES HOUSE OF REPRESENTATIVES

ATLANTA, GEORGIA
AUGUST 9, 1990.

THE FOLLOWING INFORMATION IS IN ADDITION TO MY ANSWERS GIVEN TO YOU ON AUGUST 9, 1990 IN REPLY TO YOUR QUESTIONS CONCERNING THE PRESIDENTIAL PARKWAY AND TESTIMONY GIVEN BY REPRESENTATIVES OF C.A.U.T.I.O.N.

ATLANTA, BECAUSE OF ITS LOCATION, IS A HUB FOR THE WHOLE SOUTHEAST FOR RAIL, ROADS AND AIR TRANSPORTATION. THIS IS THE BASIS FOR IT BECOMING THE GREAT CITY IT CURRENTLY IS AND THE BASIS FOR ITS POTENTIAL GROWTH TO ONE OF THE MAJOR CITIES IN THE WORLD IN THE NEXT TWENTY TO FIFTY YEARS.

A HISTORY OF THE DEVELOPMENT OF THE CITY OF ATLANTA SINCE 1950 IS A STORY OF ITS TRANSPORTATION IMPROVEMENTS. THIS BEGAN WITH THE LOCHNER REPORT COMPLETED IN 1946 WHICH RECOMMENDED A FREEWAY SYSTEM. THIS SYSTEM IS CURRENTLY THE FREEWAY SYSTEM IN PLACE, EXCEPT FOR THE PRESIDENTIAL PARKWAY CORRIDOR. THE NEED FOR A MAJOR ROADWAY IN THE AREA OF THE PRESIDENTIAL PARKWAY WAS RECOGNIZED AS EARLY AS 1946 (SEE ATTACHED COPIES OF MAPS). THE EXPRESSWAY SYSTEM WAS BEGUN BASED ON THE LOCHNER REPORT, AND MAJOR PORTIONS OF THE SYSTEM WERE PLACED UNDER CONSTRUCTION THRU A JOINT EFFORT OF CITY OF ATLANTA, FULTON COUNTY AND THE THEN GEORGIA HIGHWAY DEPARTMENT. THE YEAR 1956 BROUGHT ABOUT THE INCORPORATION OF THE FREEWAY SYSTEM COMPLETED AND UNDER WAY INTO THE INTERSTATE HIGHWAY PROGRAM.

THE FREEWAY BETWEEN BROOKWOOD STATION AND DOWNTOWN ATLANTA WAS MADE A COMBINED ROUTE OF I-75 AND I-85 AND I-20 WAS ADDED TO THE SYSTEM. THE ROADWAY FROM I-75/I-85 ALONG THE ROUTE OF THE PRESIDENTIAL PARKWAY WAS NOT INCLUDED IN THE INTERSTATE SYSTEM.

HOWEVER, AN INTERCHANGE FOR IT WAS PROVIDED. THE FREEWAY SYSTEM IN DOWNTOWN ATLANTA WAS COMPLETED IN THE EARLY 1960'S. DOWNTOWN, AS A RESULT OF IMPROVED TRAFFIC CAPACITY, ON THE NEW FREEWAY SYSTEM, GREW RAPIDLY, AND BY THE LATE 1960'S WAS BECOMING CONGESTED. THE ORIGINAL SYSTEM HAD A MAJOR MISTAKE IN IT AS IT COMBINED I-85 AND I-75 ONTO ONE ROADWAY THRU THE DOWNTOWN AREA. YOU HAD TWO MAJOR FREEWAYS OF 4 LANES EACH FEEDING A SIX LANE COMBINATION ROUTE. THIS DID NOT WORK. A NEW PLAN WAS DEVELOPED AND ADDED TO THE SYSTEM IN 1964. THIS HAD A ROUTE CALLED I-485 WHICH TIED INTO WHAT WAS CALLED THE STONE MOUNTAIN FREEWAY, (LOCATED WHERE THE CURRENT PRESIDENTIAL PARKWAY IS PROPOSED.) AND OTHER ROUTES WHICH WOULD HAVE PROVIDED A COMPLETE FREEWAY SYSTEM FOR THE ATLANTA AREA. THE DEPARTMENT HAD I-485 AND MANY OF THE OTHER ROADS UNDERWAY OR READY TO LET TO CONTRACT WHEN THEY WERE CAUGHT UP IN THE 1970 NATIONAL ENVIRONMENTAL PROTECTION ACT. AS A RESULT OF THIS ACT AND COURT SUITS OVER THE PROJECTS, I-485 AND STONE MOUNTAIN FREEWAY WERE WITHDRAWN FROM THE PLAN IN 1975. THE RIGHT OF WAY FOR THESE PROJECTS HAD BEEN BOUGHT AND MOST ALL HOMES CLEARED. THE DROPPING OF THIS SYSTEM CAUSED A DRASTIC CHANGE IN THE DEVELOPMENT OF THE CITY. INSTEAD OF THE DOWNTOWN AREA CONTINUING TO GROW, THE NEW DEVELOPMENT WENT IN ALONG I-285 BETWEEN I-75 AND I-85 ON THE NORTH AND ALONG I-75 AND I-85 NORTH OF I-285. THE DOWNTOWN CBD AREA EXPERIENCED A LOSS OF EMPLOYMENT OF 5900 JOBS DURING THE 1970'S BECAUSE OF THE NEW FREEWAYS NOT BEING BUILT. THE DEPARTMENT OF TRANSPORTATION IN THE LATE 1970'S RECOGNIZED WHAT WAS HAPPENING AND BEGAN A PROGRAM OF "FREEING THE FREEWAYS" WHICH INCLUDED IMPROVING ALL OF THE DOWNTOWN FREEWAYS. INCLUDED IN THE RECONSTRUCTION WAS A NEW PARKWAY, CALLED THE PRESIDENTIAL PARKWAY, WHICH WAS TO SERVE THE NORTHEAST CORRIDOR WHICH HAD LONG BEEN NEGLECTED. MAYOR ANDREW YOUNG AND THE CITY OF ATLANTA DEVELOPED THE PLAN WHICH INCORPORATED PRESIDENT CARTER'S LIBRARY INTO THE DESIGN. THIS PROJECT WENT THRU THE PLANNING, ENVIRONMENTAL AND OTHER REQUIREMENTS AND WAS PLACED UNDER CONSTRUCTION. A SERIES OF LAW SUITS WERE BROUGHT BY THE OPPOSITION TO THE PROJECT. A FEDERAL LAW SUIT WAS BROUGHT AGAINST THE PROJECT'S 4 F STATEMENT SAYING

THE DEPARTMENT DID NOT CORRECTLY EVALUATE THE PROJECT ALTERNATIVES. THE COURTS DECIDED WE HAD TO REVALUATE ALTERNATIVES, TO AVOID THE USE OF 4 F PROPERTIES AND INCLUDE ALL POSSIBLE PLANNING TO MINIMIZE HARM. THE DEPARTMENT DID A RESTRUCTURING OF ITS 4 F EVALUATION AND AFTER RESUBMITTING GAINED APPROVAL OF THE COURTS WHICH STATED IN THEIR RULING: (1) THERE IS A NEED FOR THE PRESIDENTIAL PARKWAY (2) THAT THE NEED CANNOT BE SERVED WITHOUT SOME IMPACT ON HISTORICAL PARK PROPERTY AND (3) THAT THE PROPOSED PROJECT AS PLANNED MINIMIZED THESE IMPACTS. ANOTHER SUIT WAS BROUGHT IN STATE COURT QUESTIONING THE STATES POWER TO CONDEMN CITY PARK LAND. THIS WAS UPHELD BY THE COURT. A NEW LAW WAS PASSED BY THE STATE TO CORRECT THE DEFICIENCY IN THE LAW AND THIS LAW WAS ALSO QUESTIONED AGAIN BY THE OPPOSITION. THIS IS CURRENTLY IN THE APPEALS PROCESS IN THE COURTS AWAITING A RULING.

THE PROJECT AS PROPOSED PROVIDES A PARKWAY WITH EXTENSIVE LANDSCAPING, PLAYGROUNDS, JOGGING AND BICYCLE PATHS AND PICNIC AREAS. IT DOES NOT TAKE ANY HOUSES. THIS PROJECT WOULD GREATLY ENHANCE THE AREA. THE PROJECT ESTIMATED CONSTRUCTION COST IS $29,000,000.

THERE CURRENTLY EXISTS A PROBLEM OF COMMUTER TRAFFIC FLOWING THROUGH THE RESIDENTIAL STREETS OF THE COMMUNITY. THE CONSTRUCTION OF THE PRESIDENTIAL PARKWAY WILL PROVIDE A GOOD ARTERIAL STREET TO MOVE THE TRAFFIC OUT OF THE NEIGHBORHOOD STREETS AND ONTO A GOOD ARTERIAL WHERE IT WILL FLOW SMOOTHER AND SAFER.

ONE OF THE OPPOSITION'S MAJOR OBJECTIONS TO THE PROJECT IS THAT TRAFFIC GROWTH DOES NOT SHOW A NEED. THEY SAY THERE HAS NOT BEEN A SIGNIFICANT INCREASE IN TRAFFIC IN THE AREA. THE TRAFFIC DID NOT INCREASE GREATLY IN THE PERIOD FROM 1970 TO 1980 DUE TO LOSS OF EMPLOYMENT IN THE CBD. HOWEVER, THIS HAS CHANGED IN THE 1980'S WITH TRAFFIC GROWING ON PONCE DE LEON FROM 25,000 TO 33,000 VPD AT THE SCOTT BOULEVARD INTERSECTION.

PRESIDENTIAL PARKWAY IS A REGIONAL PROJECT WHICH IS A PART OF THE REGIONAL PLAN FOR THE METROPOLITAN AREA THAT HAS BEEN DEVELOPED BY THE ATLANTA REGIONAL COMMISSION (ARC) THRU THE PLANNING PROCESS. IT HAS THE ENDORCEMENT OF THE MEMBERS. IT HAS HAD AN REVALUATION BY THE ARC STAFF THIS YEAR IN WHICH THEY CONTINUED TO SUPPORT THE PROJECT AS ONE WHICH IS NEEDED TO SERVE THE TRIP DEMAND IN THE NORTHWEST CORRIDOR.

SINCE COMPLETION OF RECONSTRUCTION OF THE DOWNTOWN FREEWAY IN THE MID 1980'S, THE CBD HAS GROWN GREATLY. THE WORLD CONGRESS CENTER HAS BEEN BUILT BY THE STATE OF GEORGIA WHICH ATTRACTS TRADE SHOWS. THIS HAS GENERATED A BOOM IN HOTEL CONSTRUCTION. ALSO, THE CITY OF ATLANTA REDEVELOPED UNDERGROUND ATLANTA AS A TOURIST ATTRACTION WITHIN THE CBD. THIS DEVELOPMENT HAS FLOURISHED AND HAS CAUSED A GROWTH IN EMPLOYMENT IN THE 1980'S WHICH HAS CREATED 14,000 NEW JOBS. WHILE THIS IS SMALL IN RELATION TO THE 461,000 JOBS INCREASE IN THE REGION, IT IS AN INDICATION THAT PROVIDING IMPROVED TRANSPORTATION WILL STIMULATE GROWTH. WITH ADDITION OF THE PRESIDENTIAL PARKWAY TO SERVE THE NORTHEAST CORRIDOR WHICH IS CURRENTLY NOT SERVED BY AN ADEQUATE TRANSPORTATION SYSTEM, ADDITIONAL BENEFITS WOULD OCCUR TO THE CBD AND REGION. ALL CITIZENS WOULD THEN HAVE ADEQUATE ACCESS TO THE MAJOR FACILITIES WHICH ATTRACT PEOPLE TO THE CBD.

A SUMMATION OF MY ADDITIONAL TESTIMONY.

1). THERE IS A NEED FOR THE PRESIDENTIAL PARKWAY. THE NEED WAS ESTABLISHED AS EARLY AS 1946. IT HAS BEEN REAFFIRMED AND HAS BEEN VALIDATED BY THE U. S. COURT OF APPEALS.

2). THE CITY OF ATLANTA GOVERNMENT UNDER MAYOR YOUNG DEVELOPED AND ENDORSED THE CURRENT PLAN FOR THE PRESIDENTIAL PARKWAY.

3). THE PROJECT HAS THE ENDORCEMENT OF THE ATLANTA REGIONAL COMMISSION AND HAS BEEN THRU THE COMPLETE PLANNING PROCESS.

4). THE DEPARTMENT AND MARTA HAVE IMPLEMENTED SIGNIFICANT TRANSPORTATION IMPROVEMENTS TO SERVE THE CENTRAL BUSINESS DISTRICT. THIS HAS STARTED A PROCESS OF A COMEBACK FOR THIS

AREA. THIS HAS CAUSED TRAFFIC GROWTH IN THE NORTHEAST CORRIDOR.

5). WITH THE ADDITION OF THE PRESIDENTIAL PARKWAY TO SERVE THE AREA TO THE NORTHEAST WHICH IS CURRENTLY NOT SERVED BY AN ADEQUATE TRANSPORTATION SYSTEM, ADDITIONAL BENEFITS WOULD OCCUR TO THE CBD AND REGION. ALL CITIZENS WOULD THEN HAVE ADEQUATE ACCESS TO THE MAJOR FACILITIES WHICH ATTRACT PEOPLE TO CBD.

6). WE NEED TO CONTINUE OUR CURRENT PROGRAMS SO THAT THE DOWNTOWN AREA WILL CONTINUE TO BE A VIABLE AND HEALTHY AREA OF THE CITY.

ATLANTA, GEORGIA 30332

THE UNITED STATES HOUSE OF REPRESENTATIVES
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
HEARINGS ON THE INFRASTRUCTURE NEEDS OF THE FIFTH
CONGRESSIONAL DISTRICT OF GEORGIA

AUGUST 8, 1990

We are confronted everywhere with the reality that our infrastructure has suffered from a lack of attention. The characteristics of this neglect are inadequate maintenance, poor management and insufficient budgeting for re-capitalization of the infrastructure. Over the last thirty years public works investment as a percent of GNP has declined from 2.5% to less than half that rate today. As a result, a crises now looms at a time when the nation is least prepared to finance infrastructure reinvestment. Local areas are being forced increasingly to assume the responsibility for the cost of these vital facilities. We find ourselves in this situation nationally and in the Fifth Congressional District of Georgia.

While making decisions on the effectiveness and efficiency of infrastructure, it is important to consider the issue of infrastructure investment in the broadest context possible. Clearly there is an indisputable link between the existence of sufficient infrastructure and increased productivity, income and development. Therefore, it is important that we integrate cutting-edge technology in new capital investments as we re-capitalize the infrastructure. This will make it more supportive of economic growth and improvements in the quality of life. In short, investment decisions must be driven by a concrete evaluation of the extent to which they accomplish specific objectives. Similarly, the development of standards for monitoring and evaluating infrastructure must be tied to investment decisions.

The specific infrastructure needs of the Fifth Congressional District are identified below:

1. The state of the traffic control infrastructure is woefully inadequate. Everywhere it is characterized by antiquated equipment and technology contributing to congestion and impairing mobility. For example in the City of Atlanta approximately 61 percent of the 817 traffic controllers are more than ten years old, 255 are between ten and twenty years old, 189 are between twenty and thirty years old and 53 are more than thirty years old. As a result the maintenance requirements are extensive thereby occupying the majority of staff time.

   With only 300 of the 817 signals under direct computer control, the present system is nearing its maximum ability to expand its communication channels. This means there are 517 signalized intersections operating independently as smaller systems in an isolated mode.

   The growth the City has experienced has placed additional demand on the roadway infrastructure making the upgrade of the system mandatory. The implementation of a traffic control system will take approximately 10 years at a cost of approximately $39,000,000.00.

2. The state of Georgia ranks 11th in the percentage of county bridges in need of repair with 3,200 bridges in the state having structural problems. This is generally of one-third of the bridges maintained by counties and cities. Bridges and viaducts needing immediate attention in the City of Atlanta total approximately $29,000,000.00.

3. The 1990-1994 Areawide Capital Improvements Program identifies the need for $750,000,000.00 worth of projects at regionally significant airports in the Atlanta area. There are five publicly owned airports, one proposed airport and two privately owned reliever airports. Of this amount $591,000,000.00 is needed for Hartsfield Atlanta International Airport, $119,000,000.00 for Fulton county Airport and $6,140,000.00 for Dekalb-Peachtree Airport.

   In 1989 Hartsfield was the second busiest airport in the world. In response to this a number of improvements must be made. However it has been determined that these will still leave Hartsfield unable to meet the region's total air carrier needs. Consequently a second airport has been proposed to serve the needs of the regions origin/destination passenger market. Such a facility would enable the region to accommodate the long-term projections for air carrier operations. There is currently an effort underway to better define issues surrounding the location,size, feasibility, financial structures, intermodal connections etc.

4. The continued construction of MARTA is vital to the Fifth Congressional District and to the Atlanta region. Federal requirements mandate an ongoing transportation planning process and the specification of Transportation Improvement Projects (TIP). The total cost of rail construction in the TIP is $509,000,000.00. The total cost of MARTA including rail construction and the transit operations program for fiscal years 1991-1998 is approximately $724,508,000.00.

5. Highway and highway related improvements for the City of Atlanta for the years 1991-1998 listed in the TIP total $109,000,000.00. The improvements primarily consist of the widening of arterials, transportation system management strategies and upgrades. The total for Dekalb County is $134,504,000.00 with more than $35,500,000.00 of that needed for projects in South Dekalb County.

TRAFFIC SIGNAL SYSTEM EVALUATION

IMPLEMENTATION PLAN and ENERGY IMPACTS

Prepared For:

City of Atlanta

Bureau of Traffic and Transportation

Prepared By:

Gray-Yauch & Associates, Inc.
and
Catherine Ross and Associates

October 1989

I. IMPLEMENTATION PLAN

The City of Atlanta is proud to have been one of the first cities in the nation to implement computerized traffic signal control. The existing Traffic Data Acquisition and Control System (TDACS), has paid for itself in gasoline and motorist time savings, as well as reduction in vehicle emissions, many times over. However, after seventeen years, which is exceptional considering the advancements in computer technology, the system has reached the end of its useful life. The Bureau is currently spending the majority of their staff time maintaining the operational status of the system on a day-by-day basis. With the implementation of new hardware and software components, the emphasis can be shifted from maintaining the system, to managing traffic on a daily basis. Traffic control system technology has developed far beyond the Bureau's current system capabilities.

The primary objective of this study was to formulate a computerized traffic control system concept that identified the operational characteristics of a central computer system in conjunction with the electronic control equipment at signalized intersections.

This system evaluation study also included an assessment of the operational conditions of the existing field hardware. The results of the assessment as concluded by the members of the Blue Ribbon Committee, is that the City's traffic signal infrastructure requires widespread intersection upgrade and replacement not only of the electronic equipment which time and coordinate the signals, (of which sixty-one percent exceed ten years of age), but also of the signal mounting poles, wires, and signal heads, which are the basic components of a signal installation. As a result, the City is in the process of establishing a ten year traffic signal modernization program.

The Blue Ribbon Committee also concluded that the existing computerized central traffic control equipment is nearing or in some cases, has exceeded its useful life and should be replaced. Some equipment could be retained through transition to a new system, but should not be integrated into a new system.

It is evident from the recommendations of the Blue Ribbon Committee, that a signalized intersection update and a central computer system update will be required to accomplish the City's goal of expansion and renovation of TDACS. These two objectives can be accomplished by the implementation of: (1) a traffic signal modernization program and; (2) a central computer modernization program. An interrelationship between these two programs exists in that the new computerized traffic control system when installed, will interface with the new controller equipment that will have been installed in the field. Therefore, to minimize the time necessary to accomplish the goal of renovating and expanding TDACS, and produce an early return of accrued benefits to the driving public (i.e. signal coordination), these programs should be implemented concurrently.

CENTRAL COMPUTER MODERNIZATION PROGRAM

The central computer modernization program would consist of the design and installation of a new, technically advanced, central computer traffic control system (Direct Database), based on the recommendations of the Blue Ribbon Committee. The operating staff would establish a traffic systems management program to not only monitor equipment operation and establish traffic flow timing patterns, but also generate timing plans and develop inventory files for maintenance records. The system would also be designed with an open architecture to allow for the integration of additional devices such as Geographic Information Systems (GIS) as well as ramp metering, changeable message signs, and video surveillance for incident detection and management of both the freeways and surface streets. Idealistically, the new traffic control system and management program could be expanded across jurisdictional boundaries.

The new central computer system would be compatible for surveillance and control of the new electronic field equipment to be installed in the traffic signal modernization program. It is estimated that the design, construction, and implementation of the central computer system could be completed within a three to five year time period.

The central computer modernization program is divided into two phases: (1) the central system design and; (2) the construction and installation of the system. The annual funding allocation for this program should be sufficient to allow for construction of the new system to begin upon completion of its design. Program delays occurring between the completion of the design phase, and the start of the construction and installation phase, could result in subsequent design revisions and also render construction cost and scheduling estimates inaccurate.

TRAFFIC SIGNAL MODERNIZATION PROGRAM

The ten year traffic signal modernization program would consist of the potential replacement (subject to engineering review), of all signal related intersection equipment. This would include replacement of controllers and cabinets, detectors, communications equipment, cable, poles, and signal heads where necessary, due to age and/or maintainability.

It is anticipated that the first cycle (ten years) of the traffic signal modernization program would be an intersection renovation or rehabilitation process requiring extensive field construction. The results of this program would contribute to the intersection's visual impact with regard to both improved safety and improved aesthetics. It would also result in the technical upgrade of the electronic intersection components. The costs associated with the traffic signal modernization program have been estimated to comprise approximately eighty-seven percent (87%) of the entire cost for the TDACS expansion and renovation project. Therefore, to complete the expansion and renovation of TDACS, the majority of program funds would be needed to be spent in the field on the traffic signal modernization program. If the traffic signal modernization program is implemented over a ten year period, upon it's completion, future intersection upgrades would be less cost intensive. This would result from the fact that many of the poles, cable, and signal heads that were replaced in the first ten years, would be reusable.

For purposes of this evaluation, an appraisal was conducted of existing field hardware for control systems operating as part of the central system or as part of the numerous small independent systems within the city limits, as well as those intersections operating in a purely isolated mode. This appraisal conducted in the summer of 1989, consisted of an identification of the age of equipment in operation. Seven categories of age were developed as follows:

CATEGORY	AGE OF EQUIPMENT (YEARS)
1	> 30
2	26 - 30
3	21 - 25
4	16 - 20
5	11 - 15
6	6 - 10
7	0 - 5

Based on the results of the review which consisted of discussions with Bureau staff and an update of a previous system expansion study which developed a staged signal implementation plan, the existing systems and isolated intersections were grouped into these seven categories. A summary of the results are provided below. A complete listing of the classification of individual systems is provided in the appendix. A signal system age classification map has also been provided in the appendix.

CATEGORY	NUMBER OF INTERSECTIONS
1	53
2	101
3	88
4	74
5	181
6	169
7	151
TOTAL	817

The total number of signals in these categories includes the 128 pretimed signals in the 5 subareas located downtown that have already been identified for immediate replacement. These signals have been classified as Category 1, 2, or 3.

This information should be utilized as the initial step to prioritize or schedule the upgrade of field hardware throughout the ten year modernization program. Approximately 80 intersections a year should be scheduled for renovation to complete the program within a ten year period. Intersections identified in Categories 1, 2, and 3 should be targeted for renovation within the first three years of the program starting with Category 1 intersections. Intersections identified in Categories 4 and 5 should be targeted for renovation during the subsequent three years, and those intersections classified as Category 6 and 7 should be scheduled for renovation during the last four years of the program.

The scheduling of signal renovations or upgrades should remain somewhat flexible to allow for the ability to accommodate unexpected occurrences such as emergency replacement needs, which could impact the priority schedule. Therefore, an annual review and update of the intersection category listing should be performed. This annual review will allow the Bureau staff to finalize the construction schedule of intersections to be upgraded the following program year, and to tentatively identify those intersections which require plans preparation for renovation in the subsequent year.

IMPLEMENTATION PLAN

The following is a brief description of a potential traffic control system modernization project. This project has been developed assuming that funding has been secured and therefore, a ten year traffic signal modernization program and a three year central computer modernization program would be implemented concurrently. As a result, this potential TCS modernization project description provides an outline of anticipated program staging elements on a yearly basis.

This program description was also developed assuming the start of the central computer modernization program and the start of the traffic signal modernization program to both occur in Year ONE. If project funding is limited at first, the start of the central computer modernization program could be delayed for two or three years. However, additional delays would impact the time frame for interfacing the new computer system with the new control equipment installed in the field under the traffic signal modernization program.

There are unique benefits to the implementation of each program. Equipment reliability and maintenance would be improved as a result of implementing the traffic signal modernization program. Installing a new computer system would enable additional signals to be centrally controlled. However, the combined benefits of coordination, and improved monitoring and surveillance functions, would be postponed by delaying the start of the central computer modernization program. The existing outdated computer system could not effectively utilize the technological enhancements associated with the new traffic control equipment.

Year ONE (1990)

To complete the ten year traffic signal modernization program, 80 intersections should be scheduled for renovation each year. Approximately 80 intersections located in the downtown area as part of a 128 signal pretimed system operated by 5 subarea masters, have already been identified for upgrade in Year ONE. This equipment is primarily old, experiences frequent problems, and is not under direct supervision of the traffic control system. Therefore, a high priority exists to incorporate these intersections into a new more flexible system.

The City has identified existing bond funds that will be directed towards the traffic signal modernization program for Year ONE. However, it is uncertain if these funds will be sufficient to complete the design and upgrade (furnish and installation costs) of the proposed yearly schedule of intersections. In addition, design plans should be prepared in Year ONE for the scheduled renovation of intersections to be upgraded in Year TWO. Therefore, the existing funds will be utilized to complete the upgrade in Year ONE of as many intersections as possible.

With the completion of this study to formulate a computerized traffic control system concept, the system design process could begin. This would be the first phase of the central computer modernization program and would consist of retaining a traffic control systems consultant to develop a detailed central computer system design based on the recommendations developed by the Blue Ribbon Committee, and then prepare plans and specifications accordingly for construction and installation of the computer system. The system design tasks would include the development of: a central computer configuration; communications interface and surveillance requirements; visual displays (color graphics and wall map displays); central software applications; computer room layout; acceptance testing; training; operator interface; and detailed project scheduling and cost estimates.

The system design should take approximately twelve to eighteen months to complete. Estimated system design project costs for Year ONE have been developed. Program funding for the system design would need to be appropriated in the 1990 budget if the central computer modernization program is to begin in Year ONE, concurrently with the traffic signal modernization program.

Year TWO (1991)

Assuming both programs are initiated in Year ONE, several project activities for both the traffic signal modernization program and the central computer modernization program, can be in operation during this year. Construction could begin on the renovation of the remaining signals of the 128 signal pretimed system initiated in Year ONE, followed by those intersections identified as Category 1 and 2.

Intersection design plans would also be developed for the scheduled renovation of Category 2 and 3 intersections to be upgraded in Year THREE, as part of the traffic signal modernization program. The prioritizing and scheduling of signal upgrades to be completed in this and subsequent years, would be based on the review and annual update of the intersection category listing.

The central computer system design should be completed during this year. Upon approval of the design and the completion of the plans and specifications, construction of the system would begin. The construction and installation aspects of the central computer system would include the purchasing of equipment; initiating work on the development of the central traffic applications software and; field and central site construction in preparation for the installation of the central computer, communications, surveillance, and display equipment.

Additionally, work would begin on the development of timing plans and the system database to be installed on the central computer. The central computer would utilize these timing plans to provide coordination between the signalized intersections. The start of the system construction would also require the start of construction program inspection and management, as well as initiating acceptance testing procedures for the new central system equipment.

Year THREE (1992)

The third year of the central computer modernization program would entirely be committed to the construction of the central system. The renovation of the scheduled Category 2 and 3 intersections would also occur as part of the scheduled Year THREE traffic signal modernization program. Additionally, intersection design plans would be developed for another series of intersections in Category 4 to be renovated in Year FOUR.

The assemblage of the central system components and the computer room configuration should be completed this year. The central computer modernization program would then proceed with the installation of the central system hardware and software, and a continuation of equipment acceptance testing.

Field construction as part of the central computer modernization program, would continue from the previous year with the installation of the necessary communications components to interface the field hardware with the new central system. The field integration would then proceed with initial intersection testing, followed by the transfer of intersections onto the new system from the old system.

The development of the system timing plans and database would continue throughout the year. Personnel training activities would also begin. Project management and inspection would be an ongoing process.

Year FOUR (1993)

The central computer modernization program work efforts for this year would be primarily centered around completion of the central system acceptance testing, finalization of the software development, and central site equipment installation. The work efforts would then be concentrated on the transition of central computer operations from the old system, to the new system.

This transition of computer control would include not only the transfer of signalized intersections currently under control of TDACS to the new system, but also the scheduled pick-up of additional signalized intersections previously operating as isolated or operating as independent coordinated systems without central control or monitoring capabilities. At this stage of implementing the new computerized traffic control system, personnel training would be intensified. The Bureau's staff members would have an active role in the daily operations of the new system.

The signal timing plans generated for the new system would be installed on the new central system. As coordinated groups of signals are brought on-line under control of the new system, the signal timing plans would be field evaluated and fine-tuned.

The renovation of scheduled Category 4 intersections would be completed as part of the traffic signal modernization program for this year. The design work for an Category 5 intersections to be renovated in Year FIVE, would also be accomplished.

Year FIVE (1994)

The fifth year of the TDACS renovation and expansion project would culminate in the completion of the central computer modernization program, and the upgrade of approximately 400 signalized intersections as part of the traffic signal modernization program. The new system would be fully operational and in control of a majority of these signalized intersections by the end of the year.

Central system and field related construction efforts would be completed. The final aspects of the personnel training would be conducted and also scheduled for completion this year. Project management and inspection efforts could begin to be reduced.

Work efforts would continue on the staged implementation of surveillance equipment. System timing plan development, evaluation and fine tuning would also continue.

Intersection design work as part of the continuing traffic signal modernization program would proceed for the remaining Category 5 intersections to be renovated the following year. The renovation of scheduled intersections identified as high priority in Category 5 from the previous year would be completed.

Years SIX - TEN (1995 - 1999)

The remaining years of the TDACS renovation and expansion project would consist of similar work efforts on a yearly basis. Each year a series of intersections would be identified for upgrade based upon a review and update of the intersection category listing. Design plans would be developed for these intersections. Concurrently, the renovation of scheduled intersections identified the previous year, would also be undertaken.

As the remaining signalized intersections in Categories 5, 6, and 7 are renovated, they would be incorporated into the new computerized central traffic control system. Therefore by Year TEN, the majority of the city's estimated 817 signalized intersections would be under control and supervised by the new central traffic control system. By the end of Year TEN, the traffic signal modernization program would be complete.

Years SIX and SEVEN would also include the completion of the remote camera surveillance system. The time tables for this operation could be shifted forward or extended throughout the ten year plan, provided the system design and field construction has included the installation of this system.

Training for the Bureau staff members would also be conducted. This would include updates for additional system components, and the basic system training for new personnel.

IMPLEMENTATION COSTS

The allocation of funds for implementation of these two programs has not been established. The ten year implementation schedule presented in this chapter assumed that annual funding had been secured for both programs. Based on this assumption, preliminary cost estimates have been developed for the implementation of both the central computer modernization program and the traffic signal modernization program, to occur simultaneously and be completed within a ten year period.

Preliminary cost projections for the completion of both programs have been estimated to be approximately 38.5 million dollars. Of this total, approximately 13% or 5 million dollars has been projected for the central computer modernization program, and 87% or 33.5 million dollars projected for the traffic signal modernization program. As shown by these projections, the majority of the total cost estimates would be allocated for the upgrade of the signal related field equipment. The ten year funding schedule is summarized below:

TEN YEAR FUNDING SCHEDULE FOR IMPLEMENTATION PLAN

Year	Central Computer Modernization	Traffic Signal Modernization	Total
1	$ 350,000	$ 1,680,000	$ 2,030,000
2	$ 500,000	$ 3,317,000	$ 3,817,000
3	$2,325,000	$ 4,124,000	$ 6,449,000
4	$1,275,000	$ 4,674,000	$ 5,949,000
5	$ 105,000	$ 3,724,000	$ 3,829,000
6	$ 85,000	$ 3,364,000	$ 3,449,000
7	$ 85,000	$ 3,364,000	$ 3,449,000
8	$ 85,000	$ 3,114,000	$ 3,199,000
9	$ 85,000	$ 3,114,000	$ 3,199,000
10	$ 85,000	$ 3,034,000	$ 3,119,000
TOTAL	$4,980,000	$33,509,000	$38,489,000

Figure 1.1 graphically portrays the proportional relationship of the estimated annual costs with respect to the traffic signal modernization and central system modernization program. These graphs illustrate that the majority of funding for each year will be directed towards the upgrade of field related equipment.

The graphs in Figure 1.1 also illustrate the estimated projected annual funding requirements within each program. As illustrated, funding level requirements for the central computer modernization program would peak in Year THREE followed by a reduction in funding levels in Years FOUR, FIVE, and SIX. Funding would then remain at a constant level from Year SIX through Year TEN. The funding requirements for the last five years of this program would be necessary to complete the development of signal system timing plans to coincide with the addition of signals under central system control.

With regard to the traffic signal modernization program, Figure 1.1 illustrates that funding requirements would peak in Year FOUR, consistent with the completion of the central system installation. Funding for the remaining six years of the program would continue at an approximate uniform rate to complete the signal renovations, but at a reduced funding level from Year FOUR.

To develop cost estimates, work efforts and equipment requirements were formulated into cost categories for each modernization program. Table 1.1 identifies the estimated annual costs and funding requirements for the cost categories within each program.

Cost categories for the central computer modernization program include: system design; software development; timing development; acceptance testing; training; computer hardware; and operator interface equipment. Cost categories developed for the traffic signal modernization program include: intersection design; integration; inspection & management; communications equipment; cable installation; surveillance system; and the reconstruction of the traffic signal infrastructure including controllers, detectors, poles, signal heads, and wiring as necessary.

The cost category funding requirements for each program have been graphically illustrated in Figures 1.2 and 1.3. Figure 1.2 is a proportional allocation of the estimated 5 million dollar cost for the central computer modernization program. Figure 1.3 displays the proportional allocation of the estimated 33.5 million dollar cost for the traffic signal modernization program.

Traffic Signal Modernization (10 Year)

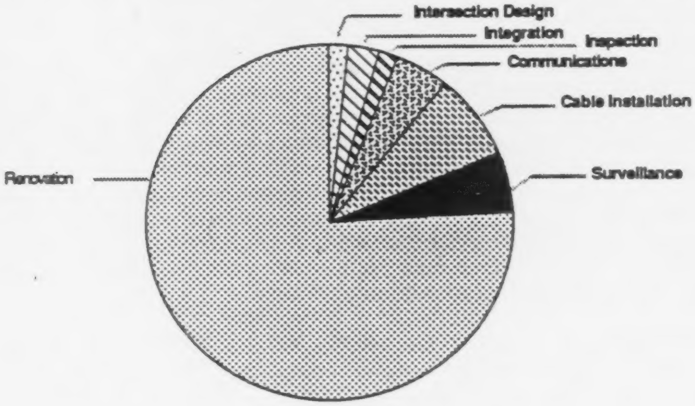

Figure 1.3 - Field Hardware Proportional Cost Allocation

II. ENERGY IMPACTS

For urban area transportation impacts, traffic signal system improvements are considered a very cost-effective energy conservation measure. Traffic signal system improvements range from signal timing optimization to areawide computer control. The Florida Department of Transportation, for example, has implemented several signal system retiming projects. The results of these projects indicate that an annual fuel savings per year of 8,000 gallons per intersection could be expected.

Researchers have noted that one of the main reasons why new computer based systems outperform the previous existing system is that the implementation of computer control is nearly always accompanied by an increase in effort devoted to optimizing signal timing and correcting a variety of minor malfunctions in signal system operation. In a sense, most computer control systems provide the traffic engineer more time to maximize the system's operational capabilities. This factor combined with the benefits of enhanced operation and maintenance generated from advanced traffic surveillance and hardware monitoring features, will almost always result in improved traffic performance, even when compared to fairly high-quality base-condition control systems.

Experience from across the country has indicated that the level of improvement resulting from a traffic signal improvement project is dependent on the prior existing operational conditions. Research has determined that the interconnection of previously uncoordinated pretimed signals with an advanced computer based control system and new optimized timing plans can result in a 25 percent improvement in speed or travel time. A 17.5 percent improvement can result with the installation of an advanced computer based control system and optimized timing plans where previous conditions consisted of interconnected pretimed signals and old timing plans. Advanced computer based control for previously non-interconnected actuated signals can result in a 16 percent improvement. Finally, an eight percent improvement can be realized with advanced computer based control where previous conditions consisted of interconnected pretimed signals with actively managed timing plans. Reduction in travel time can also result in a reduction in vehicle hours and fuel consumption.

In Atlanta as in many other cities, there is considerable awareness of the negative effect that automobile usage has on air quality. Automobiles in urban areas are responsible for the emission of three types of pollutants: Carbon

Monoxide (CO), Hydrocarbons (HC) and Oxides of Nitrogen (NO_x). Automobiles contribute approximately 70% of the total of these pollutants in the atmosphere. Vehicle emissions are a function of various types of vehicle operation such as:

- A reduction in stopped time (idling) reduces CO, HC, and NO_x emissions for a vehicle trip of a given length.
- A reduction in the number of acceleration and deceleration cycles reduces CO and HC emissions for a vehicle trip of a given length.
- An increase in "cruise" or "steady state" speed will reduce CO and HC emissions but may increase NO_x emissions for a vehicle trip of a given length.

The implementation of traffic control system improvements will have a positive effect on the reduction of pollutants. The most significant gains will be at ground level at the intersections.

The installation of new signal systems or the upgrading of older systems has proven to be very cost-effective and beneficial to the public. The central computer system proposed for the City of Atlanta, would be designed to incorporate as a minimum, the 300 signalized intersections currently operating as part of the TDACS, the 376 signalized intersections operating in the numerous small independent closed loop, TM, or sub-area master signal systems, and the 141 currently isolated intersections within the City limits.

There are advantages to central system control for the 141 isolated intersections as well as replacement of the present outdated equipment at these locations. The operational status of independent, isolated intersections can not be monitored from a central location. Therefore, if an equipment malfunction developed, it would only be detected by a routine field maintenance check of the intersection or by a phone call from the public. By incorporating isolated intersections into the traffic control system, it would be possible to monitor these locations for malfunctions. Additionally, the new equipment to be installed at these locations would improve equipment reliability and reduce maintenance calls, thereby improving operating efficiency. In conjunction with these actions, new signal timings would also be developed for these intersections. Research has shown that the retiming of isolated intersections can result in a 50% decrease in delays at these locations which would in turn reduce motorist travel time.

This chapter will illustrate the benefits of implementing a new central traffic control system. It will demonstrate the impact of expanding the City of Atlanta's computerized system to incorporate all of the estimated 817 signalized intersections under the control of traffic computers at City Hall. The major objective to be accomplished is to improve traffic flow efficiency by reducing stops and delays, improving fuel consumption, and reducing pollutant emissions.

The information in this chapter was derived mathematically by combining the results of two previous before and after studies conducted in Atlanta which consisted of an impact assessment of placing under central computer control intersections that were operating in various types of independent systems.

For the analysis of this proposed project, it was assumed that intersections would receive new microprocessor based controllers, be brought on line into a single central monitoring and control system, and also retimed to provide improved traffic flow throughout the system. Further, it was assumed that system sensors for traffic responsive operation would be embedded in the roadway pavement at strategic locations throughout the City.

METHODOLOGY

This impact analysis uses as a baseline, the before-and-after results obtained from the Parsonson & Associates studies. Coincidental with the City's decision to incorporate the independent signal systems along Piedmont Road and Martin Luther King, Jr. Drive into the existing central traffic control system, Parsonson & Associates conducted before-and-after speed-and-delay field studies to assess the impact. The results demonstrated that travel time and speed improved significantly in both directions of travel and that vehicle operating costs and time costs to motorists, as well as fuel consumption and pollutant emission were reduced significantly. Results were recorded in four areas:

1. Motorist Time Cost
2. Fuel Consumption
3. Cost versus Payback
4. Pollutant Emission

The study results of two separate projects were chosen for the baseline analysis, to attain a more accurate representation of existing system operational characteristics. The City of Atlanta has a multitude of independent systems with different characteristics such as the age of existing equipment, number of intersections in a system, volume of traffic in the system, types of side streets intersecting the main street of the system, and land use characteristics within each system. The varying characteristics within each of these two systems impacted the study results, demonstrating that these factors are important in the assessment of impacts. The Piedmont Road system integration resulted in benefits exceeding those attained from the M.L.K. Drive central system expansion. It was assumed that the results were typical for these respective systems. Therefore, the results of these two projects were chosen for the baseline analysis, with their individual results combined and expanded to give a representation of the expected results for the remaining independent systems throughout the City.

The baseline studies employed the RUNCOST computer program to produce estimates of the time cost of operating the average vehicle under conditions observed before and after each independent system was integrated into central system control. The results of these two studies are provided in Tables 2.1 and 2.2.

The results of the M.L.K. Drive and Piedmont Road studies were combined and reduced to a per intersection basis. These values were then adjusted using the Consumer Price Index to account for the rate of inflation occurring between the time that the baseline studies were conducted in 1986 and today. These results are provided in Table 2.3.

Of the 676 coordinated intersections in the City of Atlanta, 376 operate in independent systems, similar in characteristics to the baseline studies. Therefore, they would be expected to receive a similar magnitude of benefits. The 300 coordinated intersections currently on the central system would also receive benefits from the implementation of a new computer based system, but of a slightly lesser magnitude. Research has shown that these signalized intersections can receive approximately two-thirds the benefits attained when intersections operating in independent systems are integrated into a more advanced central computer system.

The projected levels of improvement developed for each of these intersection groupings were then combined using a weighted average according to the respective number of intersections within each group, to estimate the overall benefits that would result from the implementation of the new computerized traffic control system. The results are provided in Table 2.4, and are discussed in the following subsections. The 141 isolated intersections would not receive the same quantifiable benefits as either of the two groupings, and thus were excluded from these calculations.

CHANGE	BEFORE	AFTER	%
Stops and Delays (hours/week)	7,735	7,296	- 5.7
Fuel Consumption (gals/week)	12,954	12,544	- 3.2
Pollutant Emmission (lbs/week)	27,483	26,327	- 4.2

Table 2.1 Results of the M.L.K. Study

CHANGE	BEFORE	AFTER	%
Stops and Delays (hours/week)	25,555	19,483	- 23.7
Fuel Consumption (gals/week)	36,907	29,469	- 20.2
Pollutant Emmission (lbs/week)	92,940	65,502	- 29.5

Fuel Consumption (gals/week)	1,473,004	1,275,336	- 13.4
Pollutant Emmission (lbs/week)	3,557,112	2,837,588	- 20.2

Table 2.4 Summary of Findings for Expansion of the City's Traffic Control System
(value are based on 676 intersections and indexed to inflation)

STOPS AND DELAY

Stops and delays in the baseline studies were derived by assessing many different forms of data. These study results which were combined, averaged, and indexed to inflation, can be applied to the 376 signalized intersections operating in independent systems. As shown in Table 2.3, before the signal system improvement is made, the accumulated stops and delays per intersection is 1,454 hours/week. After the signalized intersections are brought under central computer control, it is estimated that the stops and delays will be reduced to 1,170 hours/week. Overall this is a reduction in stops and delays of 19.6%. Expanding this information to encompass the 376 independently coordinated intersections and the reduced benefits anticipated from the 300 signalized intersections currently under central computer control, indicates that before the signal system improvement, total stops and delays for 676 coordinated intersections are approximately 982,904 hours/week which will be reduced to 819,420 hours/week after the implementation of the new system as shown in Figure 2.1. This translates into a projected reduction of 16.6%, or a savings of 163,484 hours/week in stops and delays at coordinated intersections.

FUEL CONSUMPTION AND POLLUTANT EMISSION

In a similar fashion, excessive fuel consumption and pollutant emission due to stops and delays was determined before and after the proposed improvement. Excessive fuel consumption is determined to be 0.007 gal/stop and 0.00022 gal/second for delay. The results of the baseline analyses applied to the 376 signalized intersections indicates that fuel consumption per intersection prior to the signal system improvement is 2,179 gallons per week, and 1,836 gallons per week after the improvement: a reduction of 15.7% as shown in Table 2.3. Applied to 676 coordinated intersections, total fuel consumption is 1,473,004 gallons per week before the signal system improvement, and an estimated 1,275,336 gallons per week after the improvement: a reduction of 13.4% or 197,668 gallons per week as shown in Figure 2.2. At an average cost of $1.00/gal of fuel, this is a motorists cost savings of $197,668 per week.

The pollutant emission is determined at 4.33 gm/stop, and 0.281 gm/second for delay. The results of the analysis shown in Table 2.3, indicate that the pollutant emission per intersection is 5,262 lbs/week before the signal system improvement, and 4,013 lbs/wk after the improvement. Applied to 676 coordinated intersections this results in pollutant emissions of 3,557,112 lbs/wk before the improvement and 2,837,588 lbs/wk after the improvement as shown in Figure 2.3. This translates into a 20.2 percent reduction.

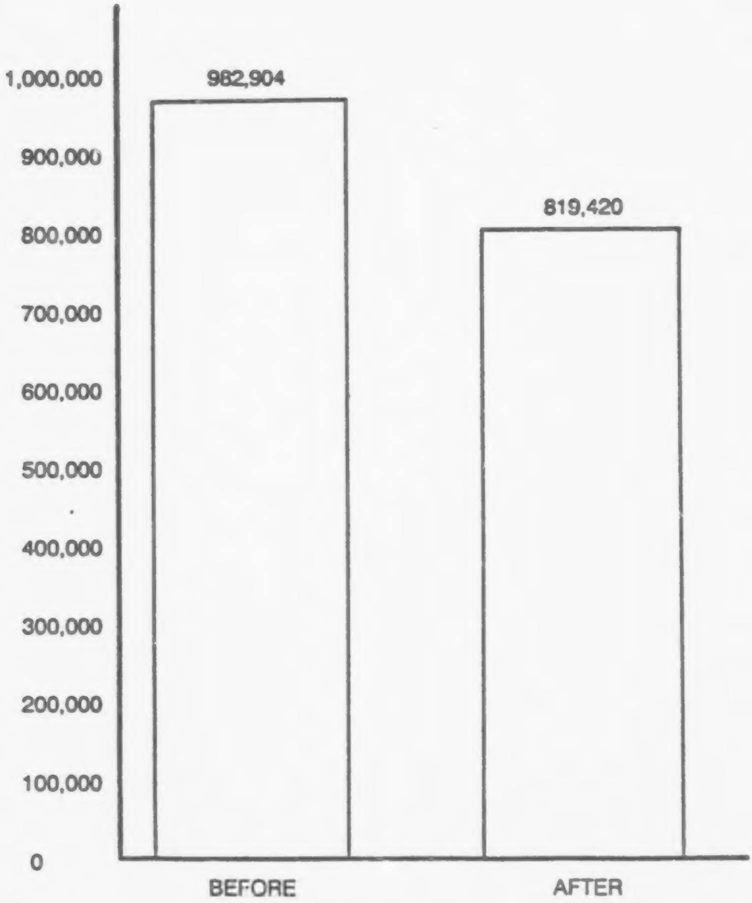

Figure 2.1 - Projected Improvements for Stops and delays at Coordinated Intersections (hours/week)

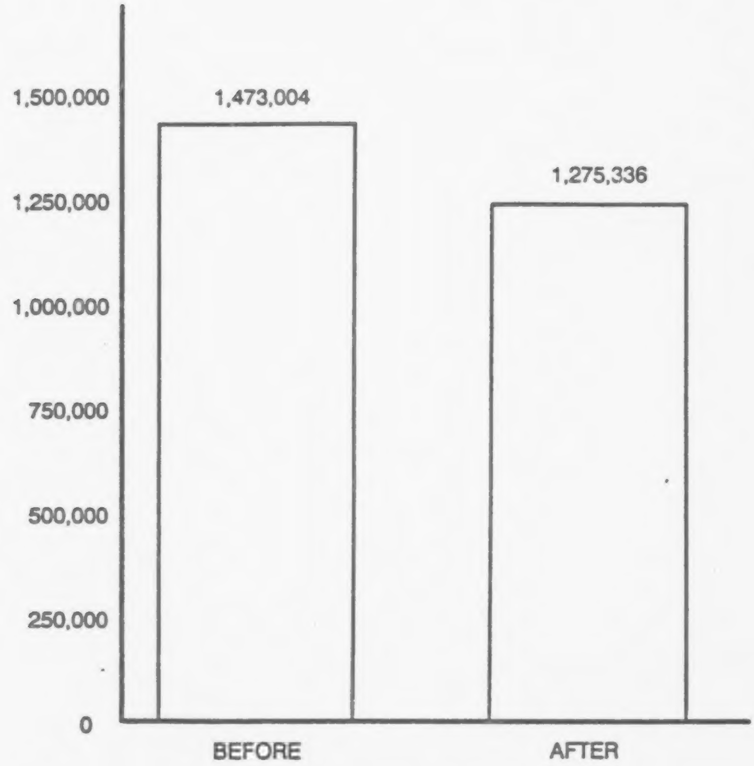

Figure 2.2 - Projected Improvements for Fuel Consumption at Coordinated Intersections (gals/week)

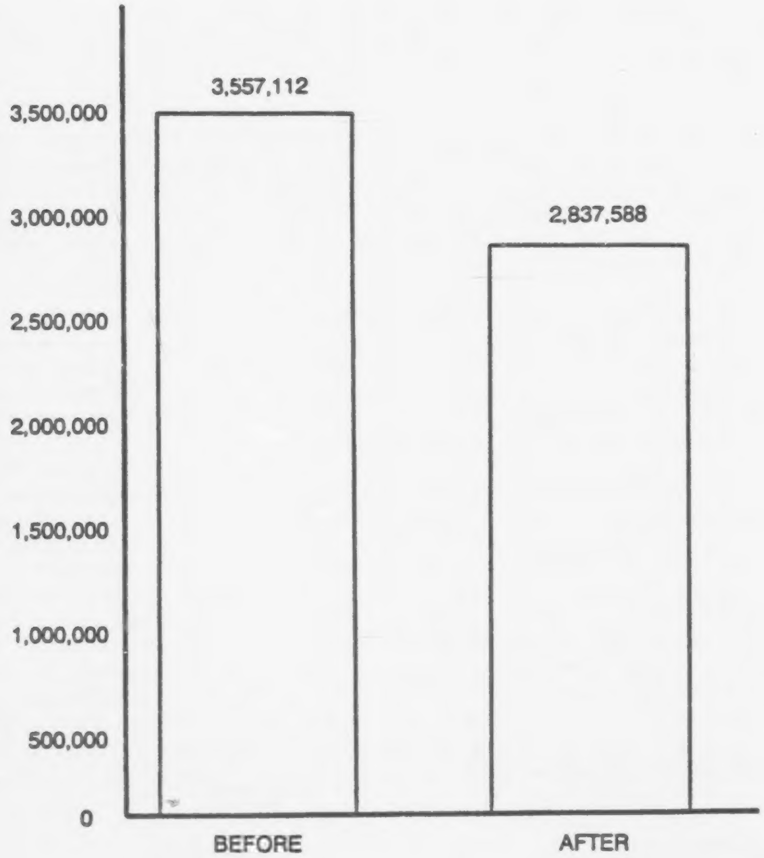

Figure 2.3 - Projected Improvements for Pollutant Emission at Coordinated Intersections

COST VS PAYBACK OF THE SYSTEM

The cost of the new system has been estimated at $38,489,000. This is the total cost of the central computer modernization and traffic signal modernization programs as shown in Table 1.1.

The payback of the system can be determined by using the vehicle cost savings. The estimated vehicle cost savings per year in the Piedmont Road and M.L.K. Drive studies was $1,467,000 and $115,000 respectively. These values were combined and divided by the number of intersections, to estimate a savings in vehicle operating costs per intersection per year of $60,846. This number was used for the 376 intersections currently coordinated but not in the central computer system.

However as stated earlier, the improvement benefits attained from coordinated signals currently under control of the central computer system would be two-thirds the benefits attained when intersections operating in independent systems are integrated into a new central system. Therefore, the vehicle cost savings per intersection per year for intersections currently under central computer control would be approximately $40,564.

The implementation plan outlined in Chapter 1 suggests that approximately 80 intersections are to be renovated and brought under central computer control. Using this implementation plan as a guide, the benefits per year were calculated and compared to the cost projections as shown in Table 1.1. The results of this analysis are shown graphically in Figure 2.4. This figure illustrates that the benefits to be accrued by the implementation of both programs are increasing at a exponential rate, surpassing in Year 2 the cost of these programs, which remain linear. The overall benefits of the system are projected to be $175,236,480 in vehicle cost saving over the ten year period that this project would span. This is a payback ratio regarding system cost of 4.6 to 1. This would also result in a savings of $136,747,480 to the motorists of the City of Atlanta over the next ten years.

CONCLUSION

The results clearly indicate that it would be beneficial to implement a new computerized traffic control system and upgrade the field hardware. One of the benefits that the motorist will receive is the decrease in travel time throughout the City of Atlanta. Additional systemwide benefits would include the reduction in

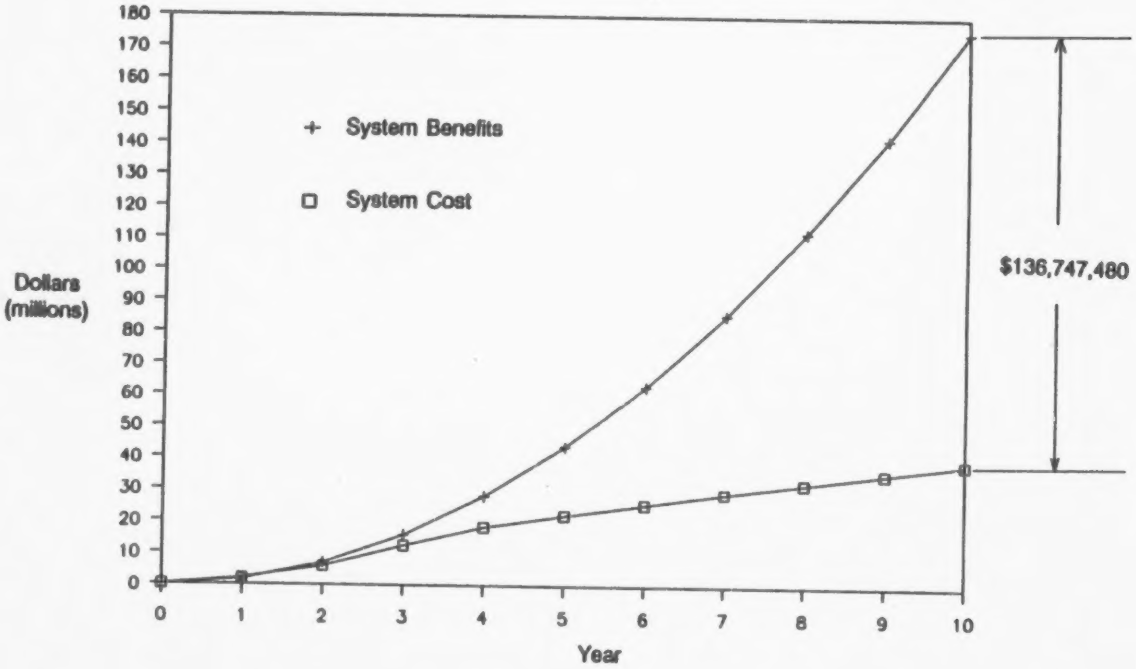

Figure 2.4 - System Cost vs. System Payback

emission pollution and fuel consumption. It is critical to note here that the federal government has determined that the City of Atlanta is classified as a non-attainment area with regard to environmental standards for emission pollution. Taken together these results make a strong case for the implementation of both programs.

TESTIMONY
FOR
CONGRESSIONAL HEARING
U.S. HOUSE OF REPRESENTATIVES
PUBLIC WORKS AND TRANSPORTATION COMMITTEE

August 8, 1990

SUBMITTED BY: Ms. Odessa Pope Wheeler
2436 Abner Place, N.W.
Atlanta (Fulton County),
Georgia 30318

Atlanta City Hall
55 Trinity Ave., S.W.
Atlanta, GA 30335

SUBJECT: INFRASTRUCTURE as it relates to the Northwest communities of northwest Perry-Browntown, Scott Crossing, Riverside-Whittier, Bankhead Highway-Bolton Road surroundings.

Residing in the northwest community for the past 29 years, Proctor Creek, has been, and is the number one most pressing problem confronting these communities. Each year before and after the developement of community block grants for capital improvements, these communities have begged the city of Atlanta for treatment of the horrible ordor, and the overflowing of the creek (Proctor), along the Hollywood Road bridge and residential backyard washout Clarissa Drive, N.W. located in the 221 housing. Somedays you must completely close all windows if you are allergic, or to eat.

After the loss of lives, two from one family, (over three children), one was never recovered, the community still received no help. Proctor Creek and its territories, cross state and county lines. We know Maddox Park on Bankhead Highway is the beginning somewhere near or on the boundary of Southern Railroad branching off at different places until it reaches the Chattahoochee River which enters the Mississippi and terminates at the Gulf of Mexico.

Food plains, storm and sanitary sewars, streets, highways and bridges has not changed the characterization as it relates to a poor community after admission into the city limits in 1952.

Not only does the community suffer from a polluted creek, but more landfills per community in the City of Atlanta.

Respectfully submitted,

Ms. Odessa Pope Wheeler
August 6, 1990

PRESS RELEASE

I, Odessa Pope Wheeler do hereby publicly announce my candidacy for the 9th District Council Seat. I will do my best, to continue the same mode of work. I am going to better the quality of life in the N. W. Community, which has ong been the dumping ground for those things nobody wants health wise and other. I have long been asking that Grove Park Place be closed off because it has been used as a dumping ground, but have gotten little support from the city. There is a sense of hopelessness in the community, and if I am elected I will make a change in the area that the city can be proud of.

I can be an eight hour council person, my goals are those of economic development. Better pay, training and higher visibility of our Police Department. Crime against our senior citizens must be addressed, substandard housing must be eliminated for all our citizens. More occupational outlook for our young people who have strayed because of hopelessness, more and better ecreational outlets to keep in there own areas. Proctor Creek and it territories will be given priority if I am elected. I will support the state department of highways to create a Bankhead Highway corridor also Bolton Road, and James Jackson Parkway. The 13 acres of city property ocated in the Riverside Community, I shall request he city to help finance or build housing requested by the residents of that community.

I will not let you down, so help me God. Send me o City Council for one term I will make a DIFFERANCE.

I, Odessa Pope Wheeler, live in the northwest community for 28 years. My occupation is Community Activism and retired insurance combination agent for the North Carolina Mutual Life Insurance Company.

I am Odessa Pope Wheeler, the daughter of the late Tannis Lee and Mary Bell Pope, widow of Virgil Wheeler. My community involvement did not begin recently. During the life time of my father, who was one of the initial organizers of the bonus March to Washington, D.C. in the year 1932 to receive their bonus due from service in World War I. In 1933 he was appointed by M.A. Lienson from the State Capitol who was the director of Veteran Affairs for the State of Georgia, as a warrant officer to consult over veteran affairs for Widows and Orphans in the state of Georgia.

As a child volunteer I assisted him in his offices at 311 and 380 Auburn Ave., N.E., Atlanta, Georgia. After moving from the 4th ward community where I had lived all my life, I moved to the Northwest Perry-Browntown Community where I met Mr. Otelus Shelmon known "affectionately as the Mayor of Scott Crossing. I and other community people" assisted him in his day to day operation of the community which was run liken unto a city government, each volunteer had specific jobs to perform pertaining to the community. My job was that of field worker and sub-professional social worker.

After Mr. Shelmon's death I chartered the Otelus Shelmon Foundation with two other persons. I have continued to devote my time as a community volunteer. I am frequently contacted by members of my community, government and private organizations to assist them with problems or make referrals. WAOK Council of Women, Economic Opportunity Atlanta, Federation of Southern Cooperatives. Historical Preservation and the Minority Community Southeast Region National Historical site and Preservation for the Martin Luther King Historical district. Community representive for the proposed and now Atlanta Industrial Park. Initial organizer along with other community residents to form Northwest Grady Satellite Clinic. Community task force Representative for the proposed additional runway for Fulton County Airport (Brown Field).

Patron radio station WRFG, participant victim Witness Assistance Program and Partnership Against Crime Lasion person for the community. The Young Adult Guidance Center, Inc. is one of three incorporates to house homeless young males ages 16-21 non-sectarian and non-racial that I am affiliated with in the community. I was sent to Washington D.C. to represent Atlanta in the Solidarity March in 1981. I have worked with students from Georgia State, Georgia Tech and Emory University in the area of Antropology, Community Developement, and medical student for better delivery of Health Care. I was instrumental in training the first Vista Volunteers in the Atlanta area for Volunteer Service to America. Help to develope young people reprsentation in community Northwest Perry Poverty Program, and continue to enhance and inspire young people to participate in leadership roles in our community. As a volunteer I developed several organizations which was funded by the government while involved with the Poverty Program. Appointed by the Mayor to the Solid Waste and Recyling Advisory Committee and the Urban Homestead Application Review Board.

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

WEDNESDAY, AUGUST 8, 1990

House of Representatives,
Committee on Public Works and Transportation,
Conyers, GA.

The committee met, pursuant to call, at 2:10 p.m., in the Superior Courtroom, room 214, Rockdale County Courthouse, Conyers, Georgia, Hon. Glenn Anderson (chairman of the committee) presiding.

Present: Representatives Anderson and Jones.

The **Chairman**. The meeting will come to order.

Good afternoon. The Committee on Public Works and Transportation hearing on the future of our Nation's infrastructure needs will come to order. It is my pleasure to welcome you here today and to thank you for taking time from your busy schedules to share with us your concerns, knowledge and perspectives on this important subject.

For several months now, our committee has been examining many aspects of the infrastructure issue, seeking a better understanding about our Nation's public works crisis. We have explored emerging infrastructure needs from the national perspective and reviewed the impact of infrastructure on private sector investment and on productivity, growth and the ability of the United States to compete in international markets. We plan also to look at infrastructure financing alternatives and new technologies.

It is important, however, that we understand what kinds of infrastructure problems are being experienced at the state and local levels. So, we have embarked on a series of hearings at various sites around the Nation to talk about the inadequacies of existing public facilities with people most directly involved, and to get a broad range of ideas and suggestions that can help to resolve some of the problems. Earlier this month, we met in St. Clairsville and Youngstown, Ohio. Monday of this week, we were in Lafayette, Louisiana, yesterday in Victoria and Fort Worth, Texas, this morning in Atlanta, and hearings are planned for other areas of the country as well.

I must compliment the citizens of this area for sending Ben Jones to the Congress. We are grateful that he chose the Committee on Public Works and Transportation. When Ben came to our committee, he quickly developed a reputation for his preparedness and being well informed on the issues, and for his independence of mind. He has, in my view, become a most effective member of our committee. He quickly made known to us the importance of the water issues to his district; the vital necessity of water supply for this region as well as the need for wastewater treatment facilities. He has also brought home to us that Atlanta is one of the most important transportation hubs of the Nation. With its three interstate highways and its international airport, which is one of the largest passenger terminals in the world, Ben certainly chose the right Committee.

When we speak about infrastructure, we are speaking about the very cornerstone of our cities and rural communities. Inadequate infrastructure weakens our economic foundations, threatens the health and safety of us all and jeopardizes our future standard of living and the quality of life we have come to enjoy.

When addressing the importance of infrastructure, we should note that recent economic research shows a link between the level of public investment in the Nation's infrastructure and productivity and profitability in the private sector. The United States productivity growth rate fell from 1.8 percent annually in the 1960's to less than 1 percent, or 0.7 percent, in the early 1980's, while during the same period the annual growth rate of spending for infrastructure fell from 4.5 percent to 0.8 percent. Productivity in our country is growing much more slowly than in other developed Nations such as Japan, West Germany, Canada, France, Italy and the United Kingdom—our economic competitors—some of which invest almost five times as much on their public works as does the United States. We, in fact, rank 55th in the world in infrastructure investment, and that is pretty shocking.

All evidence reflects that our 20 plus years of under-investment in public works spending at all levels of government have caught up with us and we are seeing a wide-ranging and serious problem.

It is time to do something about it. Last week I introduced a concurrent resolution, which was co-sponsored by Mr. Jones and many of my colleagues, expressing the sense of Congress that 1991 should be the rebuild America year. It calls for the President and the Congress to work toward establishing a comprehensive national policy to rebuild the infrastructure of the United States. We must recognize that the condition of our infrastructure is one of the Nation's most important issues and it must be given a much higher priority. The longer we wait, the more harm we do to our economy and the more costly our catch-up of the job will be.

Meantime, we are continuing our inquiry and look to you to help us gain further insight into infrastructure needs. Our question today is: What is the condition of the infrastructure in Georgia, particularly this region of the state? Is your network of public facilities—your roads, your bridges, public buildings, airports, sewers, wastewater treatment plants, water treatment and supply facilities and other basic services—adequate to meet the current and anticipated needs of the area?

Who do you think should pay for the necessary public works and what financing techniques have you considered? What do you think the federal role should be? The state role? The local role? And what should our committee be doing to resolve some of these problems?

We look forward to your answers and to any questions that you may raise.

Now I think we might start off with Congressman Jones for any opening remarks he might have.

Mr. JONES. Thank you, Mr. Chairman. I do have an opening statement.

First of all, I want to thank you on behalf of the people of the fourth district, for holding this field hearing here in Conyers to gather information about our infrastructure needs. I commend the work that you have done as Chairman of the Public Works Committee to establish the link between infrastructure and economic productivity, and the necessity of reinvesting in our Nation's infrastructure after a decade of neglect.

We here have a first-hand appreciation of the link between infrastructure and productivity and the necessity for a strong investment in our public works.

During the last decade, the fourth district, and the Atlanta region have experienced rapid growth. Between 1980 and 1989, the 8-county Atlanta region added 549,000 people and 461,000 jobs. One of the highest rates of growth was here in Rockdale County, whose population increased 49 percent over the last nine years. The north Fulton area also had explosive growth over the last decade and is adding an average 8,114 new residents a year. And since 1985, De Kalb County has added 10,600 new residents. These high rates of growth are projected to accelerate over the next few years, and we can expect a near doubling of population by the year 2010.

To assure our continued economic development, we must effectively address our basic needs for infrastructure so that it serves our anticipated demands for highway and transit travel, waste supply, waste disposal and wastewater treatment while simultaneously protecting our environment and natural resources.

Alabama's recent suit against the United States Army Corps of Engineers over planned water withdrawals from the Chattahoochee River for our region, and the water restrictions caused by the summer drought, have made it clear that our number one priority is an adequate water supply for our projected growth. Without water, and the facilities to treat it, our growth will simply stop. This would have a most severe economic impact for our District, the region and the southeast. Both Rockdale and Newton Counties are planning to meet anticipated water demands with the construction of county water reservoirs financed by a local sales tax. Later today, we plan a tour of the Newton County water reservoir so that you can see first-hand, Mr. Chairman, the outstanding job that county has done. During the hearing today, we will learn more about our projected demands for water and sewage facilities, and how we can help meet those needs.

Adequate water resources for the Fourth District has been a special concern of mine and I am very pleased that our Subcommittee on Water Resources will hold a field hearing on September 28 to learn more about our vital water supply issues. And that hearing will be held in the Manuel Maloof Center in De Kalb County.

Mr. Chairman, I am also concerned with developing alternative modes to highway travel for our region. Our rapid growth has led to ever-increasing demands on our transportation system and traffic congestion has become more of a regular occurrence on our over-burdened highways. I am one who believes that we must look to rail transit as a supplement to our highway system, so we have invited a special rail panel today so we can learn more about the possibilities of commuter and inter-city rail for our transit needs and I look forward to their testimony.

Mr. Chairman, I wanted to hold these hearings in Conyers today because Rockdale County has shown leadership in dealing with the problems of the future. We have an opportunity in Rockdale to plan for the future, to set forth a vision which will protect and enhance the quality of life and environment by planning and investing now in our roads, bridges, water supply facilities, wastewater treatment plants and other public works facilities. My hope is that this hearing will help serve as a blueprint for that future and begin a state, local and federal partnership that will build the kind of community we want to pass on to our children and our children's children.

As many of you know, I am opposed to the Presidential Parkway as designed, and this is an area where I disagree with state transportation officials. The design of the Presidential Parkway is destructive to the intown neighborhoods, and I think would be better served by alternatives. The only road design I would support is a very limited access to the Jimmy Carter Presidential Library.

In closing, Mr. Chairman, I want to thank the people of Rockdale County for graciously agreeing to host this hearing and I want to thank everyone here for attending and to thank our witnesses for the time that they have given us today.

The CHAIRMAN. I want to thank you.

Unfortunately, we are on a tight schedule and we must wind up this session as close to 4 p.m., as possible.

Because there are so many of you who have been willing to participate in this hearing and because of the time constraints, I am going to ask that you summarize your statements in hopefully no more than 2 or 3 minutes. That should leave us some time for questions. I want to assure you that your written statements will be printed in their entirety in the record of this hearing.

Also I note that witnesses are on panels, and I would suggest that with each panel we hold our questions until each panelist has made an oral statement. Because of the number of witnesses testifying, it may be difficult to ask questions of each individual. Some questions may be general and I will leave it up to the panel members to decide who will respond. Please be as brief as possible.

Now I am going to call our first panel of witnesses. They are: Mr. Harry West, Executive Director of the Atlanta Regional Commission, and the Honorable Hal Rives, Commissioner, Georgia Department of Transportation, both of whom were also with us this morning.

Mr. West, will you open it up then and then Mr. Rives. Then we will ask you questions.

TESTIMONY OF HARRY WEST, EXECUTIVE DIRECTOR, ATLANTA REGIONAL COMMISSION AND HAL RIVES, COMMISSIONER, GEORGIA DEPARTMENT OF TRANSPORTATION

Mr. WEST. Mr. Chairman, thank you. I am Harry West. I appreciate the opportunity to be with you today and to share some information with you. And it is always nice to be with Mr. Jones, who is my own personal Congressman.

As he indicated earlier, the Atlanta region has been growing at a rather rapid pace over the last few years and it is projected to continue that growth into the next decade as well as the next century, reaching some 3.7 million people in the year 2010.

More people will drink more water, drive more cars, will throw away more garbage. Simply speaking, we have got our work cut out for us as we move to try to meet these infrastructure demands.

VOICE. Mr. Chairman, we are having difficulty hearing the witness. Could he speak up loudly?

Mr. WEST. Those projections for the future will be met provided we can solve what we consider to be our number one infrastructure problem today, and that is water supply. As Mr. Jones indicated, it is a concern with the region, and if we do not answer those questions fairly soon, we can reduce the expected growth that we have projected in the region by about 80 percent after 1995.

In other words, without an adequate water supply, the Atlanta region may lose more than 800,000 people, 500,000 jobs that are forecast to come here between 1995 and 2010, under normal conditions.

Yes, water is the most critical issue facing the region, and yes, we need your help, in any way you can—reallocation of a portion of the storage at Lake Lanier has been the suggested way of meeting our initial needs to the year 2010, which will then—our needs beyond that point will be met by the construction of a number of regional reservoirs, such as you are going to be able to see this afternoon. But to get us to 2010, we have got to have a better way to manage the water that is present and usable in the Lake Lanier-Chattahoochee River system. We are not asking to divert the water as some in Alabama have suggested, we only ask to be able to use it, clean it up and put it back into the river so that other people downstream can use it.

But we also have other problems, and one of those is wastewater cleanup that I just mentioned. We have got to be in a position to clean up the water after we use it. With the assistance of the Corps of Engineers in a project that was authorized by the Congress in the early 1970's, we did what was known as the Metropolitan Atlanta Water Resources Study, and a party of that study included a comprehensive wastewater treatment plan for the region. It is now out of date, it needs to be updated. We are attempting to do that but it is very expensive to do, and we ask for your assistance, as has been pointed out by the Committee's work on the Water Resources bill that would ask the Corps of Engineers to look at the studies and what would be necessary to bring it up to date within a year. And once that is accomplished, we hope that you would move further and bring that study—help us bring that study up to date.

We are doing some things on our own; banning phosphate detergents, meeting higher treatment standards and other things, but it is going to take all of us working together.

I do not want to spend all of my time on water and wastewater though, even though Mr. Rives is sitting here, transportation is certainly a major infrastructure need of the region. Thanks to the Georgia Department of Transportation, we are well ahead of the game. With the reconstruction of our freeway system, both the radial system and the perimeter, we have been able to get ahead and without their leadership and their commitment to that process, it could never have been done. But we are going to have more needs in the future. We are going to need to continue to expand our rapid transit system as well as our highways and probably the most important transportation issue that we will have in front of us in the next few years is the construction of another air carrier airport that will supplement what we have now at Hartsfield International.

There are many other infrastructure questions that we could talk about, such as adequate housing supply and other things, solid waste disposal, but I will not keep going on and on. I will tell you once again that water is our biggest concern at the moment.

Thank you, sir.

The CHAIRMAN. Water and another airport, huh?

Mr. WEST. Yes, sir.

The CHAIRMAN. Commissioner Hal Rives of the Georgia Department of Transportation.

[The prepared statement of Mr. West appears on p. 1321.]

Mr. RIVES. Thank you, Mr. Chairman, for hearing me again, and you too, Mr. Jones. I am pleased to say that I live and vote in your District.

In the last two decades, Georgia has generally out-performed the Nation in rates of population, economic and personal income growth. We are attracting more foreign investment and we have an excellent chance to host the 1996 Olympics.

But we need things and we do not come empty-handed. We need greater mobility, we need to aggressively attack recurring urban congestion and we have done that to a certain extent already in Atlanta, but we cannot let it rest there, or else it will go away.

We need to bring our rural areas out of decades of economic isolation from poor transportation facilities, and we need to replace what we call modal rigidity with flexibility and greater consumer choice. I speak highly about MARTA every place I go to speak in the Atlanta metro area, I speak to the fact that MARTA is, as we go more and more into the next century, MARTA is going to become the predominant and the most important I think factor in transportation in the Atlanta metropolitan area. We need to work harder to reduce accidents and fatalities, and we are. This past year, we have achieved the lowest fatality rate overall that we have ever had, 2.03 per 100 million vehicle miles, and that is on every class of system all lumped into one. And we need to make research and technological innovation a real part of our transportation program.

We believe in maintenance. In many ways, I have a hard time with respect to the state highway system talking about our crumbling infrastructure, because ours is not crumbling. It is not crumbling because our Transportation Board many years ago, back in 1975, instructed us to maintain first and build new facilities second. And we have done that. Consequently we are short—our big shortage, not in terms of fixing up what we have on our state highway system, but adding more lane power to that state highway system because we have not done that over the years. In years of short funds, we have maintained what we had and let the additional capacity wait. We deferred capacity rather than deferring maintenance, and I think we were right to do it.

Even that has become more and more of a problem because in the past four years we have had a very aggressive program of four-laning throughout the state. We are doubling our lane miles without changing our center line miles and because of costs going up and revenue not going up, we have not been able to keep our maintenance program up to the standards that we would have liked to have kept it up to. Something has to happen with respect to that.

Now Rockdale County where we are meeting this afternoon, we think presents a very good example of a county that is on the verge or on the edge—it is right now split between rural and urban because it is right on the edge of the big expansion from the Atlanta metropolitan area. Rockdale County has needs, and we are working with Rockdale County to address those needs. We, working with them, made a special transportation study of the Rockdale County area and we have done this with others—I am using them as an example since we are here today.

We made a transportation study of the Rockdale County area and Conyers area, and from that, working with the local governments, the mayors and the county commissioners, we have programmed a series of projects that we hope will solve some of the problems, the problems that we can solve, over the next 4 or 5 years. That takes money and we are looking forward the the new reauthorization act to help provide some of those monies. Money is the fuel that makes the transportation engine run by providing for transportation and providing for the maintenance of what we have.

I will not go into details on what we have or what we are planning on doing, it is in the report. But let me say this—let me speak now to the new reauthorization bill that will have to come up. There are several things we would like to see in the reauthorization bill.

One thing you mentioned this morning, Mr. Chairman, about the impoundment of funds through the obligation authority process to offset the deficit. Georgia has $250 million in that category of impounded funds and we would sure like to have the obligation authority to start spending that $250 million. We have projects ready to go if we could spend it. If we get into a little bit of a recession and you want to prime the pump, that is an awfully good way to do it. You give us that $250 million and we will have it spent and working within 6 months, I guarantee you.

We believe the new reauthorization legislation should correct what we see as some inequities in the 85 percent minimum allocation program. We think that was fine for the big western states that have lots of mileage on the interstates and very little people and not a lot of money, while they were building the interstate system. We think it is fine to continue to help them to maintain and keep up and operate that interstate system, a system of national significance, but we do not think that we should continue to subsidize their local road programs. And so we suggest that a floor of 90 or 92.5 percent, something like that, would be more equitable now that the interstate system is essentially complete.

We also hope that in the reauthorization we can—that you can reach up to the AASHTO recommendations with respect to the levels of funds, which is $17.6 billion in fiscal year 1992 to $25.9 billion in fiscal year 1995. We would also like to see you raise the transit capital funding from $3.2 to $5 billion in the same period.

We also need money to acquire rail. For example, there is 30 miles of abandoned rail lines, it starts in Atlanta and leads to the northwest out to the area that is so heavily developed. CSX has abandoned it and they are holding it for us to buy next year if we can find the money, for $7.1 million. One day—it is an investment in the future—that will be commuter rail line coming into the Atlanta area from the northwest. And there are others like that around the state and we need some help in being able to purchase those as a future investment.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you. I have two questions. My first is how do you see the financial burden being shared by the Federal, State and local governments? I know you answered that a little bit, but is there any more—any simpler formula or anything that you could devise?

Mr. RIVES. I think it should be shared fairly equally.

The CHAIRMAN. Between the three?

Mr. RIVES. No.

The CHAIRMAN. I said Federal, State and local.

Mr. RIVES. No, I cannot speak for the locals. Except for some of the major urban areas, the local governments generally in Georgia have not had too much money to put into transportation. If they had to share one-third/one-third/one-third, there would be many local governments that would be even more transportation destitute than they are today.

We have a fairly heavy program of aid to local governments, about $100 million a year. I do not want to see the Federal share diminished. Now I do not mind keeping the Federal program share level and perhaps changing some matching ratios around, but I do not want to see the Federal share diminished. I think that the Federal program needs to expand just like the state program, and most state programs have raised their taxes going into the state program over the past several years and the Federal Government has diminished theirs.

The CHAIRMAN. Well are you satisfied with the Federal formulas in existing public works legislation such as highways, airports, mass transit, et cetera? Maybe that would include both of you.

Mr. RIVES. Let me answer first—I am except I think it is time to declare the interstate to be completed and then—with some money left over to finish up projects, and then that could cause a redistribution of the money through different formulas.

The CHAIRMAN. Harry.

Mr. WEST. I do not have anything to add to that.

The CHAIRMAN. Nothing to add to it at all—to either question. OK. Then, Congressman Jones.

Mr. JONES. Thank you, Mr. Chairman, I wanted to reiterate we had hearings this morning in the fifth district and we touched on some of these subjects but I would like to revisit that slightly, and you touched on it also, which is the use of the highway trust fund, the airport trust fund. These are enormous funds, I think there is something like $19 billion in the highway trust fund.

Mr. RIVES. And $8 billion in the airport trust fund.

Mr. JONES. $7 to $8 billion in the airport trust fund. These funds are being used basically to offset the real extent of the national deficits that we have.

Mr. RIVES. Yes, sir.

Mr. JONES. And that is a sham and it was not the intention of these funds and that should be changed. As you know, I have cosigned some legislation which would take the highway trust fund off budget.

But for the record, I wonder if you would, Mr. Commissioner, tell us what share of what we pay in do we get back.

Mr. RIVES. Right now, Georgia is getting back 71 percent of what we pay in, we get back 71 cents on the dollar.

Mr. JONES. Thank you. I think that speaks for itself.

We talked also this morning, Harry, about—you know, I think there is general agreement that at a certain point in time, if we continue to grow, we are going to need a second airport. There is no disagreement about that. There is some disagreement about where it should be, what the best location for it would be. My understanding is this, that we will reach projected capacity, at Hartsfield shortly after the year 2000, in ten years. So it seems to me and I wonder if you could just give your feelings on this and the position of the ARC, that if we are going to—that there is a window of opportunity here to begin groundwork on a second airport, because it is going to take some years to construct such an airport. When will that be? How long can we wait before we begin construction, without losing the expansion capabilities, the economic growth that comes with that?

Mr. WEST. Well the study that was completed last year by the Atlanta Regional Commission, the first phase of our second airport study, concluded that we needed to move immediately to install the newer higher technological landing control operations at Hartsfield, the new technology that is available that would allow the air traffic controllers to handle larger volumes of airplanes in shorter spaces of time and distance.

And secondly, that we should move immediately to construct a commuter runway at Hartsfield that would take the small commuter planes that are slow in their landings off of the major runways to allow the jets more frequent use of the existing larger runways.

And if we do those two things, move ahead now, then we will have bought ourselves enough time by expanding the capacity of Hartsfield, to allow for the construction of a second airport. All of these things have to fit together.

We are now in the process of assessing general site locations. There are six different locations being considered now and hopefully by the end of this year, we will have analyzed all of those and provided the results of that analysis to decisionmakers, who can then decide where we ought to go, and get on about building that second airport.

Mr. JONES. Thank you. I know our time is short, we have got a lot of people waiting. I would love to talk more about water, but we are going to be able to do that in late September, in detail. I think we need to demythologize some of the rumors that have been put out about reallocation of Lake Lanier, which is something we simply have to have to continue to grow, and I think that—I want to touch on one other thing, Mr. Chairman.

Recently I had one of the great trips of my life, it was a train trip from here in Conyers to the World Congress Center on the New Georgia Railroad. It was just a beautiful trip, this is, as you know, the old Georgia line out here that was used as a passenger route for many years from Atlanta to Augusta. You touched on the state buying abandoned rail lines and this is being done in many states. I think North Carolina is one of the states that has taken a lead in this, and I just want to applaud that and I think it is something that we need to sort of prioritize and I think we can encourage that in state government. We certainly want to work with you on the Federal level in whatever way we can, because as you know—and you know better than anybody how we have about maxed out in terms of certain highways and we are going to have to start using these rail corridors. I think the rule of thumb is—I forget exactly—but one line of rail is worth how many lanes of traffic.

Mr. RIVES. If you can get people on it.

Mr. JONES. And necessity is the mother of invention.

Mr. RIVES. Right.

Mr. JONES. As we have seen in this past week when the price of oil skyrockets as it has, people were quite willing to hop on MARTA, it is a nicer ride, or hop on a train from here into town. It saves wear and tear on their car, it is a nice way to travel.

I thank you all so much. Thank you, Mr. Chairman.

Mr. RIVES. Thank you for having us.

The CHAIRMAN. Thank you.

Our next panel consists of county commissioners. They are Randolph W. Poynter, Chairman of the Rockdale County Board of Commissioners and Mr. Roy L. Varner, Chairman of the Newton County Board of Commissioners.

Mr. Varner, you are first.

TESTIMONY OF ROY L. VARNER, CHAIRMAN OF NEWTON COUNTY BOARD OF COMMISSIONERS AND RANDOLPH W. POYNTER, CHAIRMAN, ROCKDALE COUNTY BOARD OF COMMISSIONERS

Mr. VARNER. Thank you very much. First of all, down in Newton County and Covington, we try to do things cooperatively and today we have with us the City Manager of the City of Covington, Mr. Frank Turner and I would like for Frank to stand up so everybody will know part of our team because it takes everybody down our way. You will meet our representative to the legislature a little bit later, but all these members of the legislature are mine because they are the ones I am going to be coming to for the needs we cannot get from Washington.

First of all, let me thank you for the opportunity to address you today concerning infrastructure. It is comforting for us in local government to know that our officials in Washington are concerned about the needs. Since I first spoke with Mr. John Ahmann of Congressman Ben Jones' office last week, I discussed with several community officials, including representatives of our municipalities, schools and local hospitals and health care providers. Community consensus seems to indicate major interest in several areas and I would like to take some time at this point to briefly mention these areas.

I am sure that most of the major areas are obvious. The first is the area of water, sewer and wastewater treatment needs. This would include improvements to and extensions of water and sewer lines, the construction of primary and secondary treatment facilities and the development of appropriate tertiary treatment facilities, including land application where feasible.

The second is in the area of transportation system needs. And I think Mr. Rives more or less covered that very adequately. But I would like to point out I think that we have got the greatest Department of Transportation in the United States, as far as cooperation and communication with our local governments.

Other areas of local interest include solid waste issues, education and facilities needs. Major solid waste concerns in the areas of solid waste regulations (Subtitle D made us all turn gray-headed and a lot of us lost it, but we will survive it) and in the utilization of the new solid waste handling technologies. Facilities needs would include schools, health care facilities, recreation areas, libraries and other public facilities.

There is also one interest which encompasses all the above concerns. That is the area of funding. Obviously, all the needs I have mentioned require capital outlay, some quite extensive. We are very appreciative of the funding which has been made available to local governments at the Federal and State level. I understand there are some funds available for airport projects such as the one mentioned earlier. Federal and State education grants have also been utilized quite extensively at the local level. In other areas, however, these grant funds have been quite limited.

There are several options which are available to governments for use in funding capital projects at a local level, and we in the Newton County community have utilized these options. However, it is my opinion that some of the most significant assistance which could be offered by the Congress at this time would be the implementation of a reasonable system of assisting governments with funding and financing of local capital needs.

Most of my counterparts and associates in local government understand that budgetary restraints make grant programs difficult. We do not expect large increases in these grants over the next few years. However, we would be pleased with some type of reasonable loan program, which might offer competitive rates and attractive repayment options. I would personally feel that such a program would be the most significant step the Federal and State government could take at this time to aid in the financing of local capital projects.

In closing, I would like to address one other concern about which we in local government feel strongly. That is in the area of Federal mandates. Specifically, there have been several pieces of environmental legislation which have been adopted over the past few years, such as clean air and water acts. But let me state at this point that I am certainly committed to protecting our environment. It is obviously in the best interest of all citizens of the community to assure that our environment is not harmed.

However, most of this legislation has tremendously stiffened the rules and regulations to which local governments must adhere without providing a source of funding of financing of the increased costs associated with their implementation. Our experience has also been that there is some unnecessary duplication, and in some cases even apparent contradiction in the regulatory phase among the agencies empowered to enforce these rules and regulations. I would also like to express my opinion that these rules and regulations should, as much as possible, be written in layman's language since we at the local level are primarily charged with their onsite implementation.

Undoubtedly local government is indeed where the rubber meets the road. We experience, on a day-to-day basis, the interaction of the constituency with their government. One of the major things my tenure as Chairman of the Newton County Board of Commissioners has taught me is that, no matter what the issue, our goals can only be accomplished through a joint effort of Federal, State and local governments, and with the consent of the constituency. These goals must motivate realization and rationalization in the mind of the constituents in order to be carried out. For it is true that ultimately the constituency does set the agenda.

It has been my sincere pleasure to have the opportunity to address you today.

The CHAIRMAN. Mr. Poynter.

Mr. POYNTER. Chairman Anderson, Congressman Jones, it is with a great deal of pleasure that I welcome you to Rockdale County, Georgia. It is not every day that we are able to witness right here at home the operations of our Congress. I am deeply grateful that you have taken the time to come to Rockdale County and to listen to what we, as elected officials, as private citizens, and most importantly, as Americans, have to say to you.

The infrastructure problems and concerns here are great, as in the rest of the nation. I know that you gentlemen and the complete Committee have a very difficult task in trying to determine what needs to be done to effectively and efficiently meet the requirements of our nation. Today, I am not going into detail about the concerns I have for our area, that will follow in written form.

Mr. Harry West from the Atlanta Regional Commission and our very knowledgeable Commissioner, Mr. Hal Rives, from the Georgia Department of Transportation have already done that. They have expressed to you exactly what needs to be done in the metropolitan area. I know that you will take into serious consideration what they have said and what other witnesses after me will say.

I want to once again thank you for coming to Rockdale County and for allowing us, as citizens, to speak to you on a one-on-one personal level. I look forward with great anticipation to the hearings today and I want you to know that we are counting on each of you to do what is right for our nation.

Thank you.

The CHAIRMAN. Well thank you.

Looking at the infrastructure problem from the local perspective, can you give us some idea of what steps you expect to take to meet your particular needs and what kind of help you expect from the state and the federal government?

Mr. POYNTER. How long a list do you want?

The CHAIRMAN. I have got some paper, I will write it down. [Laughter.]

Mr. POYNTER. All right. Right now we are in the process of doing a comprehensive land use plan for Rockdale County. The ARC, DCA, and other agencies are helping us. That has been an ongoing project for about a year. Rockdale County is going to be the prototype for the Atlanta metro area. We hope to adopt that sometime in the spring of next year. We do not need any help on that right now but we will in the future I am sure, as far as implementing and getting some of the things going on.

Water is the major concern for us down here right now. We have initiated a one percent local option sales tax to raise $8.8 million. As a matter of fact, in about an hour, I have a meeting downstairs with the impoundment authority and we are going to be discussing just that. I do not know if you listened to all the horror stories about what happened to the EPA and the Army Corps of Engineers—I understand we have got an interesting couple of months ahead of us and we might be needing some help on that, I do not know.

After that sales tax expires on that and pays for the funding on that reservoir, we have every hope of imposing or asking the voters to vote in another one percent sales tax for road improvements. You folks are helping us right now on the interchanges, as far as federal dollars go, we need to see that speeded up, if possible. The DOT is doing a great job, I cannot commend them enough. They are doing as much for us as we could ask, but I guess we always want more.

Rockdale County is going to be one of the fastest growing counties in the state and they expect us to double our population in the next 10 to 15 years. As a matter of fact, now that Commissioner Rives is here, I told him that we have a Tom Moreland Interchange, we would like to see some work down in Rockdale County and make it the Hal Rives Interchange, if possible. [Laughter.]

Those are a couple of the needs that are extremely important to us right now. Roads and the interchanges and the water.

The CHAIRMAN. What kind of water?

Mr. POYNTER. We are going to build a 685 acre—we hope to build a 685 acre reservoir. It will provide about 24 million gallons of water a day, it should take us to the year 2030 or 2040.

The CHAIRMAN. A 685 acre reservoir.

Mr. POYNTER. Yes, sir.

The CHAIRMAN. And you will use that for basically what, for irrigation or for servicing cities or what?

Mr. POYNTER. Okay, in Rockdale County, the City of Conyers processes, buys, sells, supplies the water. The county is going to build the reservoir and the city will process the water and supply it to the citizens. It will be a drinking water lake, is what it will be for.

The CHAIRMAN. Ben, do you have something?

Mr. JONES. Yes, I do. I wanted, Mr. Chairman, to follow through on that and I want to compliment you, Commissioner Poynter—Randy—for taking the lead on this thing, and Mr. Roy, I would like for you also to talk about the reservoir in Newton County and this experience because I think it is a prototype.

We are going to, as you know, need every drop of that water and you have shown vision here and gone out and gotten the support of the people to go ahead and do this rather than wait for somebody else to do it at some other level of government.

I was just curious about some of the details on it, because I do think it is something that every county in Georgia probably needs to start considering. I know that part of our Growth Strategies Commission was a series of regional reservoirs, but that is somewhere off in the future too and what we are dealing with now is a reality that people have committed to with their votes.

Of the 8.8 million, how long is it projected before that will be paid off?

Mr. POYNTER. The sales tax started in April and we expect it to take anywhere from 18 to 24 months, although the tax is legally geared to go for 36 months.

Mr. JONES. It will be sunsetted after 36 months?

Mr. POYNTER. Yes, sir, or 8.8 million, whichever comes first.

Mr. JONES. What creek does that come off of, what river?

Mr. POYNTER. That would be the Big Haynes Creek.

Mr. JONES. Off the Big Haynes.

Mr. POYNTER. Yes, sir.

Mr. JONES. And later today, we are going to visit the reservoir in Newton County, which also touches into Walton, and Mr. Roy, I wonder if you would tell us about how that started and how—you know, what the future of that is, how long it is going to serve us, how many folks.

Mr. VARNER. Thank you, Congressman Jones. It would take a long time if I went back through the details and told you exactly how it got started because it was my understanding they were talking water long before I became a member of the Board of Commissioners. But along in 1985 and 1986 when we had the drought, everybody then began to talking realistically about doing something about the water supply. In the fall of 1987, we had a referendum on it, 78 percent of the voters that went out supported it, and we immediately thought all we had to do was run and dam up the creek. It was not long before we found out there was much more too it than that, and in the fall of 1987 is when we finally found out that we had not moved from square one.

But then visiting with the state people, they pointed us in the right direction, to join in with the federal people and in December of that year, we sent out invitations to everybody that we knew that was connected with potable water, surface water, and 100 percent of them responded—not sending a representative, but every one of them came themselves, and we carried them to the site. This is what we want to do, why we need it, we need the water. And I think by early April, we had been able to submit all the documentation that we knew of at the time that we needed in order to get our 404 permit.

We got a commitment that possibly we would get it in July, we did receive it on August 17 of that year—of 1989, it took us until 1989 to get it.

We started work last September a little bit and we are probably two-thirds, half to two-thirds through with the dam, as you will see this afternoon, funded by local option sales tax 100 percent. We are moving along real good and we are going to have to put in a processing plant, which we hope to let for bids next week. Our sales tax—we are right on the edge of the doughnut and we get what Randy and Harry do not need or do not want in a lot of instances——

Mr. POYNTER. Oh, we want it.

Mr. VARNER [continuing]. As far as grant monies is concerned or loans and them kind of things. But we are growing right along and we think our project is coming real well and we represent a constituency down there that will support anything that is reasonable and rational that we can show them the need for.

The CHAIRMAN. Does Rockdale get down to the Gulf?

Mr. VARNER. Sir?

The CHAIRMAN. Does Rockdale get down to the Gulf?

Mr. JONES. No, no, I am going to have to draw you a map, Mr. Chairman.

The CHAIRMAN. You are about half way down, is that it?

Mr. VARNER. I kid them a whole lot, in other words, yes, sir, we are almost in the center of the state. Macon is the center of the state and we are 60 miles north of Macon.

Mr. JONES. See, the Chattahoochee does run on down to the Gulf but we are up in here.

We are eight hundred and what——

Mr. VARNER. Eight hundred twenty acres of water. Regulations are going to force us to have to acquire around 1,200 to 1,300 acres of land to protect wetlands, and I think those are the things that are confusing and frustrating to local people, because I thought if I was covering up 800 acres, I was creating wetland, I did not know I was destroying it until I got way along in the process.

Mr. JONES. We recently had a seminar in the District on the wetlands problem and that is something that we can maybe do down here because several hundred people attended. Commissioner Rives was there, developers were there, there were people there from the EPA and the Fish & Wildlife and Corps of Engineers and the Georgia Conservancy—a major problem in our state, Mr. Chairman, is the wetlands problem.

Mr. VARNER. I think clarification of what is a wetland.

Mr. JONES. Yes, sir.

Mr. VARNER. That is where the problem is. Nobody objects once they understand the justification for the request.

Mr. **Jones**. Yes, sir. I want to thank you all, you have shown great leadership on this issue and you have shown a way for others in our state to follow how this can be done. Now if the good Lord will just give us some rain, we will be all right.

Mr. **Varner**. Oh, we are going to be all right.

Mr. **Jones**. Thank you, Mr. Chairman.

The **Chairman**. Well thank you both, and my thanks particularly to you, Randy, for your kind hospitality this afternoon. Thank you very much.

On our third panel, we have the Honorable C. Dean Alford, State Representative from Rockdale/De Kalb County and the Honorable Thurbert Baker, State Representative for De Kalb County and the Honorable Denny Dobbs, State Representative from Newton County.

Let us start this way, Representative Dobbs, you start.

TESTIMONY OF HON. DENNY DOBBS, STATE REPRESENTATIVE, NEWTON COUNTY; HON. THURBERT BAKER, STATE REPRESENTATIVE FOR DE KALB COUNTY; AND HON. C. DEAN ALFORD, STATE REPRESENTATIVE FOR ROCKDALE/DE KALB COUNTY

Mr. **Dobbs**. Thank you, sir.

Mr. Chairman and my Representative Ben Jones, it is a pleasure to have you in the State of Georgia and in the home district of our fine Congressman. We are proud of the great job Ben is doing and we look forward to his long tenure in Congress very much.

I would like to thank you, Mr. Chairman, and the other members of your committee and other Members of Congress for the service that you are providing, not only to your respective States but also to our Nation. I would like to preface my comments today with three points. First of all, my comments are not intended to indicate that we need any more bureaucracy or a shift away from state lead programs. Also, I fear that as we are looked back on by the folks that come after us, they may view our tenure as caretakers of our Government as being shortsighted, and we certainly do not need to do that.

We also need to plan on a broad basis for as our population grows, the geographic areas expand and the territory actually shrinks and we begin to affect our neighbors more and more. So our planning has to be on a broad basis. Also I would just like to say that controlled, planned growth is called progress and uncontrolled growth is called cancer.

My remarks will be brief. I am sure you have heard many of these same comments across the Nation from other States. I am going to talk about three major concerns in dealing with our infrastructure. I consider our infrastructure to include water supply, wastewater treatment and transportation. Those are the three I will talk about today and I will address them in that order.

Water resources are vital to our growth and well-being. Across the country we have seen over the last several years problems continue to surface in providing an adequate safe drinking water supply. These problems arise not only from a water quality perspective but from a water distribution and treatment side. As State financial resources are stretched by ever-increasing demands from all quarters, it is becoming apparent that we need help from the federal government in developing financing alternatives. These alternatives could include a Federal revolving loan program similar to the one that we have in Georgia that is managed by environmental facilities authority or maybe a grants program similar to the old construction grants program that was in EPA. We also might want to consider requiring all water discharges to be upstream of water intakes. That would probably encourage folks to treat better.

The point is that drinking water supply and distribution is becoming a critical issue financially and environmentally. Wastewater treatment faces the same general set of problems described for drinking water. We have many small wastewater treatment systems that need upgrading and in many cases we need the initial construction, we just do not have the funding to do it. Funding is the critical ingredient and could take the form of loans and grants as mentioned above, and possibly a look at privatization. This may be an appropriate time to consider that alternative.

The bottom line is the same. State financial resources are being stretched and a national plan of action and coordination is needed. As I mentioned earlier, this is not to say that states should not lead the way, it is just to say that we need help in addressing what is becoming a national problem.

Transportation, in view of recent events in the Gulf states, over in the Persian Gulf, are taking on a more serious tone every day. While it is obvious we need to maintain and upgrade our interstate and intrastate systems, I believe it is time that we develop and implement a national policy that seriously encourages alternate modes of transportation. I recently visited Los Angeles, and that is a prime case in point.

Our major emphasis on building more and more roads and bridges in high population density areas is too shortsighted, I fear. Our large cities have demonstrated that you cannot build roads fast enough to keep ahead of the growth in the number of automobiles. Also, our energy and environmental concerns demand that we become more efficient in the use of our energy resources.

Mass transit or mass movement of people is a desired option and this approach needs to be supported and if necessary, subsidized. While it may not work everywhere today, it is a very real part of our long-term solution to the gridlock we are facing in more and more cities across our country.

For the final point, I believe our rail systems must be preserved, and I have listened to several speakers before me echo that concern. For environmental and energy reasons, these are very efficient ways to move materials and people.

In the long term, rail traffic offers desirable features and we must look 25 or maybe even 50 years ahead.

I want to thank you for the opportunity to address you today and we are just happy to have you in Georgia.

The **Chairman**. Thank you, Representative Dobbs. Representative Baker.

Mr. **Baker**. Thank you, Mr. Chairman. Let me also take the opportunity to welcome you to the State of Georgia. It is certainly always good to see my Congressman, Representative Ben Jones. I appreciate the opportunity to also discuss with you my perspective on infrastructural needs.

As you know and most of you realize, infrastructural needs have put a tremendous strain on the purse strings, not only of the State but of local governments. Each of us I think realize that a sound infrastructure is essential to the long-term economic growth, both of Georgia and its cities.

I would like to talk to you about several infrastructural issues, in particular solid waste, wastewater, water supply, hazardous waste, highway, mass transit and aviation. I would like to just touch upon those briefly.

Let me say at the outset though, as a philosophical matter, that I believe the problems that we are seeing with infrastructural needs and how we are going to deal with them must come about through a cooperative effort I believe from the Federal Government, the State government and of course local governments. Possibly from a federal standpoint, we could look at low-cost tax-free financing and other grant programs. From a state standpoint, maybe we could consider some increased funds to the Georgia Environmental Facilities loan fund and more state appropriations. From local government we could possibly consider increased ad valorem taxes combined with local user fees, all put together in a joint effort to address our infrastructural needs.

Let me first of all touch upon solid waste. During the past session, the general assembly of this State passed a revised Solid Waste Management Act, which I believe holds promise to provide an approach to this State's solid waste dilemma. There is a negotiations process built in there where a facilitator will support resolution of siting disagreements, which always seem to be a problem.

However, landfill system improvements in Georgia will cost in excess of $100 million. De Kalb County has approximately 24 months in remaining permitted capacity and I am told requires a minimum of $1,110,000 for solid waste system improvements. Likewise, Fulton, Rockdale and Newton County will require some $3,860,000 in improvement with remaining capacity from a low of nine months to a high of 64 months. Presently this cost projection of $100 million is answered by $1.2 million in state grants with no Federal support.

In the area of water supply, the issue of supply has been addressed in part through the Growth Strategies Commission efforts for water reservoirs. But this action only addresses north Geer has really stressed our system. In fact, Alabama and Florida have entered into court litigation to prevent the diversion of water flowing from Georgia to their states.

In the area of wastewater, the need for new and plant expansion transport systems and sewer rehabilitation combined with sewer overflow problems will cost a minimum of $670,380,000. Compare that with the State Water Pollution Control Revolving Fund which only has $30 million in it and you can readily see the problem. Several projects in De Kalb County alone will spend nearly $5 million, that being the Nancy Creek relief, the Pole Bridge project and the Upper Snapfinger wastewater treatment project. These things continue to strain our infrastructural system, just from a sheer dollars standpoint.

In the area of hazardous waste, we are presently studying issues of hazardous waste management through a joint House-Senate committee and will report those findings and recommendations to the 1991 general assembly of this State.

Moving quickly along to the area of transportation and mass transit, MARTA is expanding and certainly promises some metro relief relative to highway and road congestion for the commuter. I heard mention earlier of the situation in the Mideast and the unstable problem we have there. That obviously is going to show up in our gas prices which continue to provide a strain on the system. Cost to expand rail lines is tremendously expensive, as you know, and will require a combined federal, state and local approach.

Aviation, Hartsfield Airport, I think Congressman Jones mentioned earlier, is presently operating near capacity. The fifth runway or the addition of a fifth runway, will alleviate some congestion but a second regional airport, Mr. Chairman, I would submit, serving flights originating or ending in Atlanta, is needed.

Highways, Georgia is committed to rural highway development for economic and social reasons. We are designing an outer perimeter right now beyond I–285 and widening major highways through congested areas. We are, however, facing a problem with bridges that have been declared unsafe. This presents an additional strain on our dollars. That must be considered in the context of a slowing economy here in Georgia, where we will be called on to decrease our budgets somewhere in the range of $300 to $400 million, due primarily to over-projection and a sluggish economy.

Mr. Chairman, members of the panel, I think sometimes in our complex society, we tend to skew the obligations of government at almost any level. I think, however, that our basic and foremost duty is to provide the basic services for the citizens of this state and the country, and that certainly involves providing a sound infrastructure system. We would certainly like to work with you and hope to have your support in doing that here in the State of Georgia.

Thank you for your time.

The **Chairman**. Thank you.

Representative Alford.

Mr. **Alford**. Thank you, Mr. Chairman. I too would like to express my appreciation for you being here today and listening to comments and to Congressman Jones. Always his staff has been willing to work with us and we appreciate that very much.

I will keep my comments brief and into three general areas that I think the infrastructure needs that have been highlighted today; drinking water, solid waste and waste water, recognizing there will be hearings at a future time on the drinking water issue, let me just say to you that the reservoir program that is being implemented in this state is moving forward but right now the wetlands situation facing the Environmental Protection Agency is making that very difficult to move forward. But funding of those projects continue to be a difficult part because it comes out of state funds entirely and we are hoping for somewhere in the neighborhood of $200 million of state funds to build these programs.

However, the reallocation of Lake Lanier is without a doubt the most critical water issue in this state. If we do not have reallocation, the metro area will begin to experience negative economic impact by the year 1994. It is the most crucial thing facing the metro area at this time.

Also, I would like to add that sometimes I think we are quick to spend money to build new facilities and have been slow to give money for projects that are on the, if you will, demand side, the conservation side. We have been quick to provide money to build more reservoirs, but we have been slow to fund programs that would put in more water conservation devices. I applaud Rockdale County recently for changing the code for new construction and I think a major role for the Federal and State levels is to provide just as quick financing to help implement technologies that reduce the demand for water as we put money in place to build new water supplies.

In the area of wastewater, this State right now has on its books requests for $670 million of wastewater facility projects. In 1985, the Georgia General Assembly developed the Georgia Environmental Facilities Authority where we put funds in loans to local governments. I want to compliment Congress and this committee for allowing the State of Georgia to receive $30 million a year to match the dollars we have put forth. To date, we have funded 202 projects to the tune of $118 million. But as you well know, the $30 million from the federal program will stop right now tentatively in fiscal year 1994. Not only do we need those dollars to continue, but we are willing to match at the state level those dollars. The requirement, as you know, is 20 percent. Right now we are putting $13.5 million and at this rate alone we will not meet the needs. We think loan programs are good, they are working, right now we are receiving somewhere in the neighborhood of repayments of 99 projects to the tune of $5 million a year. If we could get more money in the form of loan payments where we could build these wastewater treatment facilities, it would be helpful.

Last year we turned down 128 projects. For every three projects we receive in the state to fund, we have to turn down one. And as we move into the 1990s, protecting our environment is very important. Wastewater treatment and drinking water are all tied together.

In the area of solid waste, today 195 permitted sanitary landfills serve 98 percent of Georgia. However, in the past five years only 18 permits have been issued. Today we are seeing landfills being filled quicker and quicker every day and we have to have programs to allow local governments—last year the Environmental Protection Authority asked funding for loan programs for landfills. We were not able to do that because of a shortfall. We need some dollars to put into a loan program once again for our solid waste.

Our local governments have been more than willing to participate in programs of this nature. They are not asking for a give-away, they are asking for a helping hand, a helping hand at interest rates that they can afford, because right now the need on local governments is not going to be because of tax increases, but the money to pay for water and solid waste is going to outstrip any kind of tax increases we have ever seen.

And so as you go back to Washington, we at the state level want to work with you, but it is going to have to be in such a way that it is going to have to be at dollar levels that make a difference. The $30 million has been wonderful and we appreciate that, but we just simply need more. And we are willing to do that on a loan basis.

Once again, let me commend you for your efforts. We applaud the efforts that brought you here to hear our needs. We know your task is great and we thank you very much.

The **Chairman**. Thank you very much.

What priority do you fellows give to public facility projects and how do you see their impact on the economy and development within your State?

Mr. **Alford**. Well I will jump on that by saying I think the top priority has to be drinking water. You have heard the numbers about the growth. The Chattahoochee River, while we would like to be close to the Gulf, Mr. Chairman—for years after I moved my wife from Mobile, Alabama, I used to have her convinced that we were close, but the Chattahoochee River is a very, very small basin to serve this city. You could not have chosen a worse place to put a metro area. And we need drinking water very bad. And we are dead serious when we say by 1994—we are not talking about the year 2000, 1994, we are going to experience negative economic impact if we do not have the reservoirs and reallocation.

Mr. **Baker**. Mr. Chairman, I would certainly agree with that and that seems to be our primary concern here in the state. As I mentioned earlier, the Growth Strategies Commission that was spearheaded by the Governor of this state a few years ago and continues to be a priority in this state, was set up to address that water problem. However, we are going to have to do some additional things to make sure that we have got water and an adequate supply of it, to carry this state through the 1990s and into the year 2000. So I would agree that is a major concern at this point.

The **Chairman**. Mr. Dobbs.

Mr. **Dobbs**. Drinking water.

The **Chairman**. Ben.

Mr. **Jones**. I would have to concur, Mr. Chairman, if I might venture an opinion. I will make a minor speech here if I get started on it. But we know we have all these needs, these transportation needs and these other infrastructure needs. But if you do not have water, you do not have anything. And this reallocation is vital to the continued growth, not just of this region, but I think of the southeast, because there is a domino effect. And I think it would be short-sighted for people frankly downstream of Atlanta to not recognize that their own economic future is tied inextricably to the economic future of Atlanta. And we do have to have water first of all.

I would like to thank all of you. Once again, we do not have the time to fully discuss this. I can simply promise you that we will do all we can from the federal level. You know, when we talk about—the popular phrase recently when everybody is looking for funds for this or that project, no matter what it would be, well we can get it from the peace dividend. That peace dividend has already been spent about 400 times over.

But what I think—you know, I have always said that if there is such a thing, the first thing it should go to is deficit reduction which will bring down interest rates and stimulate this economy in other ways that would provide us with a base to do these things. But I think at the same time, we have to have now a clear national energy policy that is linked to a national transportation policy that is linked to a clear vision of a national infrastructure rebuilding policy and all those things are inextricably linked and that it is incumbent upon the leadership in Congress and the White House to define that because the economic future of this country and our ability to compete internationally is tied to that. And I do not think it could have been any better stated than we have just heard it from some very fine public servants, and I just want to thank them.

The CHAIRMAN. Thank you very much.

[The prepared statement of Mr. Baker appears on p. 1286.]

The CHAIRMAN. Our next panel is composed of Mr. Alan Yorker, Vice President of the Georgia Association of Railroad Passengers, and Mr. J. David Chesnut, member, Board of Directors of Metropolitan Atlanta Rapid Transit Authority.

I do not know which one to call on first—Alan Yorker or J. David Chesnut. Mr. Yorker, okay, you are it.

TESTIMONY OF ALAN M. YORKER, VICE PRESIDENT, GEORGIA ASSOCIATION OF RAILROAD PASSENGERS AND J. DAVID CHESNUT, MEMBER, BOARD OF DIRECTORS, METROPOLITAN ATLANTA RAPID TRANSIT AUTHORITY

Mr. YORKER. Mr. Chairman, Congressman Jones, gentlemen, guests, as a citizen of the Fourth Congressional District of Georgia who has been advocating legislative support in the United States Congress for passenger rail transportation over the past 12 years, I thank you for this opportunity today to present my views. I appreciate the significant role that this committee has played in helping keep passenger rail transportation modes alive during difficult times of federal budgetary prioritization. I believe this committee has acted wisely to maintain a vital transportation network and to also set the stage for transportation viability into the future.

The passenger rail network in the United States, which has been most efficiently operated of recent by AMTRAK, and the networks underlying infrastructure, are true national resources. Congress has guaranteed their existence over the past 18 years. In that time, Americans have rediscovered the usefulness and sensibility of rail travel and are returning in ever larger numbers to ride passenger trains. As AMTRAK continues to approach economic self-sufficiency in its operations, due to both public demand and excellent management, it is clear that capital investment in passenger rail will be necessary to continue the regrowth of this mode and to ensure that passenger rail technology is in place to meet the demands of the 21st century.

The benefits of passenger rail transportation are without dispute. It is fuel efficient, therefore economical, safe, environmentally superior to other modes, convenient due to its infrastructure access to all regions and areas of the country, both urban and rural, and proven. Like all transportation modes, however, it requires capital investment in modern equipment, maintenance and improved performance. Restored service to lines once served, such as the midwest to Florida routes, are acknowledged needs. Coordinated service, such as the combining of inter-city AMTRAK service at Penn Station in New York City is economically sound and operationally efficient, yet it requires capital funds to effect. Creating intermodal stations of transportation, such as those in Harrisburg, Pennsylvania; Hartford, Connecticut; Santa Ana, California, make good sense and prove popular with travelers, but they also require significant investment.

We are at a turning point in United States transportation policy. We have the opportunity to educate and assist the American citizen in preparing for the next century by supporting transportation modes which will be ever more useful and necessary. By investing sooner rather than later, we save billions of dollars and we create a transportation network to handle the needs and priorities of future generations. Similar investments by our western allies and our newer eastern bloc friends are because of their understanding of such foresighted planning and not because of a romantic attachment to passenger trains. The businessmen of our country in the northeast corridor, for instance, are flocking to passenger trains and are outstripping the supply of seats between New York and Washington. Family travelers in this country are fully booking long distance trains months in advance for the four month summer travel period. Many trains are near capacity year round, such as the New York to Florida lines.

Attention now turns, therefore, to funding sources. Annual subsidy allocations, even at diminishing levels, require a politically wasteful process, in their requirement of placing the various transportation modes in direct competition with each other. A new policy, based upon a national transportation trust fund is being advocated by some congressional passenger rail supporters, AMTRAK's leadership and the National Association of Railroad Passengers, of which I sit on the Board of Directors. A single penny of gasoline tax allocated to passenger rail would supply AMTRAK wit its capital needs indefinitely, and considering passenger rail's fuel efficiency, safety, and environmental soundness, the penny would seem well deserved. Modes of transportation that are the most expensive and fuel-demanding would therefore help support modes that are the most efficient and economical. This scheme would work toward more balance and budgetary responsibility. This economic plan would allow long-term planning in the passenger rail mode, enable AMTRAK to keep up with its resource needs, depoliticize the funding mechanism for AMTRAK and passenger rail and contribute to federal deficit reduction.

Our nation's railroad system is the largest in the world, but it is not at its operational optimum. Many lines and their invaluable rights-of-way are in danger of being lost to the years of neglect while we flirted and fell in love with newer modes of transportation; namely planes and super highways. As we come to once again realize the value of what we already have and its importance for the future, we must not let these assets be lost forever, as some unfortunate areas of our country have already done, such as Los Angeles and its once great streetcar and inter-urban line network. Protecting routes and rights-of-way is another sound investment for the future that will more than repay us back. We will make significant use of these resources in the not too distant future.

A last note I would like to make is in reference to the current administration's interest in magnetic levitation research as it relates to passenger trains. Magnetic levitation is a not altogether proven technology for massive network and intermodal development. However, it may prove adequate and feasible, or not. It it worth examination. However, high speed passenger rail technology already in place in the world is equally as efficient and useful, such as the French TGV system, which is compatible with existing older technologies. Reaching speeds in excess of 300 miles per hour provides excellent functionality for the foreseeable future and then some.

In closing I would like to just say that in spite of the apparent benefits from investment in the rail mode, our State of Georgia Department of Transportation insists that such plans for development are far too premature. Clearly an appropriate role for the Federal Government would be to offer leadership and guidance to the various states in promoting a transportation policy which will include all appropriate modes of moving our citizens, not merely the modes with which we are most accustomed and familiar. I believe the time to incorporate passenger rail into the national transportation plan has come. Rail transit, urban, suburban and inter-city projects are good for the people, good for the economy, good for the welfare of Georgia and good for our country.

Thank you.

The CHAIRMAN. Mr. Yorker, when you referred to Los Angeles, you looked at me. [Laughter.]

You obviously did not know that about three or four weeks ago, I was one of the dedicators of a big new blue line that goes from the Long Beach area all the way to Los Angeles, up about two stories high all the way, so it is not one of these that has problems. I must admit that as of today we can only go from the Long Beach area to Los Angeles, but we are also building one that goes from Los Angeles out to the San Fernando Valley and to West Los Angeles and another line to the Los Angeles Airport and also east to Orange County and we will have hopefully within the year so we can go almost anywhere in Los Angeles on fast transit. So I just want you to know, as bad as we have been, we are trying to do better.

Mr. YORKER. Your predecessors, not you, sir.

The CHAIRMAN. Oh, OK.

Mr. YORKER. Our national newsletter covered the opening of the line.

The CHAIRMAN. I made six speeches along the opening of it.

Mr. YORKER. I commend you for your involvement.

The CHAIRMAN. Mr. Chesnut.

Mr. CHESNUT. Thank you, Mr. Chairman, and along with all the others, I want to welcome you to Georgia and say how much we appreciate the opportunity to appear before you.

Last August I had the pleasure to speak at a public hearing on the National Transportation Policy. Not discounting the high priority that Americans have traditionally placed on personal mobility, I argued for rational and balanced transportation policies. Our nation's mobility is almost totally dependent on highways and automobiles. This is a one-sided policy that has put our nation at risk.

The events of the past week in the Mideast have once again pointed up the inevitable consequences of our nation's massive dependence upon foreign sources of oil. We Americans must curb our insatiable appetite for personal mobility. Otherwise, our economic and political independence will always be held hostage to events like those which have occurred in that part of the world.

As we turn to address this current crisis, we should use it as an opportunity to educate the American public on the advantages of alternative modes of transportation. To show them that to preserve and ensure our nation's mobility, each American must be willing to sacrifice some of their personal mobility by traveling in a vehicle other than their single-passenger car.

To some extent, the inexorable laws of economics will soon take over and as the price of gasoline and oil rises, more people will seek alternative forms of transportation. But what do we do when our population turns to these other transportation modes and they do not exist? That is the concern that I have often expressed and the one that is underlined by our current events.

We need national transportation policies that will encourage the planning, construction, expansion, rehabilitation of alternative modes. I would suggest now, as I suggested then, that we call for a substantial increase in motor fuel taxes to pay for investments in transportation infrastructure. While bridges and road will require part of that investment, other transportation modes like public transit, rapid rail and commuter transit, should be given due weight when they are deemed appropriate alternatives.

Yes, it will require a sacrifice on the part of all Americans, but we will be investing in our own future rather than just paying higher prices artificially created by the oil cartels.

The Atlanta region has begun the business of building an alternative transportation system that is less dependent on foreign oil, reduces traffic congestion and is friendly to the environment. The system is MARTA. Since 1971, MARTA has been aggressively implementing a regional transportation—bus and rail—system for metropolitan Atlanta. The system currently serves the urban heart of the eight county region where more than 50 percent of the population resides.

We have a record of service to the community that is unmatched, but MARTA must reach out to counties in the metropolitan area as yet unserved and provide the mobility necessary to a healthy regional economy. Such regionalization of MARTA will also spread the infrastructure needs and will not concentrate them in one area. MARTA can continue to expand its service area and these expansions are currently under construction—the north line, the east line and the northwest feeder line. Other corridors in the region are being assessed for their rail transit potential and still others are yet to be studied.

The Atlanta region's population—you have heard the growth figures—but Harry West's figures show that we currently stand at 2,364,000, expected to reach 3,865,000 by 2010. A major expansion in the transportation infrastructure will be required to support that growth.

MARTA along is only part of the answer—or mass transit is only part of the answer—to the region's alternative transportation system. A complete vision would see a commuter passenger rail system that would provide access to the urban hub for the growing population in suburban areas. A well planned commuter rail system feeding into an efficient MARTA system would serve to distribute the commuters throughout the region and could provide the needed alternative transportation system to the metropolitan area.

Commissioner Rives has mentioned one line to the northeast. There is another line which is currently being appraised to the south, which is being—in the process of being abandoned by the Central of Georgia Railroad, that should likewise be purchased.

The benefits of such a system would include removing vehicles from the roads and interstate highways, increasing the efficiency and functional life of our highways, reducing vehicle emissions which cause air pollution, and providing an energy efficient mode of transportation making us less dependent upon foreign oil.

Such systems are not built overnight, nor will it be easy to wean Americans from their well-known love affair with the automobile. But we need policies at the national, state and local level that will assist us in providing these systems and will encourage and reward those who are willing to abandon their cars in favor of public transportation.

Mr. Chairman, my thanks to you and the other members of this Committee for being here, and I will be happy to answer any questions you might have.

[The prepared statement of Mr. Chesnut appears on p. 1294.]

The CHAIRMAN. Yes. We have survived about nine years now of cuts in operating assistance, engineered by the federal administrations. What would you see as the impact in this region if federal transit and rail subsidies were eliminated?

Mr. CHESNUT. Let me answer that, Mr. Chairman. I think that the MARTA system is one of the few systems, or few rail properties as they are known in the Nation, which has traditionally provided a reserve for replacement and repairs. We have compensated for that cutback in federal operating assistance by not being able to fund our reserve and using the interest income from that reserve to subsidize fares. Now that is a policy which is going to ultimately bite us in the rear and it is going to bite us bad, so bad we are not going to be able to sit down when we do not continue to fund this reserve for replacement and repairs.

So that is what has happened to the system in Atlanta.

The CHAIRMAN. Mr. Yorker, do you want to comment on that?

Mr. YORKER. Well generally, I would like to say that investment in the rail modality stretches a dollar a lot further to move the citizens of our state and country. And one of the problems about funding in this state is that the Transportation Department looks to Washington for all funding for projects of this kind. I think it is important that we lobby our state governments to begin to consider these modes so that we do not expect the federal government to be building entire new systems of rail, but to cooperate with us the way they have cooperated with MARTA. MARTA's putting up one penny tax has done a lot I think to encourage the federal government to play ball with us.

In terms of inter-city rail, however, we have not been putting up anything. Our state government does not seem willing to consider putting up a penny of gas tax or anything else. I would like to see some encouragement from the federal government for states to begin to invest in their own rail infrastructure at a higher level.

The CHAIRMAN. I pointed out that we have survived roughly the last nine years of cuts in operating assistance by the federal administration—it has just been cutting them. Now if they go beyond that and eliminate the transit and rail subsidies, that might even be worse, I do not know. Now you came in with kind of a substitute idea there, but——

Mr. CHESNUT. Well sir, all I was trying to say is that we have absorbed those cuts by cheating other areas of the operation. And you can only go so far with cheating. We have got a new system here, just as you have in LA, got basically a new rapid transit system. Well you can cheat it for so long but then when you cheat it, you are going to be dealing with the same situation which you are presently dealing with in New York City where you are having to go back in and rebuild a system. And as you well know, they had no funds up there to do the rebuilding themselves, when they should have been allocating monies for what you would, in the private sector, refer to as depreciation, and you would be funding a reserve for depreciation and repairs, to come back and—and we are not going to let the system go down, do not get me wrong, we are not doing that. But those new cars out there can only last for so long and there will come a time—if you look at the situation in Pittsburgh where they have refurbished the old trolley cars. They have refurbished those cars at a million dollars a car, that is what it has cost them to refurbish the trucks, the total infrastructure.

So we have cheated—and I believe that I am correct, I would not say this for absolutely sure, but I believe we are the only property in America that has even tried to reserve against that. So we had this reserve to fall back on. We have run out of that now and we recently increased the fare from 85 cents to a dollar. We have a 1 percent state subsidy and it goes 50 percent to subsidize operations and 50 percent for our proportionate share of the bonding capacity for construction.

But we have run out of sources of funds. We have got to go find some more funds.

The CHAIRMAN. Ben, I think I will hand that to you. [Laughter.]

Mr. JONES. Thank you, Mr. Chairman.

As both of you know—I think you know—I grew up in a railroad yard from a railroad family. Some might say I was born in a boxcar, but I was—I am from that tradition and one who believes very much in rail travel and I travel to Washington quite frequently on the Crescent. It is a great trip.

We are at a critical point right now, I think, in that as we point out, it would be nice to have right now but it is not there. And so it is—are we willing to make that investment in the future, to create an intermodal rail system such as you describe. We here in Atlanta are in a unique situation, Mr. Chairman, this town was built on railroads. There is a railroad line that runs from here to anywhere in the United States. This was the rail capital of the southeast before it became the air capital of the southeast, this area. But we are not using that rail to move people with.

The question I think is going to take a leap of faith and maybe dramatic circumstances such as we have seen recently to help us understand. But as you know—and I do not know if Commissioner Rives is still here or not, but traditionally state departments of transportation,—highway departments—have been very jealous of that highway fund and they do not really see rail as a public alternative, but rather a private—excuse me, go ahead.

Mr. CHESNUT. In the Chairman's state, they recently approved an increase in the motor fuel tax, a portion of which went to rail. I think what Alan and I are both advocating is an increase in the—why should the increase in the fuel—and we and Canada are the only two nations in the world where gas is under $2 a gallon. Why should we subsidize the war in Iran——

Mr. JONES. That was as of 3:30. We might go out and check again. [Laughter.]

Mr. CHESNUT. Well, that is right, as of 3:30.

Why should we subsidize that when we can be subsidizing our national transportation policy. That is the question, Mr. Jones.

Mr. JONES. You are preaching to the choir here. I absolutely agree with you.

Mr. YORKER. We had a very interesting and somewhat embarrassing local experience recently when the federal Railroad Administration in the Bush administration, a Republican, came to Atlanta to talk to city officials and rail interested parties about a new intermodal rail station for Atlanta and caught everyone in the city off-guard except the chamber of commerce in being unprepared with a plan with what this city and State and metropolitan area were going to do. It left everyone saying "gee, Mr. Carmichael, that is a good idea, but we did not know you were interested in that." I think it is wonderful that federal administrators are getting interested in that and going out to cities and states and metro regions and saying we will help you with this, but what is your game plan, guys. You live there and you are part of that community. We need to have those plans and we need the leadership and encouragement that is coming from Washington to continue that. We need to have Mr. Rives know that you believe in Washington that people do ride trains and that his belief that they will not ride them and do not ride them is outdated by 20 years.

Mr. JONES. Well I cannot speak for him, but I think it would be beneficial. Hopefully maybe I can do this at some point, is have a hearing about the future of rail here and we can bring some more folks, some more public attention to it.

David, I would like to say that one of the privileges of this job that I have had is every year going to the Appropriations Committee to brag about MARTA. It is one of the best run rapid rail systems in the country and it is because of good management. We understand the pinch you are in and you are doing a good job and of course, Alan, I want to see us develop a reasonable and rational and visionary rail policy in this country.

And I want to thank you both for coming today to testify.

The CHAIRMAN. I think Mr. Chesnut liked what you said.

Mr. JONES. I meant it. [Laughter.]

The CHAIRMAN. The final panel is as follows: Ms. Joy H. Bauer, Executive Director of the North Fulton Chamber of Commerce; Ms. Annie Hunt Burriss, Vice President of Economic Development in De Kalb; and Mr. Robert Maddox, President of the Rockdale Chamber of Commerce.

Mr. Maddox, a while ago, I said ladies first and I introduced a lady first, but this time you are out-numbered, so why do you not go first.

TESTIMONY OF ROBERT W. MADDOX, PRESIDENT, ROCKDALE CHAMBER OF COMMERCE; JOY H. BAUER, EXECUTIVE DIRECTOR, NORTH FULTON CHAMBER OF COMMERCE; AND ANNIE HUNT BURRISS, VICE PRESIDENT OF ECONOMIC DEVELOPMENT, DE KALB CHAMBER OF COMMERCE

Mr. MADDOX. Chairman Anderson, Congressman Jones and members of the panel, ladies and gentlemen, good afternoon. I am Robert Maddox, I am a partner with the law firm of Maddox, Starnes and Nix here in Conyers, Georgia. My appearance here today is on behalf of the Conyers-Rockdale Chamber of Commerce where I serve as President for this year, 1990. On behalf of the 780 businesses that belong to the Chamber, I would like to welcome you to our community and thank you for the opportunity to express our views on the state of the infrastructure in Conyers and Rockdale County and its effect on our economic future.

I believe that Conyers and Rockdale County present a unique challenge in the metropolitan Atlanta area. Ours is a community that is both urban and rural, it is modern and traditional, blue collar, white collar, bustling and also slow-placed. Our proximity to Atlanta has made Rockdale County one of the most popular bedroom communities in the state. Yet at the same time, a growing number of businesses and industries moving into our area increases the number of people who are both living and working here.

The population of Rockdale County in 1990 approaches 55,000. Since 1970, the county has experienced a growth rate of more than 168 percent. The Atlanta Regional Commission projects that in the year 2000, our population will surpass 85,000 people.

Rockdale County's dramatic growth began in the mid-1970's when our nation's transportation network was the envy of the rest of the world. The completion of Interstate 20 in the 1960's literally paved the way for this growth. But today, our nation's transportation network faces a gridlock crisis. This crisis is a result of six major trends: Suburban development, economic relocation, demographic and labor force changes, increased automobile use, reliance on trucks and a lack of infrastructure investment.

We must invest in the transportation system that has brought us this far. Industrial prospects visiting Rockdale County list our proximity to Hartsfield Airport, the Georgia rail system, the seaports of Savannah as top factors that would attract them to our area. Our lifeline to these resources is a strong interstate and highway system.

For that reason, we are urging you to stop the diversion of motor fuel taxes for non-transportation purposes such as deficit reduction. Continuing this practice would turn any highway trust fund into just another general revenue program.

The people of Conyers and Rockdale County are concerned about transportation needs. What were once rural highways through our community are now bustling avenues of commercial activity. Georgia Highways 138 and 20 are in desperate need of traffic improvements and we are currently working with the State Department of Transportation to ensure that everyone's best interests are considered. The public is willing to pay for transportation improvements, but they are not willing to see these funds used as a catch-all for budget shortfalls.

Of course, there are other concerns with infrastructure which need to be addressed. Water is one of these. A new reservoir is planned for north Rockdale County and that is expected to help meet our water demand needs into the next century. Also, the City of Conyers has started a recycling program and this is a good example of what every community should be doing to help manage waste and to protect our environment.

Our city and county officials are working together to meet our future demands as economic and residential growth continues.

In my opinion, we have a partnership to uphold. Local, State and Federal Governments should work together with the private sector to ensure a higher level of productivity and a good quality of life for Conyers, Rockdale County and the entire nation.

Thank you, Mr. Chairman.

The CHAIRMAN. Ms. Bauer, I think you are next here.

Ms. BAUER. Mr. Chairman, Congressman Jones and counsel, I want to thank you for this opportunity and honor to address you. My comments will be brief. As much as I would like to talk specifically about north Fulton County which is the northern most part of Fulton County, I feel it is more important and critical to talk about the region as a whole.

The CHAIRMAN. I have got down here North Fulton Chamber of Commerce.

Ms. BAUER. Yes.

I feel that the infrastructure issues with regard to economic development do not just stop at the north Fulton County boundaries and lines, they cross jurisdictional boundaries. I would like to read my comments, if I may.

The economic future of the Fourth District, which we are a part of, metro Atlanta, the State of Georgia rests on continued economic development. Economic development cannot continue or thrive unless the needed infrastructure is in place to support this growth. The lack and condition of our current infrastructure not only affects the Fourth District and north Fulton County, but affects the entire region and the State of Georgia. Particularly with what is happening in the international marketplace, we will be facing much more competition and a broader base of competition through the 1990s.

The demand for our region's resources, both natural and manmade, is great. These resources include Hartsfield International Airport, the Chattahoochee River, Lake Lanier, MARTA public transportation system, sewer treatment facilities and a vast road system. We have and are approaching this through regional cooperation with the Atlanta Regional Commission, the Governor's Growth Strategies Commission and numerous other partnerships crossing those jurisdictional boundaries.

If I may divert from my testimony for a moment, we are just now embarking on the Mansfield Road interchange which is taking place in north Fulton County. It is a new interchange just north of the Holcombe Bridge interchange on Highway 400, which is U.S. 19. As I mentioned to you, the partnerships and the public/private partnerships which are critical for economic development is a good example. It is a $9 million plus investment in north Fulton County and Georgia, $4 million of that being from the federal government, $4 million including land donation from the private sector and the remaining dollars coming from the counties and the cities and the state.

To this cooperation and vision, the Fourth District inclusive of north Fulton, the metro area and the State of Georgia are a good sound investment for both business and residents. Economic development, as we know, creates jobs, a strong tax base, which provides the needed quality of education, health care and assisting the local governments with the quality of life services that they must provide. Through the Governor's Growth Strategies Commission and the Department of Community Affairs, Georgia, again inclusive of the Fourth District, north Fulton and metro Atlanta, must have the ability to fund the needed infrastructure improvements and expansion to ensure our future. But more importantly, I feel it has come to the point in the 1990's that it is going to be to really ensure our survival.

I want to thank you for the opportunity.

The CHAIRMAN. Ms. Burriss.

Ms. BURRISS. Mr. Chairman, Mr. Jones and counsel, thank you for the opportunity to come and speak before you. We commend your efforts to examine the infrastructure needs of Georgia's Fourth Congressional District and how that is going to affect our future.

I am going to deviate from my notes, but I would like it to be reflected that we were environmentally concerned and we put ours on one page, front and back.

Economic development, which is what my business is—I am Vice President of Economic Development for the De Kalb Chamber—economic development is based on three things; leadership, location and infrastructure. So I would like to talk about the three things. A critical thing—not in my testimony—is De Kalb which is 100 percent in the Fourth Congressional District, is a community of 550,000 people. We have 330,000 jobs in our county and there are 22,000 businesses. So within 269 miles we have more population and jobs than several states in the union.

We are fortunate in the first category of leadership. Our Congressman is one we are very pleased with and he has been most helpful to us and very good to respond to our needs, and he looks ahead to the future. That is what we are all committed to in economic development, is developing a vision of what we are and what we can be, and he has been most helpful in that leadership role.

Infrastructure is the critical element that we hang all of our economic development on, and so I would like to address three particular aspects of that, but cast it within this light. I think from a city planning standpoint and the development of the United States, what we have been seeing in the last couple of decades and will be seeing in the future is the rise of the city state, a massing, an urbanization of our country. And as such, that means local governments because of what has happened in the last decade, where funding has shifted from the federal level back to the state and back to the local level, there are a lot of responsibilities that have been heaped on the local level that were formerly assumed by federal leadership. And the rise of the city state I believe caused the federal government to look at that role. Since it is not just rural areas and populations are massing together, I think that there is a federal responsibility in looking at that.

Number one, water supply and quality. You have already heard from Harry West, so I will not go into all that detail that is in my statement here, but we have got adequate water supply to 1995, speaking for this district only. The water and sewer capacity is the one thing that is going to limit our growth. We do not have a mountain range, we do not have an ocean, it is water and sewer. If more water is not made available, there will be a million less people and 680,000 less jobs in Georgia by the year 2010, unless that is dealt with. So there is some legislation that we believe Mr. Jones represents us well on, but we appreciate your support.

In De Kalb County, we are by far the most blessed of all the counties in metro Atlanta. We have 30 million excess gallons of both water and sewer capacity. That is because of a partnership between the county of De Kalb, local leadership, state leadership, but definitely federal dollars. We were blessed to have leadership that took advantage of the programs that were available in the 1950's, 1960's and 1970's. Our adjacent counterparts in Gwinnett and Cobb and parts of north Fulton, they do not have the advantage of those federal programs that were in place a decade ago. That is to my advantage just from the De Kalb basis, but De Kalb has always taken a regional perspective, which is what you are doing.

Solid waste—we we are all very environmentally concerned right now. We would like to see Public Works encourage ways to encourage recycling and to make that something that becomes part of the national priorities. For example, the average American generates over three and a half pounds of waste every day; in Georgia, that is four pounds. I do not know what that says about us Georgians, but that number is increasing. And again in De Kalb, we have solid waste disposal capacity through 2020, but that is because we have had good leadership to look ahead. But I would like to see the Federal Government encourage local leadership to make some decisions on that, and I do not know how that is done. I will look to your wisdom on that.

The third primary area of public works that we are definitely concerned with is transportation. We have been blessed with that in De Kalb County. We enjoy more miles of interstate than any county in the state. We have taken a leadership role in trying to look to the future, we began collecting sales tax for MARTA in

1971. Our county generates over 13 percent of all the sales tax collected in the whole state of Georgia, so that is a considerable effort.

Every day we have got 26,000 people that get on the east line of MARTA, and that is 26,000—or 24,000 if you want to average it out a little bit—less cars that are on the streets, that means less road demand. In fact, the city of Decatur, which is the only city besides downtown Atlanta, that has a MARTA station right in the middle of it—it has consistently the lowest vacancy rates in metro Atlanta. As soon as we get a building up in there, we are full of occupancy, and a lot of that is due to the MARTA station.

But when you look at our MARTA parking lots in De Kalb, since we are on the periphery of expanding areas of metro Atlanta going out the east line and the north line, you will see that De Kalb's contribution supports the region. You will see a lot more cars with Gwinnett and Rockdale license plates on it, than you will De Kalb in our periphery stations.

So in summary, we appreciate you bringing this prestigious group to our District and we appreciate the opportunity to speak. It is critical—Atlanta has been a Cinderella city, we have not had a recession really since 1975, and everybody from Texas to California and New York has come here and invested and we have got a lot of surplus space right now. But because our basic infrastructure is good, with the airport and with the MARTA system, and the many amenities that Atlanta offers, we believe that fundamentally we are sound. But please—I guess the final request I would make is you have established great wisdom in trust funds that is the fairest way to pay for systems, and we would encourage that that money be spent for the reason that it was collected and not just to keep the deficit looking lower than it is.

Thank you.

[The prepared statement of Ms. Burriss appears on p. 1292.]

The **Chairman**. Thank you very much. I was going to let Ben go first, but I saw how nice you were in your comments here and he would have to spend much of his time thanking you and so—he can still do that, but in the meantime, I was going to ask a question for the three of you.

What are the most critical capital investment needs for this area of the state and which, on a benefit/cost basis, would have the greatest impact on your local economies.

Ms. **Bauer**. I will be glad to speak first. For the state, I see definitely water, sewer and a public transportation system. For north Fulton immediately, that would be water and sewer. We have been in a sewer moratorium through the summer and we are perceived, because there is a lot of growth in north Fulton, that it is tough to get water and sewer permits for long-term growth. So we feel that is an immediate need for the north Fulton Community.

The **Chairman**. And would that have a great impact on your local economies?

Ms. **Bauer**. Most definitely. North Fulton was considered a part of that crescent that was supposed to be the fastest growing area of the country. We have had a lot of wonderful growth and we are privileged with a wonderful quality of life. However, a lot of that planned growth are things that are waiting to happen, cannot go forward until they can get their sewer permits and make sure they are going to have adequate water service, which they were without for a short time this summer.

The CHAIRMAN. Any other comments on that? Ms. Burriss.

Ms. BURRISS. In the first place, narrowly, it would be transportation. If you cannot move people and goods, nothing is going to happen. When I spoke of the rise of the city state, as an example in De Kalb County, if we had $30 million extra dollars for right-of-way acquisition, that would access $200 million in state and federal funding for road improvements. And because we are picking up a lot of other infrastructure costs such as indigent care and a variety of other services that are no longer funded by the federal government, just $30 million help, which you used to provide a decade ago, would improve the quality of life, improve energy—reduce energy consumption, improve the environment. Water and sewer would be next but fortunately we are sitting well but the region really needs some assistance in that.

The CHAIRMAN. Do you have any comment, Mr. Maddox?

Mr. MADDOX. I would simply echo that water is our big concern here in Rockdale and the reservoir that is being considered for north Rockdale has got to be the long-term top priority for Rockdale County.

The CHAIRMAN. At this time, I think I will call on Congressman Ben Jones, who has been such an effective spokesman for this District.

Mr. JONES. Thank you, Mr. Chairman, you read it just like I wrote it. [Laughter.]

I want to do a couple of things. First of all, I want to thank this panel and all panels who have appeared today. You have given your time to illuminate us, the Committee staff, the Chairman, on our needs here.

Mr. Chairman, I represent the most exciting and I think dynamic Congressional District in the United States. The Fourth District is the most—I have said this a lot, but it is true—it is the most educated Congressional District in the southeast, it is the most affluent—of course it follows the education—but it is also the most diverse Congressional District in the southeast. And we have seen in our different counties we have slightly different needs, we have different politics, we have different styles and we have a great cross-section. This District is urban and suburban and ex-urban and rural and ethnically diverse, economically diverse. But we do have some common needs and I think we have laid those out for you here today.

This is the fastest growing area in the nation and we do have these needs, and this area here, this Fourth District, is sort of the engine that drives the southeast, I think we can say. We just want our share. As has been pointed out many times today, there are billions of dollars which are sitting in trust funds, not being used for the purposes that we paid into those funds for. We need that money back now to continue this tremendous prosperity, to continue this growth. And that is what this country—I think it was Calvin Coolidge said the business of America's business. Well that is what we are about here.

I want to thank everyone here. I also—for De Kalb County, I would like to say also that Chairman Manuel Maloof, who has been a great leader in De Kalb County, was not able to be with us today because he is hospitalized.

I noticed, Mr. Roy, awhile ago we were talking about the need for rain and it clouded up and had thunder and the pond is filling up. While we are praying, we will say a prayer for Manuel too.

I just want to thank you, Mr. Chairman and thank this Committee, and I will turn it back over to you.

The **CHAIRMAN**. I was just going to—I do not want to correct you because I know you are never wrong—you people are terribly lucky to have such a wonderful guy——

[Applause.]

The **CHAIRMAN**. He does, as he said, have the fastest growing district in the country. About three or four years ago, I was making speeches around the country and they were on this same thing, but I identified my area as having a problem and I said my Congressional District, but a little beyond it I am told that we are going to have three and a half million more people by the early 1990's than we have today. This got pretty good press and then several of the big governments in California sent a delegation of about five people back to me to meet with me and let me know it was not three and a half million, it is five and a half million. So I changed my remarks to five and a half million. And about three or four weeks ago, I was again brought up to date, it is now seven and a half million. And that is not the end.

Now if you have got seven and a half million plus people coming into your Congressional District or your area, you get an idea what I am up against.

I will not ask anyone to comment on it. [Laughter.]

Is there anything anyone else would like to ask these people here? I do not have any specific questions. I do know that we are kind of pushing for time to get us—there is a plane waiting for us to get us someplace—oh, we are going to look at the reservoir first.

I think then I will close it up. I want to thank all the witnesses who appeared before us today for their excellent statements.

This was a good and productive hearing. The testimony we received will be helpful to us as we work to put together a national infrastructure program.

Ben, I want to compliment you on putting together this hearing, and your staff for their efforts in helping things to run smoothly.

And to those here, I want to reiterate what a super job Ben is doing on your behalf in Washington. He is becoming a leader on water issues and I know that I will do whatever I can to help him help you to meet your particular needs. And I am not kidding, I am going to help you, but you are going to have to work on me a little bit.

Mr. **JONES**. I will work on you.

The **CHAIRMAN**. I want to thank you all very much, and I think probably with that—unless you want to say something——

Mr. **JONES**. No, thank you.

The **CHAIRMAN**. Thanks to all of you. The meeting stands adjourned.

[Whereupon, at 4:15 p.m., the Committee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

PRESENTATION TO THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE
UNITED STATES CONGRESS

HONORABLE GLENN M. ANDERSON, CHAIRMAN
BY
THURBERT E. BAKER
STATE REPRESENTATIVE
DEKALB COUNTY, GEORGIA

CHAIRMAN ANDERSON, MEMBERS OF THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE, AS A MEMBER OF THE STATE HOUSE OF REPRESENTATIVES SERVING FROM DEKALB COUNTY WHICH IS WITHIN CONGRESSIONAL DISTRICTS 4 AND 5, I AM EXTREMELY PLEASED TO SHARE MY PERSPECTIVE ON INFRASTRUCTURAL NEEDS IN THE 4TH AND 5TH DISTRICTS. CONGRESSMEN BEN JONES AND JOHN LEWIS HAVE BEEN EFFECTIVE SPOKESMEN FOR THE 4TH AND 5TH DISTRICT AS WELL AS THE ENTIRE STATE AND WE APPRECIATE THEIR ACTIONS ON OUR BEHALF. MOST OF YOU PRESENT TODAY REALIZE THAT THE TREMENDOUS GROWTH EXPERIENCED IN GEORGIA AND SPECIFICALLY WITHIN THE METRO AREA, HAS STRAINED AN AGING INFRASTRUCTURE BEYOND OUR PRESENT ABILITY TO EFFECTIVELY MAINTAIN, REPAIR OR RENOVATE THE SYSTEM.

EACH OF US REALIZES THAT A SOUND INFRASTRUCTURE IS ESSENTIAL TO LONG-TERM ECONOMIC GROWTH. WE ALSO REALIZE THAT THE HEALTH OF OUR CITIZENS DEPENDS, IN PART, UPON WATER AND SANITATION FACILITIES WHILE OUR TRANSPORTATION SERVICES AND

HIGHWAY SYSTEMS CONTRIBUTE TO THE ECONOMIC AND SOCIAL WELL BEING OF OUR STATE AND CITIZENRY. I REALIZE THAT LOCAL GOVERNMENT LEFT TO RELY UPON ITS OWN SOURCES OF REVENUE CANNOT ADEQUATELY RESPOND TO THE DETERIORATING INFRASTRUCTURE WITHIN THE FORESEEABLE FUTURE. HOWEVER, A COOPERATIVE PARTNERSHIP BETWEEN FEDERAL, STATE AND LOCAL GOVERNMENTS, WITH PRIVATE BUSINESS AND CITIZENS, CAN ADDRESS THIS NEED. IF THE FEDERAL GOVERNMENT WOULD ALLOW STATE AND LOCAL GOVERNMENTS THE RIGHT TO OBTAIN LOW COST TAX-FREE FINANCING AND PROVIDE OTHER GRANT PROGRAMS, IF THE STATE WOULD PROVIDE INCREASED FUNDS FOR THE GEORGIA ENVIRONMENTAL FACILITIES LOAN FUND, PROVIDE STATE APPROPRIATIONS TO MAINTAIN AND EXPAND THE INFRASTRUCTURE AND PROVIDE SPECIAL WASTE FEES, AND IF LOCAL GOVERNMENT WOULD DEDICATE INCREASED AD VALOREM TAXES COMBINED WITH LOCAL USER FEES, THEN WE COULD REBUILD AND MAINTAIN OUR INFRASTRUCTURE.

NOW, ALLOW ME TO BE MORE SPECIFIC. I WILL BRIEFLY ADDRESS SEVERAL INFRASTRUCTURAL ISSUES WITHIN THE 4TH AND 5TH CONGRESSIONAL DISTRICTS THAT RELATE TO SOLID WASTE, WASTE WATER AND WATER SUPPLY. ADDITIONALLY, I WILL TOUCH UPON HAZARDOUS WASTE, HIGHWAY, MASS TRANSIT AND AVIATION.

- SOLID WASTE

DURING THE PAST SESSION, THE GENERAL ASSEMBLY PASSED THE REVISED SOLID WASTE MANAGEMENT ACT WHICH HOLDS PROMISE TO PROVIDE AN APPROACH TO THIS STATE'S SOLID WASTE DILEMMA. THE NEGOTIATIONS PROCESS, WRITTEN IN THE ACT, PROVIDES FOR A FACILITATOR TO SUPPORT RESOLUTION OF SITING DISAGREEMENTS BETWEEN GOVERNMENT, BUSINESS, AND CITIZEN GROUPS WHICH WILL HELP TO OVERCOME NIMBY (NOT IN MY BACK YARD). HOWEVER, LANDFILL SYSTEM IMPROVEMENTS IN GEORGIA WILL COST IN EXCESS OF $100,000,000. DEKALB COUNTY HAS APPROXIMATELY 24 MONTHS IN REMAINING PERMITTED CAPACITY AND REQUIRES A MINIMUM OF $1,110,000 FOR SOLID WASTE SYSTEM IMPROVEMENTS. ADDITIONALLY, FULTON, ROCKDALE AND NEWTON COUNTIES (4TH AND 5TH CONGRESSIONAL DISTRICTS, EXCLUDING DEKALB) WILL REQUIRE $3,860,000 IN IMPROVEMENTS WITH REMAINING CAPACITY RANGING FROM A LOW OF 9 MONTHS TO A HIGH OF 64 MONTHS IN ONE OF FULTON COUNTY'S FOUR SITES. THESE COST RELATE TO NEW SITE AND HORIZONTAL EXPANSION, VERTICAL SITE EXPANSION OR SITE UPGRADE. PRESENTLY THIS COST PROJECTION OF $100 MILLION IS ANSWERED BY $1.2 MILLION IN STATE GRANTS WITH NO FEDERAL SUPPORT. IT SHOULD BE NOTED THAT THE AVERAGE AMERICAN GENERATES OVER 3.5 POUNDS OF WASTE EACH DAY. IN GEORGIA, THE NUMBER IS 4 POUNDS, AND THAT NUMBER IS INCREASING.

- WATER SUPPLY

PRESENTLY, WE DO NOT HAVE AN ADEQUATE DATA BASE TO PROJECT STATE AND LOCAL COSTS TO REPLACE DETERIORATING OR INSUFFICIENT STORAGE AND DISTRIBUTION SYSTEMS. THE ISSUE OF SUPPLY HAS BEEN ADDRESSED, IN PART, THROUGH THE GROWTH STRATEGIES COMMISSION EFFORTS FOR WATER RESERVOIRS BUT THIS ACTION ONLY ADDRESSES NORTH GEORGIA. AS YOU MAY BE AWARE, THE INCREASED REQUIREMENTS FOR WATER FROM LAKE LANIER NEEDED TO SUPPLY THE METRO ATLANTA AREA HAS RAISED ECONOMIC, POLITICAL, AND ENVIRONMENTAL CONCERNS. IN FACT, ALABAMA AND FLORIDA HAVE ENTERED COURT LITIGATION TO PROHIBIT THE DIVERSION OF WATER FLOWING FROM GEORGIA TO THEIR STATES. THIS MATTER IS PRESENTLY IN NEGOTIATIONS WITH HOPE OF RESOLUTION OUTSIDE OF THE COURT. ADDITIONALLY, THERE IS A NEED OF UNDETERMINED EXPENSE, YET PREDICTABLY SIGNIFICANT, WHICH WILL REQUIRE INCREASING RATES, IN PART, TO MEET PURITY STANDARDS OR SOURCE CONTAMINATION, IF PRESENT.

- WASTE WATER

THE NEED FOR NEW AND PLANT EXPANSION, TRANSPORT SYSTEMS AND SEWER REHABILITATION COMBINED WITH SEWER OVERFLOW PROBLEMS WILL COST AT MINIMUM $670,380,560. RECIPIENT SELECTION FOR WASTE WATER PROJECTS THROUGH THE STATE WATER POLLUTION CONTROL REVOLVING FUND (SRF) HAS BEEN LIMITED BY THE AVAILABILITY OF ONLY $30 MILLION. IN FACT, GEORGIA ENVIRONMENTAL FACILITIES AUTHORITY HAS PROVIDED $10

TRAFFIC CONTROL SYSTEM. HOWEVER, IT IS EVIDENT THAT CONGESTION HAS RESULTED IN FLIGHT ACCIDENTS AND NEAR MISS DISASTERS. PEACHTREE-DEKALB AIRPORT IS PRESENTLY CONDUCTING A NOISE POLLUTION STUDY THROUGH A 90% FEDERAL GRANT. THE RESULT OF THE STUDY WILL DICTATE NEEDS. EXPANSION OR OTHER SUCH IMPROVEMENTS ARE NOT PRESENTLY UNDER CONSIDERATION, BUT NOISE ABATEMENT MAY REQUIRE CHANGES IN OPERATIONS OR FACILITIES.

HIGHWAYS

GEORGIA IS COMMITTED TO RURAL HIGHWAY DEVELOPMENT FOR ECONOMIC AND SOCIAL REASONS AND HAS DEVOTED DESIGNATED AND GENERAL FUNDS TO HIGHWAY AND ROAD CONSTRUCTION. WE ARE DESIGNING AN OUTER PERIMETER BEYOND I-285 AND WIDENING MAJOR HIGHWAYS THROUGH CONGESTED AREAS. THE EXPENSE IS SHARED BETWEEN FEDERAL, STATE AND LOCAL ENTITIES. HOWEVER, ANTIQUATED BRIDGES THROUGHOUT GEORGIA HAVE BEEN INSPECTED AND MANY DECLARED UNSAFE. THIS BRIDGE REPLACEMENT NEED WILL AGAIN BE AN EXPENSE ADDED TO THE ALREADY OVERBURDENED STATE AND LOCAL REVENUE RESOURCES. CONSIDER THESE INCREASED NEEDS DURING A SLOWING ECONOMY WHICH WILL CALL FOR A DECREASE OF APPROXIMATELY $300-400 MILLION IN THE PRESENT BUDGET (DUE TO OVERPROJECTION AND SLUGGISH ECONOMY) AND YOU CAN READILY RECOGNIZE WE ARE FACED WITH THE DOUBLE EDGED SWORD OF HAVING TO REDUCE THE BUDGET ON ONE HAND AND ON THE OTHER HAND, MEET

INFRASTRUCTURAL NEEDS THROUGH INCREASED FUNDING REQUIRED TO IMPROVE ECONOMIC CONDITIONS.

IN DEKALB COUNTY, WE MUST RAISE FUNDS FOR TRANSPORTATION IMPROVEMENTS. THIS MONEY IS NEEDED TO PURCHASE RIGHT-OF-WAYS AND RELOCATE UTILITIES. AGAIN, THE UNMET NEED FOR IMPROVED ROADS, TO ALLEVIATE AN INCREASINGLY CONGESTED TRAFFIC SITUATION, IS STEMMING ECONOMIC GROWTH AND CONTRIBUTING TO HIGHER LEVELS OF CITIZEN FRUSTRATION.

YES, WE NEED FEDERAL SUPPORT IN PARTNERSHIP WITH STATE, LOCAL, BUSINESS AND CITIZEN COOPERATION IF GEORGIA, AND THE 4TH AND 5TH CONGRESSIONAL DISTRICTS, ARE TO SUCCESSFULLY MEET THE INFRASTRUCTURAL NEEDS REQUIRED TO SUPPORT ECONOMIC GROWTH, IMPROVED HEALTH, SOCIAL AND POLITICAL WELL BEING.

THANK YOU AGAIN FOR INVITING ME TO SPEAK TO YOU. I WILL BE HAPPY TO FORWARD ADDITIONAL INFORMATION, SUPPORTED BY APPROPRIATE DATA IF DESIRED.

DEKALB
CHAMBER OF COMMERCE

Presentation to the Public Works and Transportation Committee

U.S. Congress

by Annie Hunt Burriss, Vice President - Economic Development

August 8, 1990

The DeKalb Chamber of Commerce commends your efforts to examine infrastructure needs of Georgia's Fourth District and how these needs will affect future economic growth in our region. Congressman Ben Jones has been an effective spokesman for his district, and we appreciate his actions on our behalf.

Water Supply and Quality

Time is of the essence in resolving the water supply crisis in the Atlanta area. With water conservation programs and normal rainfall, the Atlanta area will have an adequate supply until 1995 without additional water allocations.

The Atlanta Regional Commission has estimated that if more water is not made available, there will be 1 million less people and 680,000 less jobs in Georgia in the year 2010 than under ARC's current projections. Less people and less jobs translates into large losses in wages earned within the state and in gross revenue collected by the State of Georgia. ARC estimates $127 billion less in wages and a lost gross revenue to the State of Georgia of $8.2 billion (1986 dollars) between 1995 and 2010. More than 85 percent of this loss would occur in the Atlanta area.

We must have a regional approach to our water supply system. First, we should maximize the use of the area's existing reservoir by reallocating Lake Lanier for water supply purposes. We should support efforts to establish a regional reservoir system to provide for future water needs. And we must promote water conservation to more wisely use our water resources.

Assuring an adequate supply of water is not enough. We must also assure that the quality of the water is maintained for use in homes and businesses, in recreational areas for fishing and swimming, and in the wetlands and recharge areas.

Solid Waste

The average American generates over 3.5 pounds of waste each day. In Georgia the number is 4 pounds, and that number is increasing. This is over 1 pound per day more than the average German, who lives in an equally industrialized nation.

Reduction of waste must be encouraged, through recycling and creating less waste. Recycling markets must be strengthened to provide an outlet for the collected recyclable goods.

750 Commerce Drive, Suite 201 Decatur, Georgia 30030 U.S.A. Fax 404-378-3397 404-378-8000
ATLANTA'S LEADING EDGE

Alternate disposal methods to landfills should be examined and encouraged, including incineration and waste-to-energy facilities. Pricing of waste disposal should more realistically reflect its true cost, including the cost to the environment.

Transportation

Transportation demands within the Atlanta area are too complex to be served by a single solution---a balanced transportation system is needed to completely address transportation requirements.

Roads and highways continue to be an essential component of our transportation system. Many of DeKalb's roads are operating above capacity now, and growth in the next few years will increasingly tax these roads. According to the Georgia Department of Transportation, it is a county-wide problem, with Ashford-Dunwoody Road in the north, to Redan and Rockbridge Roads in the southeast.

High occupancy vehicle (HOV) lanes increase the people-carrying capacity of our highways. Carpools and vanpools can be used effectively in urban and rural areas to more effectively use our existing facilities. Encouraging flexible working hours will spread peak hour demands over a longer time period.

Mass transportation plays an important role in a balanced transportation system. DeKalb has supported the MARTA transit system since 1971, when DeKalb and Fulton counties became the first counties in the nation to voluntarily pay for a mass transit system. Voters passed a referendum approving a 1 percent local sales and use tax to fund MARTA.

We in DeKalb have benefitted greatly from MARTA. The 26,000 riders entering stations on the East Line in DeKalb County daily would otherwise be sitting in 26,000 cars in congested traffic on our streets. MARTA service has had a role in the increased investment in our county. The city of Decatur has a downtown MARTA station and the lowest office vacancy rates in metro Atlanta.

The public transit systems in Georgia operate over 1,200 transit vehicles in 11 counties. Support for their operation and expansion must continue. Commuter rail must be explored as a means to connect distant suburbs with the cities and their concentrations of jobs.

A balanced transportation system can be achieved by more realistic prices for gasoline, lessening the public subsidy of personal automobile travel, and by authorizing the expenditure of gas tax monies for all modes of surface transportation, not just roads and bridges.

As the nation becomes increasingly urban, serving the transportation needs of our urban areas becomes increasingly a national priority. The Atlanta area's transportation system serves not only the immediate Atlanta urban area. Parking lot surveys at MARTA stations show a large number license plates from counties outside the MARTA counties.

The construction of a second regional airport is of primary concern to the Atlanta region and the state as a whole. Our superb air transportation access has been a primary reason for our region's growth. We must begin soon on the construction of a second regional airport to adequately serve our business needs.

Thank you for this opportunity to speak on how important infrastructure is to our continued economic growth.

TESTIMONY PRESENTED

BEFORE THE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

BY

J. DAVID CHESNUT
CHAIRMAN, DEKALB CHAMBER OF COMMERCE
MEMBER AND FORMER CHAIRMAN OF MARTA BOARD OF DIRECTORS
750 Commerce Drive
Decatur, Georgia 30030

AUGUST 8, 1990

WELCOME

My name is David Chesnut. I am Chairman of the DeKalb Chamber of Commerce. I am also a member and former Chairman of the Metropolitan Atlanta Rapid Transit Authority. On behalf of DeKalb County and MARTA, I want to welcome you, Mr. Chairman, and the members of the House Public Works and Transportation Committee to the 4th Congressional District. As we sit here in Rockdale County, we are at the eastern edge of the Atlanta Metropolitan Region. The growth in this metropolitan area is pressuring our infrastructure and our transportation facilities are especially strained. We are an integral part of the region's economic system and our future is inextricably linked with the rest of the Atlanta Region.

HISTORY AND OVERVIEW

Increasingly, the Atlanta Region is attracting greater numbers of guests from around the nation as well as from around the world. The City has become a Mecca for conventions and trade shows. We successfully hosted the National Democratic Convention and are scheduled to host the 1994 Superbowl. Atlanta is in close competition and, some say, leading the bid to host the 1996 Olympics. Atlanta is also in the running as the U.S. host for the 1994 World Cup Soccer competition. Many of our guests come for a visit and decide to stay and make their homes in the Atlanta Region. The Atlanta Metropolitan Area is one of the fastest growing regions in the nation.

The quality of life in our region has done much to attract the economic development that drives our growth. In many respects the quality of life is dependent on the adequacy of our infrastructure and rapid transit is considered a vital part of that infrastructure. Recognizing how vital mass transit is to the economic and social well being of this community, voters in the City of Atlanta and Fulton and DeKalb County approved a comprehensive public transportation plan in 1971. The document set forth plans for bus improvements as well as construction of a rapid rail transit system.

At that time the voters also imposed upon themselves a 1% local option sales tax to pay for these improvements and the new rail system. Additionally, that same year the transit system was awarded the largest single grant ever given to a new transit system by the Urban Mass Transportation Administration. This was the genesis of the Metropolitan Atlanta Rapid Transit Authority - MARTA. Through MARTA the citizens of the Atlanta region can document nearly two decades of commitment to local funding support for mass transit and to the local - federal partnership upon which our success so clearly rests.

MARTA is an independent single purpose agency created by the Georgia General Assembly to plan, build and operate public transportation in Metropolitan Atlanta. At the present time the System serves the three most populous jurisdictions in the Atlanta Region: the City of Atlanta, DeKalb County and Fulton County. (Very limited service also extends into Cobb, Clayton and Gwinnett Counties.) All of the 5th Congressional District is in the MARTA service district as well as a substantial portion of the 4th Congressional District.

Since 1971 MARTA has made numerous capital and service improvements involving the Bus System: new equipment; new Maintenance and operating garages; passenger shelters; new bus routes; improved frequencies; extended operating hours; improved schedule information; etc. In addition, MARTA has been aggressively implementing the rapid rail transit plan.

The present operating system includes 1,500 route miles of bus service, 32 miles of rapid rail lines and 29 passenger stations. Average weekday ridership equals approximately 495,000 trips. Annually, MARTA provides 45.5 million vehicle miles of bus and rail service to the citizens of the Atlanta Region. One hundred and fifty million passengers board the combined system annually and ridership increased by 3.5% during FY1990.

TRANSPORTATION INFRASTRUCTURE AND SERVICE

As with other forms of infrastructure, MARTA supports the needs of the community and strives to provide excellence in transportation service to all of our patrons. MARTA has integrated bus, rapid rail and special service vans to provide appropriate levels of service throughout its service area.

Service on the Bus System

MARTA became operational with the purchase of the Atlanta Transit System's buses and facilities in 1972. Since then the bus system has been critical in providing direct transit service for patrons throughout the Metropolitan Atlanta area as well as providing feeder bus service for the rail line as it has developed.

Our buses operate 30.0 million miles annually. There are 681 buses in MARTA's active bus fleet not including the 36 buses operating under contract to he Authority. There are 150 bus routes which together form an operating system of 1,543 route miles.

MARTA's safety record is unsurpassed by any other transit authority. In fact, MARTA has been declared the safest transit system in the United States eleven times and the safest in the North American continent four times in the past fifteen years.

Service on the Rail System

As approved by the voters in 1971 and as subsequently amended, the MARTA Rail Plan calls for 60 miles of heavy rail lines, 45 stations and 33,000 parking spaces. The proposed network includes two main trunk lines that intersect in the Atlanta Central Business District; four rail branches; one feeder rail line; and one busway (See Attachment #1).

MARTA has been building the rail system in phases, giving priority to those phases which promise the greatest return on investment or which are given priority for reasons of construction staging or operating efficiencies. MARTA has in service 32 miles of track, 29 stations and 17,000 parking spaces. All of Phases A and B (See Attachment #1) are in service as well as all of Phase C except the extension from Chamblee to Doraville.

MARTA has under development at the present time twelve miles of track and six stations. This includes the last part of Phase C -- two miles of track and the Doraville Station. This portion is 40% complete and is scheduled to open in December 1992.

The remainder of the MARTA System that is currently under development is Phase D which consists of ten miles of track and five stations. It includes three lines: 1) extension of the East Line from Avondale through Kensington to Indian Creek -- three miles of track and two stations; 2) construction of a branch feeder line in the Proctor Creek Corridor -- between the Ashby Street Station and Bankhead Highway -- one mile of track and one station; and 3) the North Line from Lindbergh Station to the Medical Center -- six miles of track and two stations. All of Phase D is under development -- detail design, land acquisition as well as construction. Revenue service to Bankhead is scheduled to begin in mid-1992; to Kensington and Indian Creek in mid-1993; and to Buckhead and the Medical Center in mid-1995.

The total current estimated cost of Phase D is $449.9 million, of which the Urban Mass Transportation Administration (UMTA) is providing $135 million or 34%. All federal funds are being applied to the East Line extension from Avondale to Indian Creek. The feeder line in the Proctor Creek corridor and the North Line to Medical

Center are being built with local funds.

When Phase D is completed in the mid-90's, MARTA's rail operating system will consist of 44 miles of track and 35 stations. UMTA is providing $1.5 billion or 53% of the $2.9 billion cost. The local share is $1.4 billion or 47% of the cost.

Service to the Elderly and Handicapped

MARTA has a long history of service to our patrons with special needs, our elderly and handicapped citizens. In 1976, the Elderly and Handicapped Committee was created and MARTA's commitment to providing lift buses and special services to this group of patrons was formalized.

Two years before the Americans with Disabilities Act was signed, MARTA - working with its E & H Committee - formulated and adopted the policy that 50% of the bus fleet would be fully accessible to the elderly and handicapped by 1992 and that 100% accessibility would be achieved by the year 2000. The rail system including all of the rail passenger stations are already completely accessible to these special patrons. Additionally, MARTA has contracted with a private company to provide limited scheduled and demand responsive lift van service for those special patrons who cannot avail themselves of the regularly scheduled transit operations.

Service through Intermodal Linkage

Service to our patrons is also enhanced by maximizing opportunities for intermodal linkages and interfacing with other systems. The system is designed to facilitate transfer between MARTA's bus and rail components.

An intermodal link also exists between intercity bus and the rapid rail system. The Greyhound Bus Terminal is within easy walking distance to MARTA. Plans are underway to improve this linkage by building a new terminal in conjunction with a MARTA rail station.

Undoubtedly MARTA's most successful intermodal linkage is represented by our airport rail station which is in the heart of the baggage/ground transportation area of Hartsfield International Airport.

When the Airport Rail Station opened in the summer of 1988, the average weekday patronage was 7,300. This station has seen a steady increase in patronage. In June 1990, average weekday patronage was 9,500 which is a 30% increase since the opening of the station.

Part of the airport station ridership increase comes from travelers residing outside of Georgia. Thus MARTA has become an intermodal extension to the Atlanta airport as it brings business people and tourists into the State of Georgia.

Service through Interface with Other Systems

In July 1989, MARTA entered into a reciprocal free transfer arrangement and cooperative operating plan with the new Cobb Community Transit (CCT) system. Under this agreement, individuals are allowed free transfers between MARTA and CCT services, and operating procedures were implemented for enhanced customer convenience.

The transit ridership level and regional mobility have clearly benefited from this agreement. CCT ridership has exceeded all expectations with the system's greatest usage route being on CCT local Route 10, connecting the City of Marietta and Cobb County's densely developed Cumberland/Galleria area with the MARTA Arts Center Station. Individuals travelling from Cobb County into the MARTA service area and vice versa have been well served by this connection as demonstrated by CCT Route 10 where 43.5 percent of the riders are Fulton and DeKalb residents travelling to destinations in Cobb County.

Transit Service and its Direct Benefits to the Economy and the Environment

MARTA's mission statement, A Standard of Excellence, has as one of its by products the attraction of riders to the transit system. Our striving for excellence not only benefits the regional economy but also has immediate positive impacts on the regional environment.

Many direct economic benefits accrue to the region as a result of MARTA's activities. MARTA employs more than 3,300 people full time and almost 500 part-time workers. The multiplier effect of the rail construction dollar is 3.5 times the direct investment which means that the $2.8

billion spent for rail development programs has contributed about $9.8 billion to the region's economy.

As growth and expansion continue, traffic congestion has become endemic to certain part of Metropolitan Atlanta. This local experience contributes to the fulfilling of the U. S. Department of Transportation projection that more than 7 billion gallons of fuel will be wasted because of traffic congestion by the year 2005.

Traffic congestion adds to the region's problem with air pollution. Motor vehicles contribute 40% - 60% of the hydrocarbons that produce our ozone and smog problem, and cause 70% - 80% of our carbon monoxide emissions. It is estimated that one person using mass transit for a year instead of driving to work saves our environment 9.1 pounds of hydrocarbons, 62.5 pounds of carbon monoxide and 4.9 pounds of nitrogen oxides.

In return for the region's support for MARTA, the Authority offers an alternative transportation mode which is energy efficient, reduces traffic congestion, and has a positive impact on the environment. Every bus full of passengers at rush hour removes 55 cars from our congested highways and every rail car removes 125 cars from traffic.

THE FUTURE OF TRANSIT IN THE ATLANTA REGION

MARTA stands on a record of successes in the provision of transit infrastructure to the citizens of our community. We are proud of the transit system being built in the Atlanta region and thankful for the community support and vision that established a dedicated source of local funds to support it. The service that MARTA has been able to provide to the citizens of Atlanta area as represented primarily in the 4th and 5th Congressional districts has been made possible by the strong local - federal partnership that the members of this committee have sustained. Continued federal financial support for alternative modes of transportation and sensitivity to the impact of federal mandates on local transit systems is vital to the future of transit in the Atlanta region.

As we approach our immediate future, MARTA's first priority and need is to complete the 60 mile rail system approved in the original 1971 referendum and subsequently amended. As we pursue this goal, we must also assess developments within the region to identify new corridors where mass transit is justified and needed. One of these corridors is the North Atlanta Corridor.

Extension of the North Rail Line

Congressional support has already been forthcoming for MARTA's North Line Extension which is needed to link the transit system currently serving the Atlanta region with the North Atlanta Corridor.

The Metropolitan Atlanta Region is one of the most robust urban areas in the United States. The current population is 2.2 million, up from 1.8 million in 1980; employment is 1.2 million, up from 881,000 in 1980. In 2010, the region's population will reach 3.7 million and employment 2.4 million.

The North Atlanta Corridor is the fastest growing corridor in the region. Property that was developed commercially ten to fifteen years ago is now being redeveloped to higher densities (See Attachment #2).

The 1980 Census reported a population of 147,619 for the North Atlanta Corridor, or eight percent of the seven-county region's total. Since 1980, the area has experienced a 61% increase in population to 237,000.

Employment has increased 119%, from 53,059 to 116,500. By the year 2010, population in the corridor will be 431,000; employment will be 270,000.

The central portion of the corridor is becoming a dense urban center which will soon rival downtown Atlanta. Sixteen million square feet of commercial space exist now or are under development in the central portion of the corridor. Just north of the core another 30 million square feet of space exist or will be developed. This accelerated growth has resulted in significant traffic congestion and delays. At the same time, there is an increasing demand for public transportation to transport workers from the central city to jobs in the corridor.

Thus the MARTA North Line is the next logical phase of MARTA development. The line (See Attachment #1) branches off the Northeast Line in the vicinity of Lenox Square, one of the largest regional shopping centers in the metropolitan area. Two stations and 5.7 miles of heavy rail will be built in conjunction with a major highway improvement (GA 400). The rail line from Buckhead to Medical Center, estimated to cost $230 million, will be fully financed with local funds. Construction is already underway.

Extending public transit improvements further into the North Atlanta Corridor is considered by Atlanta region officials to be a matter of top priority. It is a corridor of rapidly expanding job opportunities with major arterials and feeder streets operating at, or above, theoretical capacity levels. Moreover, public transportation improvements are needed in order to adequately serve patrons who have no other means of travelling to and from this job-rich corridor.

The Draft Environmental Impact Statement has been submitted to UMTA and MARTA is anticipating approval for preliminary engineering work in late August.

The current estimated cost of the project -- Medical Center to North Springs -- is $499.9 million. This estimate does not include the cost of preliminary engineering but does include funds to purchase additional rail vehicles.

MARTA expects to request a federal financial commitment to the project of $374.9 million including $52.5 million earmarked last year by congress. While this represents 75% of the cost of the extension, it represents only 53% of the cost of the total 8.8 mile, five station North Line.

The addition of the North Line to the MARTA Rail System will provide substantial benefits in terms of increased ridership, especially reverse commuting from areas of high unemployment in the central city to job-rich suburban employment centers. In addition, further reductions in per passenger operating costs are expected along with improved travel time savings and positive impacts on commercial and retail development.

Other Corridor Possibilities for Future Growth

Development and growth within the region has shown other corridors to be prime candidates for future transit service. In 1989, the Atlanta Regional Commission (ARC) completed a study of potential new transit corridors to serve the growing metropolitan Atlanta suburban market. One of the corridors recommended for further study was the I-285 corridor from the current East Rail Line extending northward, parallel to the freeway, to the North Rail Line in the Perimeter Center area. This cross regional line would serve well in attracting new riders from central, south and east DeKalb to areas like Northlake and Perimeter, and would also feed existing radial lines to downtown, Lenox and the airport.

The design features, patronage and cost results of the ARC study are now being subjected to a more detailed analysis by the MARTA staff. The ARC study also recommended that other corridors including some which are currently outside the MARTA service area be considered for their rail transit potential. They are the Perimeter Center to Cumberland Mall Corridor, the Marietta to Arts Center Corridor in downtown Atlanta, and the I-85 Corridor northeast of Atlanta. Refinements to these corridor studies are being coordinated between ARC and MARTA.

Commuter Rail Service Possibilities

One possible future use of MARTA is as the central distributor in the urbanized area for an Atlanta regional commuter rail system. MARTA's rail transit network in Atlanta and Atlanta's unique geographical and historical position in the region make such a merger of rail services particularly appealing.

Atlanta is the transportation hub of the southeast. Eleven rail lines radiate from the central city into the suburbs (See Attachment #3). Preliminary studies indicate that two transfer terminals (probably near Five Points Station and Lindbergh Station) would be necessary to join the rapid rail system to the commuter rail system. For commuter rail, MARTA would thus become the distributor. Each service would enhance the other with the whole becoming greater that the parts.

There is some feeling that further widening of the Atlanta freeway system is impractical. Commuter rail doing what it does best - that is, moving lots of people during rush hour - will possibly save our freeway system from early obsolescence. More importantly, commuter rail would help guide future growth, mitigate the problems of urban sprawl and provide a great opportunity to tie 34 counties and a population of 3 - 4 million into a regional whole.

Indications are that a new-start commuter rail service with the right mix of modern equipment, simplified fare structure and the MARTA distributor would be a cost effective approach to regional transportation. The tracks are already there and it makes sense to use them.

As Metropolitan Atlanta grows, we need to reach out into the extremities of the region using existing rail corridors, trackage and rights-of-way and tie those areas into MARTA as a regional transit system.

Increased Costs of the ADA

Congress has passed and the President signed the Americans with Disabilities Act, a landmark civil rights act for our disabled citizens. Although we applaud the equity expressed within this legislation, as a representative of a public transit agency, we must ask: Where are the funds to implement this legislation? Its requirements are tied to the provision of service and without additional government support the cost of this service may add a restraining burden on public transit systems such as MARTA. We feel our responsibilities to this special group of patrons keenly, but the regulations that will be forthcoming on the service levels mandated in the ADA may require greater financial resources at a time when most transit systems have increasingly fewer resources.

Increased Cost of the Clean Air Act

A similar situation exists for transit in regards to the Clean Air Act which is presently before a Congressional Conference Committee. As earlier stated, transit is beneficial to the environment and MARTA supports the efforts of government to insure clean air for citizens in nonattainment areas such as the Atlanta region. However, it is critical that efforts to regulate the emission standards in our urban bus fleets not be counter productive.

When emission standards and alternative fuel definitions are mandated, the costs of such mandates must be carefully weighed. Mandates that result in increased costs to transit systems will drive up fares or require reductions in service that will make mass transit less attractive. This will increase the numbers of vehicles on the road and aggravate the ozone problem in the Metropolitan Atlanta area. Of the harmful pollutants being emitted in the Atlanta area, 63% of the nitrogen oxides and 70% of the man-made organics come from vehicles. Traffic congestion adds to the problem because emissions from an idling vehicle are worse than from a moving vehicle.

MARTA encourages the House in the setting of emission standards and not in mandating a technology-specific approach to such standards. Specifically, the definition of clean fuel should allow for the use of clean diesel buses and an equitable phase-in schedule should be assessed to minimize the costs to urban transit providers.

Concerns with Reauthorization

The final concern to be brought to this committee is one that deals with the Reauthorization Act. A level playing field was established through the Surface Transportation Assistance Act of 1982 (STAA) which established the federal government's role in the area of public transit. The STAA did two things to establish a level playing field:

1. provided that 1 cent of the federal motor fuel tax be dedicated to transit and thereby ended the vastly unequal competition for funds between transit and the highway interests; and

2. established that Section 3 discretionary funds be apportioned on the 40-40-10-10 percentage basis. Forty percent going to meet the needs of the eight older cities for rail modernization, 40% to the 12 - 15 new start cities for capital construction, 10% to the bus systems for major bus improvements, and 10% for discretionary allocation to the other three categories.

This level playing field has worked well for MARTA and the Atlanta region's transit needs. While some minor adjustments in the reauthorization may prove necessary, major changes should be made sparingly.

As the reauthorization process proceeds, MARTA would be grateful to the Committee if it would accept additional written material pertaining to the effect of the Reauthorization Bill on transit in the Atlanta region.

CLOSING

MARTA with its buses and rail system is a vital resource to the economic and physical well-being of the Atlanta region. Rapid transit is an important element of the area's transportation infrastructure.

I want to thank you for giving me the opportunity to present my views on rapid transit and commuter rail to this distinguished committee and in closing I want to thank you for all that you have done for MARTA over the years. In no small measure it is as a result of your continuing efforts on our behalf that Atlanta has become a city whose transit infrastructure is capable of moving 150 million passengers annually and handling the transit demands of a major national political party convention, a superbowl, and, possibly, an international Olympic games. I thank you.

Possible Commuter Rail Corridors

Testimony to the
House Committee on Public Works and Transportation

By Harry West

Executive Director of the Atlanta Regional Commission

August 6, 1990

I would like to thank Congressman Ben Jones for this opportunity to brief the House Committee on Public Works and Transportation about the Atlanta Region's future infrastructure challenges.

The Atlanta Region's population current population of 2.4 million grew by one third in the 1980s and is expected to add another 60 percent to reach 3.7 million by the year 2010. Similarly, the Region added 50 percent more jobs during the last decade and is expected to gain yet another 60 percent to total more than 2.3 million jobs in 2010.

More people will drink more water, drive more cars, and throw away more garbage. Simply speaking, we have our work cut out for us as we strive to provide sufficient services for this growing population.

The growth projections that I have mentioned assume that at least one major challenge confronting the Region today will be resolved. That is...the issue of an adequate current and future water supply. Without water, you can reduce expected growth in the Atlanta Region by about 80 percent after 1995.

In other words, without an adequate water supply, the eight regional counties may lose more than 800,000 people and 500,000 jobs compared with the growth forecast between 1995 and 2010.

Yes, water is the most critical issue facing this Region. And yes, we need your help and support. Without Congressional authorization - reallocation of Lake Lanier - the recommended alternative for this Region's future water supply, cannot be achieved. Without a future water supply, the Atlanta Region, and to some degree the State of Georgia, is in serious economic jeopardy.

The Region also faces tremendously expensive wastewater treatment challenges. The Atlanta area forms the headwaters of several streams, but contains few major streams. There are just not many streams with sufficient flow to adequately assimilate treated wastewater. As the cost of land rises, so does the expense of potential land treatment alternatives.

ARC is currently conducting a Wastewater Treatment Study for several of our local governments to identify alternatives to meet some of their wastewater treatment challenges. The challenge of meeting all of the Region's wastewater treatment needs - including new and upgraded treatment plants to meet increasingly stricter discharge standards; control of stormwater runoff pollution and the cleaning up of combined-sewer overflows - is one that we need your help on. As a start, your support of these efforts as outlined in the Water Resources Bill would be greatly appreciated.

At the same time, the Region's leaders are working to clean up the Chattahoochee River through regional phosphate bans and stricter new state water quality laws. All told, ARC estimates that local governments will be required to spend more than one billion dollars over the next 20 years to address wastewater treatment challenges.

Through our regional transportation planning efforts over the past 20 years, we have successfully expanded and reconstructed our freeway system and are now operating over 30 miles of heavy rail transit and an extensive bus network. Yet several challenges remain. We must meet the growing need for adequate suburb-to suburb transportation facilities and services while at the same time easing the congestion in our Region's suburban activity centers. We must continue our efforts to implement the long-recognized need for some form of transit in all of the Region's eight counties.

There is a clear need for the Federal government to play a strong role in the transportation improvement process in order to assure the nation's continued economic vitality.

A final transportation issue of great concern to the Atlanta Region is the need to maintain an adequate and safe air transportation system. ARC is currently conducting a study to determine an appropriate site of a second major air carrier airport for the Atlanta Region. This facility would serve to relieve Hartsfield Atlanta International Airport of some of its origin and destination traffic - helping to maintain its efficiency and dominance as a major, international hub in the nation's air traffic system.

Many other challenges face our Region such as solid waste disposal and adequate housing. Recognizing the limited time I have to address the Committee today, I will not go into detail about our work in these areas, but I assure you we are involved in efforts to address these needs.

In closing, I would like to stress that the most critical issue facing this Region, and our top priority, is the need to secure a reliable, long-term water supply for this Region. The people of the Atlanta Region and of Georgia are counting on you to help. Please don't let us down.

Thank you very much for this opportunity. We look forward to your support.

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

THURSDAY, AUGUST 30, 1990

House of Representatives,
Committee on Public Works and Transportation,
Tulsa, OK.

The committee met, pursuant to call, at 4:45 p.m., in the Francis F. Campbell City Council Room, Tulsa, Oklahoma, Hon. Glenn M. Anderson (chairman of the committee) presiding.

Present: Representatives Anderson, Laughlin, Hammerschmidt, Inhofe and Hancock.

The Chairman. The meeting of the committee will come to order.

Good afternoon. The Committee on Public Works and Transportation Hearing on the Future of our Nation's Infrastructure Needs will come to order. I want to welcome you here today and to thank you for taking time from your busy schedules to share your thoughts with us about this important issue.

Earlier this year, our Committee initiated a series of events designed to give us a better understanding of our Nation's infrastructure crisis. At our first event in Washington, we looked at the infrastructure needs from a national point of view. Our second and third events focused on the impact of infrastructure on our ability to compete in international markets. And future hearings will examine infrastructure financing alternatives and new technologies.

It is important, however, for us to get a good look at the infrastructure problems encountered at the local level. Our meeting here today in Tulsa is another in a series at various sites around the Nation to review infrastructure needs with the people most directly involved and to hear a broad range of ideas to help resolve the problems.

It is a great pleasure to join Jim Inhofe for this hearing, and I want to thank him and the people of the 1st District for their gracious hospitality. Congressman Inhofe is a valued member of the Public Works Committee. As one of the few licensed pilots on the Aviation Subcommittee, Jim is regarded as one of the resident aviation experts of the Subcommittee, as well as on the full Committee level. Because of his thorough understanding of aviation and, in particular, the needs of the general aviation community, the Committee has been better able to respond to issues affecting the general aviator in such areas as VFR corridors, mode C and auxiliary flight service stations. In addition to his act of participation in general aviation issues, Jim has also been active on such topics as foreign repair stations, joint use and taking the aviation trust fund off the budget. In fact, it was Jim's investigation into foreign repair stations that helped stop the further expansion of their use for United States registered aircraft.

However, Jim has not limited his activities on the Committee to just aviation issues. As a member of the Water Resources Subcommittee, Jim inserted report language in the Oil Spill Bill which brought attention to an incident that happened here in Tulsa involving hazardous materials in an oil pipeline system. And Jim's language instructed the Secretary of Transportation to study the issue and recommend any legislative changes which would strengthen our pipeline laws, thereby protecting the environment and our refinery workers, as well as our pipeline system. As the result of his efforts, the Secretary has informed the Committee that no further legislation is needed at this point. However, he did acknowledge that a greater emphasis on enforcement of the current statute is needed and has pledged to do so.

I would also like to welcome Congressman John Paul Hammerschmidt, the Committee's ranking Republican member, as well as my good friend and one of the rural leaders in the Congress on the infrastructure issue.

Also joining us is Congressman Greg Laughlin, a fellow Democrat and representative of the 14th District of Texas, where we also had an infrastructure hearing. In less than two years as a member, Greg has left his mark on Washington and in Texas and throughout the country. He has been a tremendous asset to the Congress and to our Committee, and we should all be pleased that he is here with us today.

And also with us is Congressman Mel Hancock, who is here from Missouri and brings us to a very thorough working knowledge of the political process and a special interest in public works issues. Tomorrow morning, we will be in Mel's district for a similar hearing.

I appreciate everyone's presence here this morning. As we all know, when we talk about infrastructure, we are talking about the very cornerstone of our cities and rural communities. It may not be an exciting subject, but it is infrastructure that provides the foundation for a sound economy and is the very heart of the standard of living and quality of life that Americans enjoy.

From our previous hearings, we know that not only do many pipeline problems exist with our public works facilities, but we have been shortchanging our public works investments for more than 20 years. The question we ask today is, what about Oklahoma's infrastructure? How adequate is its network of public facilities—roads, bridges, public buildings, sewers, waste water treatment facilities, water supply facilities, dams and other public works—to meet current needs? Now, in addressing this issue, we should all keep in mind that economic research in recent years has tied the level of public spending on infrastructure to the productivity rate in the private sector. The United States' productivity growth rate fell from 1.8 percent annually in the 1960's to .07 percent in the early 1980's. And during that same period the annual growth rate of investment in infrastructure fell from four and one-half percent to less than half to .8 percent.

Productivity in our country is growing much more slowly than in other developed countries, such as Japan, West Germany, Canada, France, Italy and the United Kingdom, some of which, incidentally, invest almost two to five times as much in their public works as does the United States.

And today we look to you to help us gain further insight into your infrastructure needs and to continue our debate on how to deal with the current and anticipated needs of our public works. I now would like to recognize other members for any opening remarks they may wish to make. And let me first recognize Congressman John Paul Hammerschmidt, and then Congressman Laughlin, and then Congressman Hancock, in that order, concluding with our host, Congressman Inhofe. So, John Paul, you are first.

Mr. **Hammerschmidt**. Thank you very much, Mr. Chairman. Of course, it is indeed a pleasure to be here in Tulsa for this important hearing, and I join you in thanking Jim Inhofe and the citizens of the 1st District for their warm hospitality that they have afforded us. I would also like to acknowledge the presence of and welcome our colleagues Mel Hancock from the 7th District of Missouri and Greg Laughlin from the 14th District of Texas, whose participation in this hearing is greatly appreciated.

You know, the people of Tulsa and the 1st District are certainly fortunate in having Jim representing their interests in Congress. As you noted, Mr. Chairman, Jim's expertise in aviation matters, particularly those issues involving the general aviation community, has been invaluable to the Committee.

And recently, Jim's leadership was instrumental in bringing to the attention of the U.S. Department of Transportation a serious discrepancy between drug testing rules imposed upon employees at domestic repair stations and those imposed at foreign repair stations. Jim's persistence resulted in a commitment from Secretary Skinner to include the implementation of drug testing or equivalent measures at foreign stations as a primary consideration in the awarding of station certification. Thus, standards similar to those imposed upon repair station workers here in Tulsa and across the country will also have to be met abroad.

Jim's leadership and concern for his constituents have been evident in other ways as well. As you noted, Mr. Chairman, Jim has been active in the areas of pipeline safety and water resources. And Jim's diligence led to the inclusion of a $300,000 study in the Energy and Water Appropriations Bill for the rehabilitation needs of Tulsa's vital aging levee system. We were out there looking at that this afternoon, Jim. In my district in Arkansas, I have experienced first hand the devastation that flooding can bring upon both the public and the local economy. So, I am all too aware of the importance of flood control, and I can certainly appreciate your diligent and hard fought efforts over those levees, Jim.

As a ranking member of the full Committee, it has been a pleasure to work with Jim. I look forward to continuing to work with him on a variety of major issues, including the challenges of meeting this country's infrastructure needs.

Today, we will be hearing from the mayor of Tulsa and other local and agency officials about the infrastructure needs of the Tulsa area and how those needs might best be met. Hopefully, what we learn from these and other hearings will guide us as we attempt to formulate effective and fiscally responsible infrastructure policies for the future and for this nation.

Mr. Chairman, I join you in welcoming the witnesses who have taken the time from their busy schedule to appear before us today. I look forward to hearing their perspectives on how to meet the challenge of rebuilding our nation's infrastructure.

Thank you very much, Mr. Chairman.

The CHAIRMAN. Thank you, John Paul.

Congressman Greg Laughlin of Texas.

Mr. LAUGHLIN. Thank you, Mr. Chairman. I too want to join the other members of our Committee in saying what a pleasure it is to join our colleague, Congressman Jim Inhofe in his home district. Jim is more than a colleague to me. He is my good friend and neighbor in the office building, and it is a rare day that I am in Washington, DC that I do not see Jim Inhofe because he offices right around the corner from me.

We are on Public Works & Transportation together. And for a year and a half, I wondered why Jim Inhofe was on the Merchant Marine and Fisheries Committee. I come from a large rural district with six counties on the Gulf of Mexico, so with the fishing industry and with the Gulf intercoastal waterway system of 180 miles, it made a great deal of sense for me to be on that committee. But I knew Jim was from Tulsa. And for the life of me, I did not know where Tulsa fit on a major water system—the Gulf of Mexico or Atlantic or Pacific Ocean. And I knew from my geography it was not on the Mississippi River. But after our tour of the port today, I am very acutely aware of why it is necessary for Jim to adequately represent his district. I have been in the port of Houston and the ports in my district, and I was impressed with the facility. And I know that that facility enhances the economic welfare and development of Jim's district because of his membership on that important committee.

And I have valued his advice and experience as we have worked together on the Aviation Committee. And Jim, I remember several times on special orders that you and I have worked on behalf of American Airlines. I knew that it was important in your district, and I have learned from the President of American Airlines, Bob Crandall, how important his facility is in your district. And it has been a pleasure because American Airlines neither stops in my district nor does American Airlines have any employees in my district; although it is headquartered in my state.

So, it is a pleasure being with you here in your home, and I look forward to hearing from the witnesses and thank you very much for being gracious to invite us to learn more about your district and the needs of your state.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you, Greg.

Congressman Mel Hancock from Missouri.

Mr. HANCOCK. Thank you very much, Mr. Chairman. In the interest of time, I want to just mention one item, and that is that my district, the southwestern part of Missouri, is adjacent to this district. And Congressman Hammerschmidt's district is the western part of Arkansas, our three districts make up the tri-state area of

Arkansas, Oklahoma and Missouri. I have felt for quite some time that that area is kind of an economic entity. And I am extremely well pleased that this hearing is being conducted.

As you mentioned, Mr. Chairman, we go to southwest Missouri tomorrow. A week from Saturday, you are holding a full Committee hearing in Springdale, Arkansas, which is John Paul Hammerschmidt's district. And under those circumstances, I think that you, Mr. Chairman, will be able to take a real good view of this tri-state area back to Washington.

This is the bread basket of the world—this area down through here. And I know that there are problems that exist on the east and west coast, but we want to make sure that those people get fed properly. And you know, they need our beef and they need a lot of other things from this area.

So, it is a pleasure for me to be here and support Jim. Jim—you know, actually—I am going to say this. I had some people agree to quit introducing me as the oldest freshman congressman. But, I will make that statement. I am the oldest freshman congressman, and Jim has been very helpful in orienting me in Washington to kind of the ways of Washington. I am still in a learning mode.

Thank you very much. Thanks for having me down, Jim. Thank you, Mr. Chairman, for holding this hearing.

The CHAIRMAN. Thank you, Mel.

And now your Congressman, Congressman Jim Inhofe.

Mr. INHOFE. Thank you, Mr. Chairman, first of all, and everyone else. I am probably the most appreciative person here because I believe—we have checked and found that the Public Works and Transportation Committee has never had a committee meeting—a hearing in Tulsa, Oklahoma. And so, quite often, when we—issues come up in Congress and we talk about problems that we have and we talk about the navigation way, Congressman Laughlin. Until you have been here and you see it, you do not really have a perspective. You do not really understand it. And I think now that we have the leadership of the Public Works and Transportation Committee here and our Chairman, Chairman Anderson, being so kind as to hold this hearing here, it is probably more meaningful to me than anything that has happened since I have been in Congress.

It is appropriate we have it here in this room. This is the room, Mayor Randle, where I was Mayor for three terms. And while I sat in the chair that the Chairman is in right now, that—it brings back old memories. And I think that it also reminds us, when I see Bill Moyer out here—Bill Moyer, Mr. Chairman, is the Executive Director of the Oklahoma Municipal League, which I believe you have some 370 member cities, is that not right, Bill?

Mr. MOYER. [Nodding head affirmatively.]

Mr. INHOFE. Now, it has been kind of a misconception in Congress for a number of years that the problems—the infrastructure problems are confined to the highly industrialized older areas. And that was true up until a couple of decades ago. When I became mayor of Tulsa, we found out that we had not been addressing our infrastructure needs for quite some time. And back in the late 70's, we had a city that was somewhat rotting out from under us. And so, this was happening not just here in Tulsa, Oklahoma, but throughout the frontier states throughout America. And I think now that many of the older industrial states and cities are now in better shape than we are out here. And I think we are going to hear from people such as Neil McCaleb or Travis Freeman, who will be addressing some of the problems that we have that would have been very unusual to talk about some 20 years ago.

Today, we had a chance to go out and see the—as Congressman Hammerschmidt mentioned—our decaying system of levees. The levee system was put in 1945, Mr. Chairman, 20 miles of levees. And it is deteriorating to the point where it is a major infrastructural need in the United States. Out at the—when we took our tour of the airport, we were able to see a lot of the needs of the airport; but it was something that was not visible. That is a problem that we have that is somewhat unique, and that is, in the formula that is used in the AIP, they use revenue-producing passengers, as opposed to total passengers. This is something we would like to address and I have talked about it in the Committee in the past.

I think it is really interesting when you stop and realize that we have Congressman Laughlin. He is all the way up here from—I would say he is from Victoria, Texas, because I cannot remember the little town that he is from.

Mr. LAUGHLIN. West Columbia.

Mr. INHOFE. West Columbia, Texas. I do not think many of you have spent a lot of time there. But it is—he has, I believe, six counties that are on the intercoastal waterway. And so, you can actually—as we were going there—as we are out there at the port today, looking down, and you can see—going down there, you can go all the way to his district and just float right through John Paul Hammerschmidt's district. And so, it is something, as I say, unless you can visually see it, you cannot really appreciate it.

So, Mr. Chairman, I will go ahead and submit my—if there is no objection—submit my written testimony to this Committee and comments and look forward to hearing from those individuals who will impress upon this Committee the needs that we have in this part of Oklahoma.

The CHAIRMAN. No objection, so ordered. Thank you very much.

And before I go on with my schedule here, I would like to correct one little impression that was given out, that you guys are all from this area and you are all close together and I am from way out on the east coast or west coast. And I just wanted to let you know that when I was in World War II in the Army, I was stationed at Camp Greuber, Oklahoma, in the 42nd Division and I walked on my hands and knees as an infantryman all through the crooks and hills. I bet there probably is nobody else in the audience that has crawled in as much of Oklahoma as I have. And of course, if you come to my district, my top guy in my local office was raised in Muskogee. He is my top guy out there, so that is a little Oklahoma influence in my local office. And his parents—his father and his father's father headed the biggest brick company and construction company here. They did the brick work in the Oklahoma University and the Oklahoma State University. So, that is just one guy who works for me. That is what he did for years.

Mr. INHOFE. Mr. Chairman, let me just say, welcome home. [Laughter.]

The CHAIRMAN. I am not exactly an Oklahoman, but I am not too far away. Anyway, it is fun to be with all of you. It is a great part of our country.

Now, our first witness. Because so many people have been willing to participate in this hearing and because of the time constraints, I am going to ask each witness to summarize his statement orally in hopefully two to three minutes. Each witness' full statement will be printed in its entirety in the record of the hearing. So, you will not lose anything. It will be in there.

Now, I want to call our first witness, the Honorable Rodger Randle, Mayor of the City of Tulsa.

[The prepared statement of Congressman Inhofe follows:]

U.S. HOUSE OF REPRESENTATIVES

CONGRESSMAN
JAMES M. INHOFE
1017 LONGWORTH HOB • WASHINGTON, D.C. 20515 • 202/225-2211

Statement of
Congressman James M. Inhofe
Public Works and Transportation Committee
Field Hearing - Tulsa, Oklahoma
August 30, 1990

MR. CHAIRMAN: Thank you for holding this infrastructure field hearing in Tulsa. I know I speak for all Tulsans when I say "Welcome to Oklahoma and especially to Tulsa."

Over the past several months, this committee has documented the critical state of disrepair of our infrastructure. We have learned that neglecting infrastructure endangers public safety, hampers U.S. economic competitiveness, and diminishes the overall quality of life for all Americans. History is replete with examples of Americans striving to make life better and easier for their children. This strong desire to build and leave things better than when we found them is increasingly being built on a crumbling foundation and thus it is incumbent on this committee to develop a comprehensive plan to rebuild our nations infrastructure.

In a few moments, we will hear from several state and local officials who will outline the priority infrastructure needs of both the city of Tulsa, as well as Oklahoma's first Congressional District. However, I would like to highlight a couple of needs which in my opinion require immediate attention.

Tulsa's most pressing infrastructure need is reconstruction of our levee system which was initially constructed in 1945. Tulsa's levee system encompasses 20 miles along the Arkansas River and protects an estimated $1.2 billion of public and private property. Although normal and regular maintenance has been done on the levee, a number of pipes and culverts have deteriorated causing erosion and "sloughing" of the levee slopes - thereby preventing the levee from operating as designed and increasing the risk of failure. In fact, the levee failed in two locations in October of 1986.

With the help of my fellow Oklahoma Congressman Wes Watkins, language was included in the Water Appropriations bill providing for $300,000 for the Corps of Engineers to study what needs to be done. Additionally, the language instructs the Corps to work with state and local officials to develop a cost sharing agreement. This is a positive first step in addressing this pressing need; however, it is just a first step. At some point, this committee will be called upon to authorize finding to reconstruct Tulsa's levee and thus I will be calling upon you, my committee colleagues, to support me in this effort.

Another critical portion of Tulsa's infrastructure which needs attention is our airport. As we learned earlier today, Tulsa International Airport is expected to exceed its current capacity during the later part of this decade. Perhaps the greatest indication of a strong aviation presence is the several national aviation firms represented in Tulsa. In fact, our largest employer is American Airlines.

Unfortunately, under the current AIP formula, airports are compensated for revenue passengers only. In 1989 approximately 1.6 million passengers were enplaned at Tulsa International airport. Of those, 191,000 were "non-revenue" passengers, which means that these passengers were not included in the entitlement formula for Tulsa's AIP funds. By not partially counting these "non-revenue" passengers, Tulsa is losing up to $124,000 per year. It is my hope that at some point the committee will address to what extent "non-revenue" passengers should be counted in determining AIP funds for airports. I am confident that this is not a frustration of Tulsa alone, but one that is shared by any airport which is the base for a large number of airline employees.

Finally, I want to mention what I believe to be an excellent example of a private/public partnership on a public works project. Earlier today we very briefly visited Tulsa's River

Park's System, which is a low-water dam project that was built and is maintained through private/public partnership.

The Parks operations are primarily funded under a joint agreement by Tulsa city and County governments. However, much of the revenue for special operations and capital expense are from private resources. In fact, for every $1.00 in public funds appropriated for the Parks, there is $1.04 in private funds raised. Since the Parks' inception in 1974, over $10 million in the form of cash, labor, land, lease fees and equipment has been donated by private sources for the Parks.

During our continuing deliberations on how to address our massive infrastructure needs with scarce federal dollars, it is my hope that the committee will use Tulsa's River Parks as an example of how private and public funds can successfully work together to address public needs. Budget realities not only require that federal dollars are spent wisely, but greater cooperation between public and private resources as well.

Again, thank you Mr. Chairman for holding this hearing in Tulsa, and I look forward to working with you and the members of the committee to work on our infrastructure needs.

TESTIMONY OF HON. RODGER A. RANDLE, MAYOR, CITY OF TULSA

Mayor RANDLE. Mr. Chairman, I would certainly like to welcome all of the members of the Committee. We have provided a written copy of what I have to say. In order to meet those time requirements, I will condense even further. But I would like to present each of you a copy of the report on the capital needs of this community, as well as pending efforts to raise dollars for that capital. In addition to that, if you will distribute those, we will present each of you with an honorary citizenship certificate as a mark of the honor with which we receive you in this community. This will entitle you through the use of the certificate to pay a local sales tax while you are in Tulsa. And we would encourage you to buy something while you are here so that you will be able to do that and contribute toward the cost of the streets and things you are using.

Infrastructure needs in this community, as in other cities, are a constant challenge. We have infrastructure goals and programs and priorities; but finding the funding to meet those requirements is something that is constantly an effort for top leaders and citizens in the community. We have spent about one point—rather, we have $1.6 billion in identified capital needs in this community pending. We have a current sales tax of one penny dedicated exclusively to capital, which we will be voting on this winter. It will help provide over the next five years a little more than $200 million of additional capital money to meet those requirements.

We have very specific goals on infrastructure management. First is to keep the costs of operation and maintenance at the system so that we can keep those costs of operation and maintenance at an adequate level so that we can at least keep the system at its current level. Delayed maintenance means accelerated deterioration and more costs down the line.

The second goal is to simply protect the health and safety and welfare of our citizens. An example of what falls into that category is the $160 million needed for flood control projects to help protect this community from further loss of life and property due to uncontrolled flood conditions.

An additional goal is to replace obsolete facilities and expand overloaded facilities. We need 86 miles of streets widening. We have a 60 year old main water treatment plant that needs to be replaced. And we certainly need to pay the cost of complying with federal and state mandates. Over the next four years, we think we need to spend approximately $95 million on waste water and $15 million on upgrading water plants.

We commit a major share of our resources in Tulsa to these infrastructure requirements. Since 1977, we have allocated more than a billion dollars for the construction of capital projects—$400 million through capital sales tax funds, $475 million in revenue bonds have been paid for by the users of the services, and $160 million in general obligation bonds being paid for by property taxpayers. In addition, every citizen—every household in Tulsa pays $2 a month for flood prevention to the Stormwater Management Program. Over the last ten years, every service rate has risen as we have had to maintain the cost of the revenue bonds.

So, I give you those numbers, which may seem small by federal standards, but as an example of what one community does to cope with meeting infrastructure requirements. The materials that you have been presented allow you to look in more detail at what goes into those costs.

We have very great problems and constraints on meeting these requirements. The Federal Government increasingly gives us environmental mandates, while at the same time, it has eliminated some traditional sources of revenues to pay the cost of meeting those. We have eliminated sales tax exemptions on federal tax returns. We used to be able to make a few dollars in the old days under arbitrage. You have correctly eliminated those arbitrage opportunities, which never should have been allowed. But cities made money on those arbitrage. And laws are being considered to eliminate tax exemptions on interest earned on local debts.

We cope with federal regulations, which are often inflexible. We have federal mandates, which much supersede locally set priorities. The federal tax system makes us a donor state in some programs. I could go into those in this presentation, but to save time, we will refer you to the written materials given to you.

In connection with these restraints, we would urge you to support H.R. 5423. This bill would give—would provide relief for tax exemption—exempt bond users from the burdens and complexities imposed by the Tax Reform Act of 1986.

As I look over our situation as we cope with infrastructure requirements and how to fund them, most mayors would ask you to send more money. I think we could get along with less money if we had less federal dictates of how we spent local money. And as I look back over history, I am not sure but what we were not better off in the days when we got no federal money, but also no federal direction on what we would do with the money that we do have. And so, as long as the federal government is going to be such a strong director of how we set local priorities and spend local budgets, we would ask you that you send with those directives the money to carry out those orders. But, we would also, for the record, happily trade all of those federal dollars for an elimination of federal dictates in how we run the local government in America. Thank you.

[The prepared statement of Mayor Randle appears on p. 1398.]

The **Chairman**. Mr. Mayor, in terms of priority, what are your key infrastructure needs, and how can the Federal Government best help meet them?

Mayor **Randle**. Well, I wanted to add a clarification to those philosophic comments that I just made to say that I think under any circumstances, we would like all of the highway money we could. And so, streets and highways are a constant top priority. Everyone sees the condition of streets and highways; everyone drives on them. The importance of moving goods and people is essential for economic vitality.

But at least equal to that would have to be the water and waste water and sewer requirements. No one sees those needs. The deterioration is not observed. The replacement of old systems makes no increase in the quality of services being delivered. You spend huge sums of money just to stay even. But we are now entering kind of middle age in Tulsa. And so, we are, for the first time in our life, starting to cope with citizens—with systems that for the first time are wearing out. And so, we are becoming much more sensitive to the costs and burdens of those environmental requirements for quality water, quality disposal of waste water and so forth. So, I would certainly rate both of those at the top of where we need money needs.

And environmental goals are not just a Tulsa desire. They are a national imperative. And in the environmental area, many of the federally set environmental standards are properly set for national achievement. But if they are going to be set for national achievement and it is a national objective, I think it is proper that there be national dollars put behind the efforts required of local governments to help us meet locally those nationally set objectives.

The CHAIRMAN. John Paul.

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman. Mayor Randle, we thank you very much for your testimony, even though you had to summarize it. But, I have been thumbing through—I was listening—but I have been thumbing through these two brochures, "The Capital Program" and "The Capital Plan Summary", and they are so well done and have so much information.

Mayor RANDLE. We are a community that needs—that understands the importance of planning to get to our destinations.

Mr. HAMMERSCHMIDT. Well, they are excellent. And I am not going to take time to ask any questions because I know that the answers to them are probably in these summaries. But, I congratulate you on this very good documentation of your needs and of your projection on future needs.

Mayor RANDLE. Thank you.

Mr. HAMMERSCHMIDT. Thank you.

Thank you, Mr. Chairman.

The CHAIRMAN. Greg, do you have anything?

Mr. LAUGHLIN. Yes, sir.

Mayor Randle, I want to commend you for your testimony and the presentation you made because you hit on a topic that few people outside of the Committee that we serve on and people in the government position you are in pay any attention to, and that is the value of our infrastructure assets. And I noticed in your report and also you testified that here locally, Tulsa has a $4 billion asset which, if we delay the maintenance, it will continue to deteriorate at a much more rapid rate and the replacement costs or the repair cost will skyrocket.

And I would challenge the media here today to give better attention because so few in the public appreciate the value of the infrastructure that they take for granted every day. And I would challenge the media to give some attention, along with the murder rates and the drug raids that—hopefully you have fewer than we have in other parts of the country. But, these are needs that we cannot afford to let deteriorate. And I—in addition to my challenge to the media to give some attention to the needs for maintenance; do you have any other suggestions on how we, as a group, can get the public's attention focused on the infrastructure maintenance needs of our country?

Mayor RANDLE. I think you are helping with that by public hearings like this that help bring media attention to the question and efforts that you all carry out. There is not any choice about whether we will spend the money. With maintenance, it is always a question of whether we will spend it now, and modestly, or spend it in larger sums at a later time. It is very difficult for people to put a priority on spending things that do not provide an increase in enjoyment as a result of the expenditure of those dollars. And most maintenance does not give that return. When we build a new intersection or we build a new highway, everybody sees it, everybody enjoys it and everybody thinks, is this not wonderful what we have spent our money on. When you build a water line replacement, nobody sees it. It creates an interruption for everyone's convenience while it is under construction and when it is over, everything just goes back to the way it used to be, except that the city treasury has less money in it. And so, understanding of the value of doing those things today is hard to convey.

And then, I should not have to observe to you all, since we are all elected officials, there is a great temptation by those who are in elected office to spend money where there is the most immediate enjoyment by the citizens to the expenditure of the money, and maintenance rarely falls in that category.

Mr. LAUGHLIN. Thank you very much.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you.

Congressman Mel Hancock.

Mr. HANCOCK. I would just like to say, Mayor, that I—what was your background before you became mayor?

Mayor RANDLE. I practiced some law and I served in the Oklahoma state legislature dealing in state government for many years.

Mr. HANCOCK. You are somewhat of a rare species to speak in this hearing. When you said, we think that if the Federal Government would quit mandating, we could get by on less money. I do not know, but I think that is the first time that I have heard a mayor anyplace say, well, we think we could get by on less money. And I agree with you. In fact, that is one of the things that is really near and dear to my heart.

You may be familiar with a situation in Missouri with a little constitutional amendment that was passed in 1980 which prohibits the state government from passing a law mandating any program at the local level without providing the money. And in fact, they call that amendment the Hancock Amendment, even though I was not in the state legislature. Even though some of the state legislators do not like it, they also will say, boy, we wish we had it on the Federal Constitution that the Federal Government could not mandate these programs that maybe they need in Alaska, but they do not need in Tulsa, Oklahoma. And frankly, this is the thing that really—it really pleases me to have somebody in your position hit what I think is the very key of removing the waste, fraud and mismanagement at the federal level. And that is a lot of these mandated programs that cause you to throw money away because some bureaucrat in Washington thinks this is the way something ought to be done. And I appreciate your comments. Thank you.

Mayor RANDLE. Missouri is very fortunate to have the Hancock Amendment because that is something we can very much use here in Oklahoma as well.

Mr. HANCOCK. Well, I will make some suggestions on how to do it later on.

The CHAIRMAN. Thank you, Mel.

Congressman Jim Inhofe.

Mr. INHOFE. Mr. Chairman, I, too, appreciate Rodger's comments, and I probably am more sensitive to them since I have done what he is doing now. And I can remember several times—and I think Mr. Kepso would agree with this—it probably had not been done before; but, we actually did turn down a couple of—one was a water grant, I remember when we were first in office—trying to impress upon the administration that when grants come in, if the guidelines are so tight that they are making the decisions and they are micro managing our cities from Washington, we do not—that is not the way it should happen. The closer you are to the local level, the more you need—you understand the real needs of government, of the city and of the people. And I learned from having served in the state legislature as mayor of a city and now in Congress, that when you—the closer you are to the people, the more careful you have to be because you do not get by with anything when you are right here. I think that is where the decisions, the priorities, should be made.

We are very fortunate, Mayor Randle, in that our Chairman, Chairman Anderson, also had the position that we had. He was the mayor of a major city for a number of years. I think those of us in Congress who came from these ranks understand that the guidelines coming down are guidelines—maybe in major categories, but certainly not micro managing our cities. And it is not just in infrastructural needs, not just in capital needs, but in law enforcement funding and other areas. In fact, we are trying right now to go directly to some of the major cities, as opposed to going through the governors' offices and through the state government. Since you have served both places, I think you probably join me in that concern.

Mayor RANDLE. Every layer of bureaucracy extracts an extra cost.

Mr. INHOFE. That is right.

Mayor RANDLE. Where the relationships could be done directly with municipalities, then that will work better than having a third party intercede.

Mr. INHOFE. Yes. And Mayor Randle, one reason that we deviated from the script on this hearing and we took half of our hearing in a bus going around and looking at what we have done in Tulsa and what our needs are in Tulsa, was to see them first hand. When I look out and I see people like Travis Freeman, Jody Parker and others, those are people who have made great contributions to our cities. We look at the River Park system and the amount—the percentage of private funding that has gone in there.

I think that—I hope that when this Committee goes back, they will remember Tulsa, Oklahoma, as a city that takes care of its own needs and is more deserving from that perspective of the attention from the Federal Government.

Mayor **Randle**. That's an excellent point.

Mr. **Inhofe**. Thank you, Mr. Chairman.

The **Chairman**. Thank you.

Mr. Mayor, just one point to note. On page five of your statement, you urge support for Congressman Anthony's bill. Not only do I support it, but last Congress I introduced a bill, which our Committee reported, that addressed the same issue of tax treatment of infrastructure projects as the Anthony bill. I just wanted you to know that we thank you for your testimony. I want to let you know we support what you asked for.

Mayor **Randle**. I am pleased to hear that. Thank you.

The **Chairman**. And our next witness is Donna Peters, representing INCOG. That is the Indian Nations Council of Governments. And, Ms. Peters, the floor is yours.

TESTIMONY OF DONNA PETERS, SENIOR PLANNER, INDIAN NATIONS COUNCIL OF GOVERNMENTS

Ms. **Peters**. Thank you for providing us with the opportunity to testify. I represent INCOG, a regional planning agency serving five counties and 44 local governments in the Tulsa metropolitan area. Our mission is to provide planning and management services to member governments and their constituent organizations.

You have heard from Mayor Randle about the City of Tulsa's capital improvement needs and received written testimony from other area mayors. Our comments will focus on counties. And though we will principally discuss Tulsa County, much of our testimony will apply to surrounding counties as well.

You have been provided with written comments, and in the interest of time, I will skip over much of my oral report and refer you back to those comments.

At present, Tulsa County is designated as a non-attainment area for the pollutant ozone. Through concerted state and local efforts, significant improvement to our air quality has been attained. In fact, Tulsa County has been in compliance with air quality standards for the past three consecutive years and is in the process of being redesignated as an attainment area. This is vitally important to the city, county and region for future economic development. Further comments related to the air quality issue will be made later in my remarks.

Unlike cities whose primary sources of revenues are sales tax or utility fees, Oklahoma counties must rely on property taxes for revenue. The primary financing mechanism for counties is a millage levy. Like most, if not all counties in Oklahoma, Tulsa County is currently at the maximum millage limit as established by the Oklahoma Constitution.

The millage from property taxes is used almost exclusively for operations, which is essential to sustain a minimal level of county administration. As a result, Tulsa County has virtually no source of funding for capital improvements.

Nonetheless, recognizing the value of prudent capital programming, the Tulsa County Board of Commissioners approved the concept of a capital improvement, or CIP, plan for Tulsa County in the late fall of 1988 and established an inventory of needs which totaled $88 million. A detailed list of those needs are in the written comments.

The Board of County Commissioners deferred action on the majority of these CIP recommendations until a source of funding could be identified. Tulsa County has not received any significant funding for capital projects in ten years.

Historically, the major sources of revenue for capital improvement is general revenue sharing. At present, the only federal monies available come from two sources, CDBG funds and gasoline tax funds. CDBG funds are made available through the state. Tulsa and other area counties have participated in this program to further economic development through improved infrastructure, on loans to businesses and by assisting rural water and sewer districts in meeting serious infrastructure needs. Federal transportation programs funded with the gasoline tax have provided some assistance to counties for highways and bridge improvements.

Issuing general obligation funds is the classic method available to counties to finance capital improvement projects in Oklahoma. However, G.O. bonds issued by county government must be approved by 60 percent of the voters because of constitutional restrictions. Cities, by contrast, are only required to obtain a simple majority of voter approval for public utility projects, including streets and bridges.

For example, the most pressing need for the county is a new jail and related juvenile justice facility. The present county jail is at the maximum capacity, based on state jail standards and a federal court order. Tulsa County has attempted without success to use G.O. bonds to finance needed jail improvements in recent years. In 1987, a jail bond issue garnered 57 percent of the voter approval; in 1989, a similar issue was defeated by the voters.

In summary, I would like to say that new funding sources must be identified for future capital improvements. Improvements to public facilities and expansion of services will most likely have to be paid for by the same public that benefits from them. Continued deterioration of existing infrastructure, along with increasing demands for new facilities and additional services will not go away just because the public does not want to pay. Local governments look to the Federal Government in addressing these needs.

For your consideration, we respectfully offer the following observations and recommendations:

INCOG has closely followed the proposed Clean Air legislation, and we support efforts to enact a new clean air bill. We encourage the Conference Committee to resolve remaining differences in a timely fashion. Of particular concern to us in these deliberations is how transitional areas, such as Tulsa County, will be treated. It is our understanding, based on EPA analysis that the House language would leave us in a transitional status until 1992. We understand that the Senate language on transitional areas may be more favorable to areas such as Tulsa and we would encourage adoption of the Senate language. Achieving redesignation at the earliest possible date, rather than waiting until 1992, is of critical importance to economic development efforts in our region.

We also believe that it is important the conformity determination in the Clean Air bill involving transportation be done on an overall program or plan basis, rather than on a project-by-project basis. As a result, we strongly support the House language, which we believe addresses this issue. Further, we urge that plan or project approvals involving transportation projects should be accomplished through a collaborative process involving both the Department of Transportation and Environmental Protection Agency.

We would also encourage retention of flexibility in the use of CDBG monies, without together targeting requirements as proposed by the Administration. Retaining existing flexibility in the CDBG program is necessary to meet the most crucial community development needs and clearly focuses resources on meeting needs of low and moderate income persons.

In deliberations regarding future surface transportation legislation, we urge that consideration be given to addressing problems of mobility, not just between suburbs and inner city, but to meet the future transportation needs involving suburban cities and outlying activity centers.

Continuing funding for area-wide water and air quality programs is also important to us. We would urge Congressional consideration for pass-through provisions for Section 604(b) funding for water quality planning programs similar to that provided in Section 205(j) of the Clean Water Act. I understand that your Committee will be considering this issue and we would be happy to offer more specific information and recommendations at a later date.

Finally, we encourage the Federal Government to look seriously at supporting regional planning efforts and promoting cooperation among local governments. The issue of solid waste and drug enforcement planning and program implementation comes to mind in this area.

I appreciate your interest in hearing about the issues and concerns of the Tulsa area. We would be happy to provide any additional information that you might need.

[The prepared statement of Ms. Peters appears on p. 1381.]

The **Chairman**. John Paul.

Mr. **Hammerschmidt**. Thank you, Mr. Chairman.

Ms. Peters, we appreciate very much your very comprehensive statement. Let me just focus on one little bit of it. I noticed on page 7, you say, "We also believe it is important that the conforming determination in the Clean Air Bill involving transportation be done on an overall program or plan basis, rather than on a project-by-project basis." This Committee is very, very concerned about that issue. Most of the clean air legislation comes out of a different committee. It comes out of the Energy & Commerce Committee. However, because of this dramatic effect this could have had on transportation needs, we talked within our own ranks in the House—and we do have, as you know, this provision, which you are asking us to support.

The only point I would make is, we are going to conference with the Senate. So, we would encourage that any influence you have on the other body—and I am not saying that your Senators—I do not know which side they are on, but you need to make those views known to them because it is going to be very important. We are going to be taking up the Clean Air Bill conference shortly after we return, and I just want to make that point. It is important that you communicate that to the other body, as well as to us. And, we appreciate very much your position.

Ms. **Peters**. Thank you.

Mr. **Hammerschmidt**. Thank you.

The **Chairman**. Jim Inhofe.

Mr. **Inhofe**. Mr. Chairman, just one comment. I think it is coincidental, but a very pleasant coincident for us that today is the day that the EPA approved our state program that takes us off the non-payment list. Of course, we have a 30-day comment period, but it is—that alone—that Act alone can pretty much shorten a lot of testimony here today. We all rejoice in that, Donna.

Ms. **Peters**. Thank you.

Mr. **Laughlin**. Well, Ms. Peters, it certainly is a pleasure to hear your testimony. It brought to mind a joint meeting I had with our colleague, Congressman Jake Pickle, with whom I share a common boundary. He is the congressman for Austin, Texas. And we met with a group of water people, and your observation about regional planning among the local governments for waste is certainly well taken, and that was part of the focus of that meeting yesterday, along with water treatment for disposal water—in particular, ground water. So, you are hitting some real nails on the head, and I compliment you for that. Thank you very much.

Ms. **Peters**. Thank you.

The **Chairman**. Thank you, Greg.

Mel.

Mr. **Hancock**. I don't have any questions, Mr. Chairman.

The **Chairman**. Ms. Peters, to draw a new industry, you have to beef up your existing infrastructure. What kind of infrastructure shopping list are potentially new industries coming to you with, and have you been able to respond to their requests?

Ms. **Peters**. I am not familiar with specific shopping list requests for the area. I believe that the issues that I have touched on are important to the location of new industries, the transportation systems that access—for instance, many of the problems at the county—at the county level that we face are access to federal projects. For instance, such as the Corps of Engineer lakes or the proposed Tall Grass preserve area. I am not sure that I have got a detailed list that I can respond at the county level for you.

The **Chairman**. Ms. Peters, thank you very, very much for your presentation.

Ms. **Peters**. Thank you.

The **Chairman**. Our next two witnesses will be addressing general transportation needs. They are Mr. Brent Kitchen, Airport Director of Tulsa International Airport and Mr. Travis Freeman, Chairman of the Oklahoma Highway Commission. And let us see if we could perhaps begin with Mr. Kitchen. First, let me thank you for hosting us earlier today on the tour of the airport and briefing us on the third runway that is now being designed. So, let us start in that procedure then. Mr. Kitchen, I guess you are first. Is Mr. Freeman here?

Mr. **Freeman**. Yes, I am right here.

The **Chairman**. Well, your name is up there.

Mr. **Freeman**. Would you like for me to come up there now?

The **Chairman**. I thought we would have both of you. We might ask our questions because you are kind of on the same—in the same general area. You can sit there. And we will first hear from Mr. Kitchen and then we will hear from you.

TESTIMONY OF BRENT KITCHEN, AIRPORTS DIRECTOR, TULSA AIRPORT AUTHORITY; TRAVIS FREEMAN, PRESIDENT, OKLAHOMA HIGHWAY COMMISSION

Mr. **Kitchen**. Thank you, Mr. Chairman, members of the Committee. We certainly enjoyed our tour this afternoon, and we enjoyed first hand showing you our airport facilities.

Tulsa, as Jim Inhofe knows already very well, has a proud aviation history that has created a major air transportation center and an aerospace industry that has created the region's largest employer and has become the greatest economic generator for the region. As you saw at the airport this afternoon, we have seven major airlines, and they serve four surrounding states—or three surrounding states, as well as Oklahoma, eastern Oklahoma, northwestern Arkansas, southwestern Missouri and southeastern Kansas.

A total of 52 aviation-related businesses currently operate on Tulsa International Airport. These businesses provide 17,000 aerospace jobs, having an annual payroll of a half a billion dollars. Tulsa's aerospace industries contribute nearly $3 billion annually to the region's economy and, of course, one of our major tenants, as you saw this afternoon, is American Airlines, who is the state's largest employer, and you saw their maintenance and engineering center. They also have their Sabre reservation center located on the airport. I would like to add that these facilities are the largest and most modern of their kind in the free world.

All of this could not be possible—and let me say that it cannot be sustained—without continued funding commitments to improve our airport's facility. The airport's capital improvement program identifies 21 projects, totaling $150 million needed over the next seven years. These programs—there are two very large projects in this program. One of them is the addition of an air carrier runway, and the other is the acquisition of property for noise abatement and future airport development purposes.

These projects will not be constructed without a reliable funding source. It is for this reason that we commend you for recently passing the Federal Aviation Administration Airport Improvement Program Reauthorization Bill, H.R. 5170, and its passage of a passenger facility charge provisions for continued funding of necessary airport capital improvement projects. We are hopeful that the Senate will demonstrate the same leadership of providing a passenger facility provision as a local funding option and spending down at the aviation trust fund surpluses for airport development needs.

I would also like to go on record to support the FAA as a primary federal agency responsible for federal grant—federal programs that relate to airports. The FAA, in my opinion, has performed exceptionally well over the years in assisting airport operators with safety, security, construction and funding programs. It is very important to us that this continuity of administering federal programs be maintained and be maintained through one agency.

Congressman Inhofe reminded me there is a couple of other issues that I would like to bring to your attention also, and that is the non-revenue passenger not being counted in the AIP funding formula. If that was thrown in and those people do pay the eight percent ticket tax—by the way, it would mean another $124,000 of federal funding to Tulsa International. If the passenger facility charge was created, that would create another $3 million for us that would help and fund the projects that we have listed.

I would also like to go on record as supporting H.R. 5315. I think Congressman Inhofe has been involved in that and Congressman Anderson also. And that is to remove the aviation trust fund from the United—or unified federal budget to allow the aviation trust fund monies to be utilized as intended. And the recently passed H.R. 5130, the civil penalty assessment program which enables airport tenants to develop a security program which they administer and resume financial responsibility.

And with that, I thank you for your consideration of these important issues.

The CHAIRMAN. Before we ask any questions, we will hear from Mr. Freeman.

[The prepared statement of Mr. Kitchen appears on p. 1375.]

Mr. FREEMAN. Mr. Chairman, thank you very much. I am Travis Freeman, the Commissioner from this district. I am also the Chairman of the eight-member Transportation Commission of the State of Oklahoma. With me are our Transportation Secretary, Mr. Neil McCaleb, and the Director of ODOT, Jack Blaze. You have before you an Oklahoma perspective. My comments will not follow that in any way. Most people tell me in our staff that that is the way I always operate. I would like you to look at that in detail because it covers a great deal of our operation. But, I want to talk to you just in general about what the needs are in this district and the state of Oklahoma and how we hope that together we can supply the solutions to those needs.

Oklahoma has approximately 12,000 miles of state highways, 86,000 miles of county roads, 1,000 miles of interstate highways. And in this district, those miles are about 350 state, 3,100 county and 50 interstate miles of very, very heavily traveled roads. Thirty percent of our state highways are classified as inadequate. And what bothers us the most, of course, is that on inadequate highways, the accident rate is about 66 percent more than it is on those that are classified adequate.

We have a program to upgrade approximately 200 miles statewide of inadequate highways each year. But, we are running into some difficulty in carrying that out because of the cost escalation and construction and the change in the attitude of what is good highway design. As an example, cloverleaf design on intersections in urban areas have become very unsafe and inefficient. The solutions now call for more complicated and expensive interchange design with directional movements.

In Tulsa, for instance, if we take an intersection over here at the Broken Arrow Expressway and I–44, which is the Skelley Bypass, we are looking at a redoing of that one interchange with a ticket of about $40 to 50 million. That is a sizable package, and it would require a commitment for funds from the 1st District of over three years just to do that job. And of course, it is competing with other needs in this district which amount to approximately $300 million just for that expressway corridor. So, you can see that it is a very, very difficult situation for the upgrading and the maintaining of just those highways.

Over the next 20 years, additional needs for the State of Oklahoma will accrue greatly because of increased construction and traffic and the maintenance of those facilities we now have in place. And this is a number that gets my attention very greatly. We project that on that 20-year period, it is going to require $13 billion in order for us to do the job. Those funds just are not in the system, gentlemen. They are not in the system here. They are not in the system anywhere. And therefore, it means that we are going to have to have increased revenues if we are going to do our job of providing a safe, adequate and attractive highway system for the citizens of Oklahoma. And the first two main items that have to be addressed and where you really come in more than we do, is item number one. We must spend down the highway trust fund. And item number two, we must keep fuels taxes exclusively for building and maintaining highways.

In addition, I agree with the Mayor and most anybody else that has talked here. We need to have a little more flexibility built in to the funding program. The current and complex structure of the federal aid highway program has more than 35 funding categories. We believe that a two-part structure should be the wave of the future.

In Oklahoma, we are particularly proud of the fact, gentlemen, that we do not just use tax dollars to build our highways. We try to be as efficient as possible, and you are probably familiar with the fact that we have a turnpike system that is quite adequate. We have almost 500 miles of turnpikes in operation, and we are in construction of 75—76 miles more. That construction of the 76 miles going on right now has a total bill of $360 million. That $360 million means that we can use that money, instead of tax dollars, to build other roads. And that is extremely important to our ability to get the job done.

And because we do that and because we constantly work on how we can better be efficient, right now, we have underway a Highway Users' Federation study of our entire operation. We formed a task force to look into long-range planning and finance and also a task force to look into privatization. Because we do these things, we have always had a great concern about the fact that we are a donor state. We get less of the money our people send to the highway trust fund back than we think we should. And therefore, we would like to recommend that when you get into any new program, that a donor/donee relationship among states should be avoided.

You people have had the pleasure—and I hope it was a pleasure—of traveling around this area today, and I hope that you have been impressed. I have lived here for 40 years, and I think I have some idea of the attributes of Tulsa. I think we have an almost unique set of assets in our airport, our waterway, our surface transportation system and something that is overlooked quite a bit, but has a great impact on this area, and that is an almost inexhaustible supply of good raw water. If we can continue to build on and maintain these facilities, there is not any doubt that Tulsa and this part of the world are going to move into the decade of the 90's with great vigor, and I would say we will probably have explosive growth through the 21st Century. But, we cannot do it alone.

It is the sort of thing, gentlemen—that is one of the reasons we are happy you are here. We are delighted to work with concerned persons such as you, in particular with our friend, Jim Inhofe, whom I happen to believe and for a long time have believed is one of our most dedicated and talented public servants. And if we all work together, I think—not only in this district, but in Oklahoma and the country, we can probably get there and we intend to get there. Thanks again for being with us.

[The prepared statement of Mr. Freeman appears on p. 1359.]

The **Chairman**. Gentlemen, I want to thank both of you for your statements. I have one question. If the Committee—this Committee—were to produce an infrastructure bill providing assistance to local governments for their flexible use on a wide range of local infrastructure needs, but held some money back to be distributed on a discretionary basis for the most cost-effective projects, what type of infrastructure projects would typically be funded and what are the most cost-effective infrastructure projects, and will this vary from one state or from one community to another? That is a pretty broad question.

Mr. **Kitchen**. I should have taken notes on that question. But, I think under the Airport Improvement Program, there is a discretionary funding program, and I think it has worked very well. When an airport project is undertaken, especially a major project such as the Denver Airport or our third runway, it will not fit into the regular enplanement formula basis. And I think that is why the discretionary fund was set up, and I think it is working very well. And I think it is distributed very well. We receive—have received in the past quite a bit of discretionary funding at Tulsa International for large projects, and that works very well. I am not sure I answered all of your question.

The **Chairman**. You did fine.

Congressman Hammerschmidt.

Mr. **Hammerschmidt**. Well, thank you both for very fine statements—very informative statements.

Mr. **McCaleb**. If I might, Congressman Hammerschmidt. May I——

The **Chairman**. Certainly.

Mr. **McCaleb**. My name is Neal McCaleb. I am Secretary of Transportation, and I would like to answer on behalf of Chairman Freeman. From our point of view——

Mr. **Hammerschmidt**. It's the Chairman's question.

Mr. **McCaleb** [continuing]. These two questions.

Mr. **Hammerschmidt**. Put that in the record if you would.

Mr. **McCaleb**. First of all, on the local basis, the way we would use the money in the flexible program would address two types of projects. One would be like the megabuck projects, like the $40 million interchange, and we have three of those kinds of interchanges, by the way, in Tulsa now under study. Another kind of project that we would address are the local street improvement projects. An example, we got some additional money is the Yale Street improvement, which is a $7.5 million project to widen Yale Avenue for a little—for about a mile and a quarter. We just got about $10.5 million in additional obligation authority from the Federal Highway Administration, and we are able to put that project on the October levee. That defines what we would do locally with those kinds of flexible funds.

In terms of what we would do on the—in the interstate areas, I think that is a particularly important question to us. We are very much interested in the regional connection and access of Tulsa, northeastern Oklahoma with northwestern Arkansas, southwestern Missouri via the improvement of U.S. 71 through a continuous four-lane facility from Kansas City into its connection with the interstate in Texas and our connection with U.S. 412, which we have four-laned—are in the process of four laning from Enid, far west of us, all the way to the Arkansas line in Siloam Springs for the remaining 28 miles to its junction with U.S. 71 at Springdale. That is the kind of regional interconnection that we would see that discretionary money going to.

Mr. **Hammerschmidt**. I thank you very much for making those points. And obviously, I have a great concern in it because I can see that divided four-lane highway coming right in there to Siloam Springs, Arkansas and dumping out traffic onto a two-lane road, and we are not prepared to respond to that. And we are going to have hearings, as you know, next week—not to fix that problem, but to discuss that problem. And as we move into this next phase of highway legislation, which will be written by next year, maybe drafted, some of it by the last of this year, it is those type issues, we are going to have to speak to and how would we best interface and serve the state. Obviously, we know that it breaks faith for the American people not to spend money out of these trust funds. We have come close on the House floor within five votes of taking one of those trust funds off budget. And now, for the first time, a major legislative committee has passed through its committee legislation to take those trust funds off budget into the unified budget.

But if I can move back over to Mr. Kitchen's statement and the passenger facility charge bill—the aviation bill. As you know, in that bill, there is—it mandates that we spend down from $7.6 billion in the aviation trust fund to $1 billion in a five-year period. If we could do something like that on surface transportation, I think everybody would be tickled to death. You cannot just suddenly take those trust funds off budget; but if we could spend them down in an orderly fashion over a fairly short period of time—five years or maybe even a little longer, we would go a long way.

As Mr. Freeman says, even if you do that, the states would only receive about a year and a half windfall, so to speak. I mean, it would not solve the problem. There is just not enough money in the system at this time. And of course, that is kind of what these hearings are about, although we are talking about general infrastructure. But certainly, roads and airports are a major part of that in urban transportation.

But, I will not go on here, except I know we are all in sync and we want to try to work together to find common solutions to a problem that we all know exists. We thank you very much for your excellent statements. Thank you.

The **Chairman**. Mr. Laughlin.

Mr. **Laughlin**. Thank you, Mr. Chairman. I concur with Mr. Hammerschmidt's observations, and I will not ask any questions because your testimony was informative and I agree with it. Thank you very much.

The **Chairman**. Mel.

Mr. **Hancock**. I do not have any questions.

The **Chairman**. Jim.

Mr. **Inhofe**. Mr. Chairman—just for your assurances, under the leadership of Chairman Anderson, each one of us—and this is kind of split even, Democrat and Republican on this Committee in the representation here today—strongly supported the PFC allowing you to do the work if you can sell it to the public. Of course, that is—that has to be done, too, because there are elected members on their board authority, which is true throughout the nation. As well as getting the—all trust funds off budget. This is something that has been done. It is a smoke and mirrors technique that Congress has used. But, it is the Chairman's leadership that has kept us all unanimously in line in getting that done. As Congressman Hammerschmidt said, in the case of the airport—aviation trust fund, we—a couple of years ago, were within five votes of doing that. So, we think these are do-able now, and we are on the road to correcting that problem. So, we are on your side on that.

The **Chairman**. Thank you very much.

Our next and our final panel of witnesses will be addressing waterway needs. They are Col. F. Lee Smith, the Director of the Tulsa District United States Corps of Engineers and Mr. Robert Portiss, Director of the Port of Catoosa. They will be accompanied by General Stanley Genega, Commander of the Southwestern Region of the Corps. And welcome to—all three of you. And I think we might begin with Col. Smith.

TESTIMONY OF COL. F. LEE SMITH, COMMANDER, TULSA DISTRICT, U.S. CORPS OF ENGINEERS; ROBERT W. PORTISS, PORT DIRECTOR, TULSA PORT OF CATOOSA; AND GEN. STANLEY GENEGA, COMMANDER, SOUTHWESTERN REGION, U.S. CORPS OF ENGINEERS

Colonel **Smith**. Thank you, Mr. Chairman, members of the Committee. It is a pleasure for me to be with you today and participate in your hearing as a representative of the Tulsa District of the United States Army Corps of Engineers. Throughout our nation's history, the corps has actively planned, designed, constructed, operated and maintained important aspects of our nation's infrastructure and continues in this tradition today. The corps fully supports your Committee's focus here today on infrastructure as most appropriate.

I am proud to be Commander of the United States Army Corps of Engineers district which has served Oklahoma with great commitment and distinction for many years. A premier feature of this service has been the Oklahoma portion of the 17 locks and four hydropower facilities on McClellan-Kerr Arkansas River navigation system. Were it not for the federal participation through the corps in this navigation system, the waterborne commerce in this region of the country, which has proven to be clearly in the benefit of the total nation, would not have been possible.

Another premier portion of the corps' contribution to the economic well-being of this part of the country has been in the area of flood control. Historically, this region has been victimized by flooding, costing lives and imposing severe adverse economic impact. An example of our most recent ongoing involvement in flood control is our successful partnership with the City of Tulsa. Through this cooperative approach, the citizens of Tulsa will soon see a substantial reduction to the devastating flooding caused by Mingo Creek. In 1980 alone, flooding of Mingo Creek caused four deaths, some $124 million in damages. When completed in 1995, some 23 flood water retention facilities on nearly 700 acres in over ten miles of improved channels will provide a 100 year frequency flood protection level. This important $186 million investment is estimated to accrue benefits averaging over $32 million a year when completed.

Another important aspect of the corps' involvement in infrastructure associated with flood control is our local Tulsa-West Tulsa levee system. This system alone currently provides flood protection on the Arkansas River to property valued in excess of $1.2 billion. The federal money spent in 1945 to construct this levee system has proven many times over to have been money well spent. Though this project is nearing the end of its programmed economic life, the levees have the potential for many more years of service. However, these levees need rehabilitation beyond that envisioned originally by the local sponsor. This need for rehabilitation remains a source of concern to the corps since the 1986 flood on the Arkansas River clearly demonstrated the need for and importance of these levees.

In closing, I would like to emphasize the long-standing commitment of the United States Corps of Engineers to the wise management of our nation's resources. As we look to the future, the challenges are many and the need to prioritize funding for water resources will be as important as ever.

The corps' long-standing involvement in providing a portion of our nation's infrastructure has generated expertise and accountability to the nation which have withstood the test of time. Our benefit-to-cost methodology has proven to be a dependable indicator of sound federal economic investment. The corps' use of federal and local cost-sharing partnerships has produced outstanding results not only here in Oklahoma, but throughout the nation. Our efforts in environmental enhancement and recreation, as well as hazardous and toxic waste cleanup have established the Corps of Engineers as what we believe to be the best public engineering agency in the world. The corps has pledged itself to continued service as our nation addresses its infrastructure challenges today and tomorrow.

I thank you for the opportunity to address this Committee this afternoon and would be pleased to respond to any questions you may have.

The CHAIRMAN. Mr. Portiss.

[The prepared statement of Col. Smith appears on p. 1404.]

Mr. PORTISS. Mr. Chairman and other distinguished members of the Committee. It was an honor for me to be able to tour you through our Port today. I want to especially thank our own Congressman, Congressman Jim Inhofe, for his outstanding support. Every time we have called on him relative to our waterway or our port, things that we need done within the Congress, you have responded quickly and very effectively, and we appreciate that.

My statement is already a matter of the record, I believe. I submitted it to you yesterday. I am not going to repeat what you saw this afternoon, or at least I will try not to. The thing that I would like to impress upon the Committee is the fact that what you saw this afternoon and our $1.3 billion navigation system is now in jeopardy. We must have a lock and dam built at the confluence of the White and the Mississippi, or the entrance channel, if you will, to the McClellan Curve. Or our port and the public investment made by the citizens of this area, our metropolitan area, the $21.2 million in G.O. bonds, in other words, plus the additional $5 million in investment that our Port Authority has supplemented to maintain the Port, as well as additional capital improvements, will be in jeopardy. The $194 million in private investments that are out there today, after 20 years now of growth. And the hundreds of millions of dollars that have been invested by private and other non-federal public entities along the McClellan Curve in Arkansas and in Oklahoma as part of the joint venture investment, if you will, in that navigation system. Why do we need this lock?

Our friends with the Corps of Engineers, as you know, at least in my 20 years of experience in working with them, are very careful in their predictions and their projections. They have now determined, after many years of study, and they have officially stated that the White—the Mississippi River at the entrance to our navigation system will, in fact, drop its surface elevation by 15 feet over the next 30 years. And considering that the depth of the White River entrance channel is only 15 feet, so goes the system. You literally will be able to walk up that first ten miles of the McClellan Curve. Obviously, shippers over the past four to five years that have experienced low levels of water depths at that particular location have said, "Either get it fixed, or we leave the system. We cannot afford to have a $700,000 barge load of steel sit there for 30-60 days and not be able to get our hands on it."

We do have a very severe problem, and I realize I am speaking to the choir, in a sense, because your committee has been very supportive of this project and we owe much to Chairman Anderson for clarifying for the record in the Congress this past year that Montgomery Point lock and dam was, in fact, authorized in 1946. That was an outstanding question that has now been resolved.

As we look ahead with the turnaround in the Eastern Bloc countries, if you will, where we are seeing the transformation from Communism to Democracy and the tremendous trade opportunities with those particular countries which fit the Gulf Coast, whereas the Far East was really through the West Coast, we have an opportunity to serve the central—continue to serve the central part of the United States with this Port out here and its waterway—which incidentally, if I did not mention it today—here in the heart of America, the grapes of wrath state, if you will—at least, as we are often referred to—this Port that our citizens invested in is the largest inland port in the United States.

We have also—thanks to Congressman Inhofe, been able to move military equipment by water for the first time since World War II. The icing on the cake of which was the 101st Airborne that moved two different tows, each of which were the length of three football fields. That is something that was started here in Oklahoma, and that is something that has continued and we hope will become a permanent part of military doctrine in the future.

In closing, our metropolitan area has helped make this waterway work. It has fulfilled its investment commitment as promised. It is a regional facility serving five states, and we trust that your Committee will continue to support our efforts. Thank you very much.

The CHAIRMAN. Thank you.

I have a question, I think, for the whole panel.

Mr. INHOFE. General Genega is here.

The CHAIRMAN. General.

[The prepared statement of Mr. Portiss appears on p. 1395.]

General GENEGA. If I might just a moment, Mr. Chairman, Committee members. I am very pleased to be here. I leave the substance of the statement to Colonel Smith. But, I share the concern of the Committee members about the infrastructure, and I look forward to working with the Committee. As you know, I am very new to my job—to the present job and look forward to working with the Committee and the local communities to find solutions to those infrastructure problems where our charter permits. It is a privilege to be a service to people of Oklahoma, and I look forward to seeing the Committee next week in Arkansas. Thank you.

The CHAIRMAN. Thank you very much, General.

My question to the entire panel is this, do you believe that better infrastructure—whether it be ports or other waterway facilities—would result in a stronger economy for this area, and if so, how?

Mr. PORTISS. Do you want to tackle that?

Col. SMITH. Mr. Chairman, I can only observe where we have been and speculate to where that will take us. It is my opinion that the infrastructure that the Corps of Engineers has participated, be it the port system on the eastern seaboard and then the movement west and the Corps of Engineers' involvement has, by every measure, stimulated the economic well being and development of this nation. Whether that generalization can be applied to a specific area of which comes first, the chicken or the egg? I think it is more of a question that is a hand and glove cooperation. Without infrastructure—the water, the power, the rail, water network and such—the opportunities for economic development diminish. Where those facilities are provided through federal or local infrastructure, then the fertile ground is there for the economic development. Can there be economic development without the infrastructure? Yes, but under far more difficult circumstances.

The CHAIRMAN. Thank you.

Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Mr. Chairman, I do not have any questions. I want to thank you gentlemen for very fine statements and being here at our hearing.

The CHAIRMAN. Let us start off with Mel.

Mr. HANCOCK. I do not have any questions. I just am pleased that they are looking at this tri-state area. I think we have to look at it as a whole unit, rather than picking and choosing either Tulsa or southwest Missouri or Springdale, Arkansas. I think we have to look at how it affects the entire unit and, naturally, this unit here affects the district down there. I think sometimes, Mr. Chairman, that we have—that the Congress has reacted almost by Congressional district, rather than look at what is good for the whole—you know—for the whole community or the whole area of maybe four, five or six states. And I think that is part of the—one of the reasons why I am pleased to serve on this Committee because this Committee does look at major areas, rather than picking and choosing. And I appreciate the testimony of each of them because it is obvious that is what they are looking at.

Mr. HAMMERSCHMIDT. Would the gentlemen yield? Commenting about our mutual needs here in this area, I probably should just say that we are very aware, as Mr. Portiss knows, about the needs of Montgomery Point lock and dam and how it does affect all of us in this entire area. And in the colloquy that we had on the House floor, we tried to clarify that there is an authorization for that lock and dam. We might even put a new authorization bill in just to clarify that doubt. I do not know whether we will move forward with that or not. But, we do know that it ought to be built, and I think the next order of business is to get an appropriation for the study and to move forward with it.

I thank you, gentlemen, for yielding.

Mr. HANCOCK. One other comment. One of the things I would like to mention that they mentioned was Highway 71. That is a project that is key to the economic development of this whole area, especially in the southern part. Actually, there is more of it south in Arkansas than there is in my district. But it is a very essential item for the area—this whole tri-state area, and thank you for mentioning it.

The CHAIRMAN. Congressman Greg Laughlin.

Mr. LAUGHLIN. Thank you, Mr. Chairman. I now will have to amend my statements I often make about the Gulf intercoastal waterway in my district. I have always said, you could turn south and go to Mexico or either turn north and go all the way to north of Pittsburgh, Pennsylvania. But, I will also have to say you go north and turn west and go to Tulsa, Oklahoma. I am impressed with what you have.

But, I think you ought to also be aware of another observation we have is we are taking up the Hazardous Material Transportation Act in our Surface Transportation Subcommittee, and that is the waterway system does provide a tremendous relief to our communities and our highways for the transportation of hazardous material. And I am particularly mindful of that because along the waterway system in my district, we have numerous petrochemical plants. If we did not have that waterway system, those toxic chemicals and toxic materials would be going through our communities, going near our schoolhouses and hospitals and homes. And added to the fact that our highways and bridges could not tolerate the weight of those materials, along with the safety factor, I think those of us who are privileged to have the sound waterway system that you have and that we have in Texas should remind the public that there is an additional benefit to maintaining that waterway system.

And when you talk about the Montgomery Point lock and dam, and I have complete compassion for the problems it has for you and the potential loss to your area in that the Corps of Engineers in most areas can readily tell you that I will not talk to them unless they acknowledge the erosion at Sergeant Beach. My district will cripple and abolish the Gulf intercoastal waterway system if we do not get it corrected. And I see you are facing the same thing. And three weeks ago, the Chairman and Mel Hancock heard testimony along those lines.

So, that is the value of these type hearings. I could not have—nor could the other members of this Committee—probably Mr. Hancock and Mr. Hammerschmidt could have because they are neighbors—but, I certainly could not have appreciated the potential loss to this region. Not to the 1st District of Arkansas alone—I mean, Oklahoma—alone, but to Arkansas and Missouri, in addition to Oklahoma. So, it has been of great value to me, and I appreciate the input you all have given us. Thank you.

The **CHAIRMAN**. Thank you, Greg.

Congressman Jim Inhofe.

Mr. **INHOFE**. Mr. Chairman, as I said earlier, the reason for our changing from the—deviating from the normal script and having a tour for half of our hearing was actually seeing it. We have so many things in the 1st Congressional District and throughout Oklahoma that you really have to see to overcome that perception that perhaps the Chairman had when he was going through basic training here. Because you have to come to see it to really appreciate it.

I was trying to get Bob Portiss to say something on the bus tour, Mr. Chairman, about the Montgomery Point lock and dam and about a particular investment we had. I know now why he did not because he is putting the emphasis on us here. And I think you already know that those up here at this table have talked about this problem—about protecting that investment. And for all practical purposes, maybe simplistically stating it, if we do not do that, it is all gone. The entire investment of not just the local region, as we are pointing out, but the entire United States of America.

And with that goes impairment to our nation's security, now that we are looking at this as a military transfer point. And one of the questions that the Chairman had asked. I think I probably would have added to the answer that you gave that if we are able to expand that, that would singularly be a great—have a great positive economic impact on our entire area to enhance that transportation portion of our region. So, we have an investment to protect here, and I think that we have all been able to see it first hand now. And again, Mr. Chairman, I appreciate so much your coming here and seeing these things first hand.

The **CHAIRMAN**. Thank you, Jim.

Well, I want to thank all of our witnesses here today for their expertise and for helping us better understand the importance of our Nation's infrastructure needs from the perspective of the state of Oklahoma. I also want to thank the people of the 1st District for their warmth and hospitality. And Jim, I thank you for your untiring interest and enthusiasm and your staff for their hard work in making today's hearing possible. And John Paul and Greg and Mel, thank you for joining us, and I look forward to tomorrow's hearing in Mel's district.

With that, the Committee stands adjourned. Thank you very much.

[Whereupon, at 6:10 p.m., the Committee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

Prepared Statement of Travis Freeman

The Oklahoma Perspective:

Moving Oklahoma's Transportation System into the Twentieth Century

September 1990

LET'S GET THERE!

American Transportation: At the Crossroads

On September 30, 1991, the current federal surface transportation program will expire. Over the next several months, the Congress will have the opportunity to rethink the mission of federal surface transportation program, and to reshape those programs into new programs for today's needs.

New transportation ideas must redirect federal transportation programs to meet the challenges of a rapidly approaching new century. The Congress now faces choices that will guide us for the next several decades.

Now that America has successfully built the best transportation network in the world, it must determine how it grows and what role it will play the future success of the United States.

Today, the Interstate Highway System is essentially complete. Begun in 1956, the Interstates were established for military deployment needs in the post World War II era. As interstate and international commerce grew, so did America's dependency on highway transportation for movement of goods and people. We have united our nation through the effective movement of people and goods.

During the past 35 years, however, Oklahoma and our nation have both changed significantly. We have become more metropolitan, and face new economic and environmental challenges. The new Federal-aid Surface Transportation Assistance Act must support our full participation the global marketplace.

During the past decade Oklahoma's transportation challenge has become acute. Our ability to compete effectively in the world and the United States is the challenge presented to our surface transportation system. Oklahoma must be able to address our most important transportation needs:

- Maintaining our existing system

- Improved mobility through increased capacity and reduced congestion
- Preserving and enhancing safety

To better enable Oklahoma to meet these challenges, the new Federal-aid Surface Transportation Assistance Act must:

- Restructure the federal-state partnership and the current federal-aid program
- Revise the formula through which federal funds are distributed to the states
- Increase the levels of federal transportation funding

The Administration Proposal

The current federal administration has recommended a fundamental restructuring of the federal transportation program:

- Giving priority to preserving needed transportation infrastructure
- Maintaining a high level of transportation safety
- Increasing the emphasis on integrated state, local and regional transportation planning
- Ensuring that transportation systems of national significance have the new capacity that is essential to meet critical national needs
- Focusing federal assistance on selected highways of "national significance"
- Shifting to the states an even greater share of the cost burden for building and maintaining the nation's highways and public transportation systems
- Funding transportation improvement through increased user fees, including tolls

- Increasing the rate of expenditure from the Highway Trust Fund
- Increasing state flexibility to design solutions for their transportation problems
- Eliminating federal funding for mass transit operating costs
- Increasing the flexibility in federal financing for other public transportation projects
- Making sound infrastructure management a condition for federal aid

The Oklahoma Perspective

Today about 70 percent of total funding for both highways and public transportation nationwide comes from state and local governments.

Oklahoma has more than 12,300 miles of state highways, 86,000 miles of county roads, and about 1,000 miles of Interstate highways. More than 32.5 billion vehicle miles were travelled in Oklahoma last year over those roads. And they traveled more safely than ever before. Since 1980, Oklahoma has recognized a 46 percent reduction in highway fatalities per million miles travelled.

Dollars spent on transportation do not take money out of the economy; they bring money in! For every public dollar spent to build and operate the nation's roads and bridges, private firms and individuals spend $15. And highway expenditures may also be the best investment Oklahoma can make to attract industry -- better than reducing taxes.

The Federal Role

National defense, interstate and international commerce, and the safety and mobility of our people -- these underlying responsibilities of our federal government should shape the federal role in transportation.

However, federal involvement should support, not inhibit, the creativity that marks the uniqueness of our states. Current program limits and requirement often prevent the most efficient use of federal dollars.

Regardless of funding levels, the future federal role in the transportation partnership with the states should be simple and flexible.

Highways

Rather than the complex structure of the current federal-aid highway program -- which spreads federal highway funding among more than 35 funding categories -- Oklahoma advocates a simpler federal program structure. We join with the American Association of State and Highway Transportation Officials (AASHTO) in recommending a two-part program structure -- a "categorical" or "focused" program and a "flexible" program -- for both highways and public transportation.

The National Highway System (NHS)

The basic reasons for federal involvement in transportation demand a national highway system that is limited in size, but critical to the economic health and international vitality of Oklahoma and of this nation. A single, new categorical highway program would address the needs of the National Highway System (NHS).

The existing 42,800-mile Interstate Highway System would remain the heart of the planned 100,000- to 150,000-mile NHS. However, the NHS must reach out to new population centers and new markets -- to cities like Woodward, Altus, Atoka and Ada. These new economic centers are far from Interstate routes designated more than 30 years ago.

The NHS would extend beyond the Interstate system to include appropriate principal arterial highways. Each state would designate its principal arterial segments to be included in the NHS, following a process established by federal law or regulation.

Selection would be based on criteria that reflect national transportation objectives. The U.S. Department of Transportation (USDOT) would review and approve the state-designated segments.

About 2,300 miles (1.9 percent) of the NHS would be in Oklahoma, if the NHS was a 100,000-mile system. If the NHS grows in size, the Oklahoma share of that system would grow as well.

We are not suggesting an expansion of the Interstate Highway System. Segments of the NHS beyond the Interstate would not necessarily be built to Interstate standards.

Oklahoma recommends that the actual designation of NHS components should take place after the NHS program is created and its funding levels established. Funding apportionments to a state for its NHS would be based on statewide factors other than NHS-system mileage. Thus, the NHS would be decoupled from the formula factors and avoid incentives for a particular state to inflate the size of its NHS segments.

The Flexible Highway Program

National interests in transportation extend beyond the NHS, however. Urban and suburban congestion costs us $73 billion each year, including billions of dollars in Oklahoma alone. Oklahomans in small cities and rural communities need safe and efficient access to the NHS. All Americans deserve consistent safety and quality standards on those highway systems supporting the NHS, and smooth connections among the different forms of transportation.

Especially on this supporting highway network, each state and local government should have the flexibility to meet its unique mix of rural and urban transportation needs.

Through the Flexible Program, the federal government should provide funding assistance to the states for rural/urban highway needs beyond the NHS. States should also have the flexibility to use these funds to meet their public transportation needs.

This concept of a Flexible Program was a response from the Bush Administration to Oklahoma and other governors and transportation leaders when they requested a four-cent turnback in federal motor fuels taxes from the Administration.

This increased flexibility ensures the best use of limited federal resources to preserve and expand our transportation infrastructure. Through the support of the Federal Highway Administration (FHWA) the state highway agencies are now highly competent. These capable state professionals are also closer to their own highway problems than either the Congress or USDOT. They can create more effective solutions and can balance the use of resources among competing needs more effectively.

Project Selection

The structural changes recommended above should eliminate the need for Congress to use "demonstration projects" to address important transportation needs. For example, gaps in today's complex national transportation assistance structure have encouraged Congress to create projects to provide highway access to air and water ports. Under the structure Oklahoma and AASHTO recommend, these projects could be addressed readily through the NHS Program.

Any other projects of special Congressional interest should be authorized by Congress, if at all, only when they meet certain funding and program criteria. Those projects should have:

- High priority in the statewide program of projects
- High priority in the local jurisdiction
- State and local agencies willing to share appropriately in project costs based on expected project benefits

Any demonstration projects established by the Congress within these criteria should be funded from a state's current apportionment of obligational authority.

Accountability

The new federal-aid highway program should assure the Congress that federal funding improves the performance and capacity of the nation's transportation system. Oklahoma agrees with the administration's National Transportation Policy that sound infrastructure management should be a condition for federal aid.

Any federal planning process should allow for the diversity among the states. Each state should be able to prepare and implement its plans using criteria appropriate to its particular circumstances. The plans should be dynamic, multi-modal, and strategic in approach, and should be amendable without sanctions. State reports on the implementation of these plans should substitute for other program controls, such as performance measures, to assure the Congress that federal funds are being used to improve the highway system.

Program Funding

Oklahoma agrees with AASHTO's recommendation on the distribution of federal highway funds among programs. First, a sufficient portion of the total federal funds provided for highways should be set aside initially for a modest (not to exceed two percent of total highway funding) discretionary bridge program, emergency relief, and federal lands roads program. The remaining funds should be divided equally between the NHS Program and the Flexible Program, with a provision to allow up to 20 percent of transfer of funds between the two programs.

Public Transportation

Neither Oklahoma nor AASHTO seek major changes in the current structure of federal assistance to public transportation. We support the American Public Transportation Association (APTA) recommendations to expand the types of projects eligible for federal funding assistance through the current formula program. Formula funding should be available for operating assistance to public transportation programs in rural and small urban areas, and for rehabilitation of existing systems and new transit service needs beyond major metropolitan areas.

In addition to traditional bus and rail transit projects, formula funding should be available for high-occupancy vehicle (HOV) lanes, traffic signal improvements, capital improvements to commuter rail, and transportation system management efforts targeting ride-sharing and transit.

We agree with AASHTO's recommendations that substantial federal financing for public transportation should continue. Public transportation in Oklahoma would best be served if General Revenue funding continues for "formula" public transportation programs (Urban Mass Transportation Act Sections 9, 16b, and 18) (UMTA). We also believe that funding for the UMTA's discretionary program should continue at its present level. Any increase in funding for the federal public transportation program from the Mass Transit Account of the Highway Trust Fund should be distributed by formula.

Federal Fund Distribution Formulas

Consolidating and reshaping federal transportation programs to reflect more effectively our national goals is essential, but not the final answer. The formulas allocating federal program funds to the states were created for another era. Many are based on outdated factors such as land area and rural postal delivery route mileage. Perhaps they were appropriate for Oklahoma and for America in the 1920s. Then, our goal was "getting the farmer out of the mud." Today, one of our challenges is getting a businessman holding an international airline ticket through gridlocked roads to the airport.

Highways

Oklahoma agrees with AASHTO that, in the shift to a new program structure, no state should experience a reduction in basic federal funding. The new Federal-Aid Surface Transportation Assistance Act should ensure that each state will receive at least as much in total federal highway funding under the new program as it received in fiscal 1991, assuming that all states had completed their Interstate highway systems. This minimum funding threshold would not include any Interstate Completion funding above the one-half percent minimum, or any discretionary or demonstration project funding.

The National Highway System

Oklahoma recommends that a particular state's share of National Highway System (NHS) funding should be determined using factors that correlate well with those basic national interests served by transportation. This is critical if sound public policy is to guide the states in designating their NHS segments.

Oklahoma supports AASHTO's recommendation that the formula for the state-by-state distribution of NHS funds use the following factors:

- Total statewide urban and rural lane miles
- Total statewide urban and rural vehicle miles travelled (VMT)
- "Other appropriate factors"

AASHTO did not specify what these "other appropriate factors" should be, or indicate what weight should be given to each of the factors.
However, support for interstate commerce, and the national economic benefits that flow from such support, is one of the principal national interests upon which federal support for transportation rests.

Oklahoma believes that factors reflecting the intensity of heavy truck travel should have significant weight in the NHS allocation formula. Including heavy truck travel as a factor would respond to the major impact trucks have on highway design, construction and maintenance. It would particularly help compensate several western states for the heavy wear and tear on their roadways which serve as a "bridge" for truck traffic between other states.

We believe diesel fuel consumption is the best available indicator of commercial or heavy truck travel. Diesel consumption data are consistently collected and relatively accurate. Therefore, Oklahoma recommends diesel fuel consumption be accepted as the "other appropriate factor" in the NHS allocation formula.

Each of these factors should be assigned a weight in the NHS allocation formula so available funds will be distributed equitably and effectively. The formula should:

- Provide states with the federal funding to meet future transportation challenges without sudden disruptions in their current programs
- Ensure Oklahomans receive a fair return on their transportation investment. For many years, Oklahomans have received significantly less than $1 in federal transportation funding returned to the state for every $1 in transportation taxes and user fees they paid into the Highway and the Transit Trust Funds

Oklahoma supports an allocation system which would distribute NHS funds as follows:

- Two-ninths based on total statewide rural lane miles and vehicle-miles travelled (VMT)
- Four-ninths based on total statewide urban lane miles and VMT
- Three-ninths based on total statewide diesel fuel consumption

To ensure equity and prevent program disruption, we also recommend three minimum funding level guarantees:

- Each state should receive at least one-half of 1 percent of total NHS apportionments
- Each state should receive an NHS apportionment that is at least 85 percent of the state's estimated tax payments into the Highway Account of the Highway Trust Fund. (This recommendation ends the "Donor-Donee" aspect of the Trust Fund, in which some states, donors like Oklahoma, contribute more to the Trust Fund than they are apportioned, while other states, donees, reap apportionments of more than 100 percent of their contributions.)

- Each state should receive at least a 25 percent share of any percentage increase in total program size

To ensure that states with a low population density receive adequate NHS funding to address their special problems, Congress should consider providing a "low population density" supplement to the NHS allocation formula.

The Flexible Program

While providing critical support to important national mobility needs, the Flexible Program pursues objectives that are predominantly related to the state and local transportation system.

A "donor-donee" relationship (see above) among states should be avoided. Each state should simply be allocated a pro rata share of total Flexible Program funds based upon the share of total federal highway user contributions to the Highway Trust Fund attributable to that state. That is, under the Flexible Program, Oklahoma would receive a 100 percent return on its federal transportation tax investment.

To ensure fairness in distributing Flexible Program apportionments, Congress should encourage each state to allocate a portion of its Flexible Program funds to non-state systems.

The portion of Flexible Program funds allocated to those systems, in the aggregate, should initially be no less than the percentage of FY 1991 apportionment of urban funds, secondary funds, and bridge funds made available to non-state systems in that state.

Transfer of Funds Between Programs

No formula can completely accommodate all the differing needs among the states. Oklahoma therefore supports AASHTO's recommendation that each state should have the discretion to shift up to 20 percent of a state's total highway allocation (that is, both NHS and Flexible Program funds combined) either way between the NHS and the Flexible Program. Of course, a state exercising this option should be required to inform FHWA of the transfer.

Interstate Program Transition

Although we recommend eliminating the Interstate Highway Program as a special program category, we recognize existing federal commitments to that program. For the National Highway System to function, the Interstate Highway System must be completed. An estimated $3 billion to $5 billion beyond current authorizations will be required to complete the designated Interstate System.

Therefore, we recommend a transitional Interstate Completion Program be continued as a separate category within the NHS. States which have completed their Interstate System should not be penalized in the apportionment of Interstate Completion funds.

Public Transportation

Oklahoma recommends that any increase in the public transportation program funding from the Mass Transit Account of the Highway Trust Fund be distributed to state and local governments by a new formula. Any increased funding should be distributed:

- One-half according to the current Section 9 formula, and
- One half based on that state's relative portion of the nation's population

Transportation Funding

Today, our transportation infrastructure is wearing out, and the cost of moving goods to markets threatens our economic competitiveness. Infrastructure investment needs in Oklahoma are staggering.

If we assume a cost of operation of 50¢ per mile, it costs $182,000 each year if 200 trucks a day are required to detour five miles around one structurally deficient bridge. If 2,000 cars must also take the detour each day, the cost is an additional $730,000 annually. And today, more than 240,000 of America's 575,000 highway bridges -- 12,000 in Oklahoma alone -- are structurally deficient and should be closed or restricted to light traffic, or are functionally obsolete.

Oklahoma agrees with AASHTO that the level of federal investment in highways and public transportation must be increased. However, we believe this increase in federal investment should not require an increase in federal highway user fees until five conditions are satisfied:

- Reaffirm the dedication of the receipts from current and future federal highway taxes and user fees to transportation purposes. We must keep "trust" in the Highway Trust Fund

- Make the full balance of the Highway Trust Fund (limited only by the anti-deficit provisions of the Byrd Amendment) available to the states for obligation. The U.S. General Accounting Office estimates that highway commitments could be increased by $7.4 billion without violating the Byrd Amendment

- Repeal the exemption of ethanol-blended gasohol and other alternative fuels from 6 cents of the current 9.1 cents per gallon federal excise tax on gasoline. This "free ride" for certain highway users costs the Highway Trust Fund $650 million in revenue in 1987, and more than $3 billion since 1979

- Improve the effectiveness of collection procedures for the federal motor fuel tax. Despite recent changes in the federal highway tax collection mechanism, the Highway Trust Fund continues to lose hundreds of millions of dollars each year through organized tax evasion and inadequate collection procedures

- Give states the opportunity to increase fuel and road user taxes at the state level to off-set the shortfall in transportation financing

Highways

If these steps are taken, federal funding for highways can be increased significantly for the next several years without raising the federal excise tax on motor fuels. Oklahoma endorses

AASHTO's recommendation that the federal highway program be increased from its current level -- approximately $13 billion annually -- to approximately $18 billion in fiscal year 1992.

At the $13 billion funding level, Oklahoma would receive approximately $218 million, an increase of about $27 million over FY 1990 funding levels. With AASHTO, we further recommend continued gradual increases to approximately $26 billion in fiscal year 1995.

Oklahoma would receive approximately $435 million, an increase of almost $244 million over FY 1990 funding levels. These increases -- until at least 1994 -- are available without new federal revenues.

Public Transportation

Although Oklahoma recommends that substantial federal financing for public transportation should continue, we do not support APTA's recommendation to increase the federal excise tax on motor fuels to fund public transportation.

The Bottom Line

Today, Americans enjoy the convenience and economic benefits of a transportation system second to none. This system was made possible largely through a long-standing cooperative partnership among federal, state and local governments.

Today's economic world is more competitive than ever. A safe, high-quality, highly efficient transportation network is needed if our state and nation are to remain competitive. Such a network is essential to the mobility of the American people and to their ability to ship American materials and products. These activities are basic to our quality of life.

Good transportation alone is not the only answer, but it is essential.

Our country now has a choice. We can work and plan our way into a successful future. But we must act quickly to meet the new transportation challenges of tomorrow. We must:

- Restructure the federal-state partnership and the current federal-aid program

- Revise the formulas through which federal funds are distributed to the states

- Increase the levels of transportation funding

Let's Get There, Oklahoma!

TESTIMONY OF
BRENT KITCHEN, AIRPORT'S DIRECTOR, TULSA AIRPORT AUTHORITY
SUBCOMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
TULSA AIRPORTS INFRASTRUCTURE NEEDS
AUGUST 30, 1990 - TULSA, OKLAHOMA

Tulsa has a proud aviation history that has created a major air transportation center and an aerospace industry that is the region's largest employer and greatest economic generator.

Tulsa International Airport (TUL) is classified as a medium hub airport having seven major airlines that serve over 3 million passengers annually from portions of four states (Eastern Oklahoma, Northwestern Arkansas, Southwest Missouri and Southeastern Kansas). In addition, four air freight airlines along with the passenger airlines carried 60,000 tons of air freight to and from TUL last year. Air Freight is the fastest growing segment of aviation in Tulsa with a growth rate of 20 to 30% per year.

A total of 52 aviation related business currently operate on TUL. These business provide 17,000 aerospace jobs having an annual payroll of over $1/2 billion. Tulsa's Aerospace Industries contribute nearly $3 billion annually to the region's economy. American Airlines is the state's largest private employor with their Maintenance & Engineering Center and their Sabre II Reservation System located on the airport. Both of these facilities are the largest and most modern of their kind in the free world. American continues to expand these major facilities as well as their accounting center in Tulsa. McDonnell Douglas and Rockwell have large Aerospace manufacturing facilities on the airport that are major contributors to the nation's aerospace and defense industries. Because of these industries and others, Tulsa has become a leader in the manufacture of spaceage composite materials and produces more flight simulators than any other city.

Jones/Riverside (RVS) is Tulsa's reliever airport and is the busiest airport in the state serving 500 based private and corporate aircraft. This airport has 23 aviation businesses including a major flight training school. Spartan School of Aeronautics has 600 flight students, as well as aircraft and avionic maintenance programs. The main runway at RVS will be extended later this year to accommodate general aviation jet aircraft. Federal matching funds make this project possible and we are anticipating the installation of an ILS by the FAA in 1991.

All this would not have been possible and cannot be sustained without continued funding commitments to improve our airports facilities. The Airports Capital Improvement Program identifies 21 projects totaling $150 million needed over the next 7 years. This program has two very large projects which include the construction of an additional air carrier runway and the acquisition of property for noise abatement and airport development purposes. TUL currently exceeds peak hour capacity during certain periods of the day and with just normal growth, (4%) annual capacity will be exceeded by 1997. The additional runway will have four major benefits: (1) increase capacity; (2) reduce noise levels to a compatible level for 3,000 persons in adjacent residential neighborhoods; (3) open up an additional 400 acres of prime developable industrial land located directly beside a major runway; and (4) reduce flooding on industrial lands on and off the airport.

In addition, the airport authority plans to conduct a site selection study for the second reliever airport and a downtown heliport/vertiport to accommodate the forecasted aviation demands of the Tulsa Metropolitan area.

These projects will not be constructed without a reliable funding source. It is for this reason that we commend you for recently passing the Federal Aviation Administration/Airport Improvement Program (FAA/AIP) reauthorization bill (H.R. 5170) and its Passenger Facility Charge (PFC) provisions for continued funding of necessary airport capital improvement projects. We are hopeful that the Senate will demonstrate the same leadership of providing the PFC provision as a local funding option and the spending down of the aviation trust fund surpluses for airport development needs.

I would also like to go on record in support of the FAA as the primary federal agency responsible for federal programs that relate to airports. The FAA, in my opinion, has performed exceptionally well over the years in assisting airport operations with safety, security, construction and funding programs. It is very important that this continuity of administrating federal programs be maintained.

Thank you for your consideration of these important issues.

TESTIMONY PRESENTED TO THE CHAIRMAN OF THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

THURSDAY, AUGUST 30, 1990

TULSA, OKLAHOMA

Prepared Statement of Donna Peters

TULSA COUNTY CAPITAL IMPROVEMENT PROGRAM/INFRASTRUCTURE NEEDS

PRESENTED BY THE

INDIAN NATIONS COUNCIL OF GOVERNMENTS

TULSA COUNTY CAPITAL IMPROVEMENT PROGRAM/INFRASTRUCTURE NEEDS

Introduction

Thank you for providing INCOG with the opportunity to testify. I represent the Indian Nation's Council of Governments (INCOG) which serves five counties and 44 local governments. The mission of INCOG is to provide local and regional planning, information, coordination, communication, implementation and management services to member governments and their constituent organizations through a voluntary assembly of area elected officials and their appointees, resulting in the enhancement of public and private decision-making capabilities and the solution of local and regional problems. Our budget is $2.4 million, and is comprised of 78% local, 19% federal, and 3% state funds.

You've heard from Mayor Randle about the City of Tulsa's capital improvement needs, and received testimony from other selected area mayors. Our comments will focus on counties, and though we will principally discuss Tulsa County, much of our testimony will apply to surrounding counties as well.

Demographics

Tulsa County is the central county in the five county Metropolitan Statistical Area (MSA), which has a population of approximately 750,000. Tulsa County has a population in excess of 500,000. Like many metropolitan areas, the Tulsa MSA has experienced rapid growth over the last two decades, particularly in our suburban communities and adjacent counties. Unlike many other metropolitan areas, our central city, Tulsa, has also continued to grow, although at a somewhat slower rate.

At present, Tulsa County is designated as a non-attainment area for the pollutant ozone. Through concerted state and local efforts, significant improvement to our air quality has been attained. In fact, Tulsa County has been in compliance with air quality standards for the past three consecutive years, and is in the process of being redesignated as an attainment area. This is vitally important to the city, county, and region for future economic development. Further comments related to the air quality issue will be made later in our remarks.

County Government Finances

Unlike cities, whose primary sources of revenues are sales tax or utility fees, Oklahoma counties must rely on property taxes for revenue. The primary financing mechanism for counties is a millage levy, which is limited by the Oklahoma constitution to 10 mills. Like most, if not all counties in Oklahoma, Tulsa County is currently at the 10 mill limit.

The millage from property taxes is used almost exclusively for operations, which is essential to sustain a minimal level of county administration. As a result, Tulsa County has virtually no source of funding for capital improvements.

Tulsa County's General Fund Budget has not been able to keep pace with inflation since the mid-1980s. The budget for FY'91 is lower than the FY'86 budget, and reflects a 5.5% reduction from FY'90. As a result, the continued provision of county services at past operational levels has been exceedingly difficult, if not impossible, to maintain. The county's ability to continue competitive salaries has also been seriously hampered, threatening the stability of county services and productivity.

Declining real estate values have resulted from the state's depressed economy, and occurred in the aftermath of the oil bust of the early 1980s. Because of this, the state legislature sought to provide assistance to counties by authorizing counties with populations under 300,000 to levy up to a 2% sales tax with a vote of the people. This enabling legislation, however, precludes the use of this revenue source for Tulsa and Oklahoma counties, the state's two largest.

As you can see, options for funding infrastructure by county government are limited, and especially for large urban counties such as Tulsa County.

Tulsa County Capital Improvement Program Process

Nonetheless, recognizing that prudent planning for and managing of public facilities avoids crises and major replacement costs, the Tulsa County Board of Commissioners approved the concept of a Capital Improvement Program (CIP) for Tulsa County in late fall of 1988.

Capital improvements programming is the tool for coordinating future capital development with annual financial budgeting. It provides policy makers with the needed information to make difficult decisions, especially in periods of scarce financial resources.

In the Tulsa County Capital Improvement Program, four entities are involved in developing the final inventory of needs: a Technical Advisory Committee, the Citizen Overview Committee, the Tulsa Metropolitan Area Planning Commission, and the Tulsa County Board of Commissioners.

Each entity serves a specific purpose in the process:

*The Technical Advisory Committee collects and ranks the list of proposed Capital Improvement Projects, develops the draft Capital Improvement Program and makes recommendations for funding sources.

*The Citizens Overview Committee monitors project implementation and prepares an annual progress report to be presented to the Board of County Commissioners.

*The Tulsa Metropolitan Area Planning Commission reviews each proposed project to ascertain compliance with the Comprehensive Plan, ranks the projects in accordance with the Comprehensive Plan, and coordinates project scheduling with the City of Tulsa's Capital Improvement Program projects.

*The Board of County Commissioners holds a public hearing which serves a twofold purpose: to receive the Annual Progress Report from the Citizens Overview Committee and to solicit further citizen input into the Capital Improvement Program process.

Tulsa County Capital Improvement Project Needs

In January, 1990, the Board of County Commissioners received a final list of capital improvement needs for Tulsa County.

The CIP process established three categories of need: Urgent, Essential and Deferrable. Urgent projects were those needed immediately in order to maintain current service levels or mitigate a danger to public health and safety. Essential projects were those which would correct a serious deficiency of adopted county service standards, and those that are legally required but not an immediate threat to public health and safety. Deferrable projects were those which are needed for ideal operation but which can be postponed without substantial harm to present services.

The most pressing need for the County is a new jail and related juvenile justice facility. The present county jail was built in the 1950s. Maximum capacity of the jail is 550 beds, based on state jail standards and a federal court order. The county population in 1950 was 251,686, or half of what it is today. Despite continued heavy reliance on alternatives to incarceration, the jail population is projected to reach 1,150 within the next 20 years.

In addition to the need for a larger county jail, County Commissioners identified a total of $77.9 million Urgent projects; $5.6 million Essential projects; and $4.6 million Deferrable projects, for a grand total of $88 million in capital improvement projects.

The major Urgent projects were for road improvements which totalled $54.6 million, followed by bridge rehabilitation ($16.7 million); a health clinic for near north Tulsa ($1.9 million); and improved garages ($1.7 million).

The major Essential projects were also for road improvements and totalled $3.4 million, followed by a health clinic for east Tulsa County ($1.3 million).

The major Deferrable project was for an upgrade of Tulsa County's data processing system, and totalled $1.6 million, followed by health clinics for north and south Tulsa County ($1.3 million each).

The Board of County Commissioners deferred action on the majority of these Capital Improvement Program recommendations until a source of funding could be identified. Tulsa County has not received any significant amount of funding for capital projects in ten years.

Financing Gaps

Historically, the major source of revenue for counties was General Revenue Sharing (GRS). At present, the only federal money available is limited Community Development Block Grant (CDBG) funds, which are made available through the state. Tulsa and other area counties have participated in the CDBG program to further economic development through improved infrastructure and loans to businesses, and by assisting rural water and sewer districts in meeting serious infrastructure needs. Federal transportation programs funded with the gasoline tax provide some financial assistance to counties for highways and bridge improvements. Since the demise of GRS funding in FY 1986-87, counties have been hard-pressed to finance capital improvement projects. Table 1 shows the historical trends for GRS funds received between 1972 and 1988 by Tulsa County. The funding level reached its highest in FY 1977-78 at $3.6 million. However, this level of funding declined to slightly over $2.0 million annually during the early 1980s until the program ended in FY 1986-87 when $.7 million was received by the County. The Office of the County Clerk estimates that the county traditionally used 60% of their GRS funds for capital improvements, and 40% for social programs. It should be noted that funding for capital improvement projects had ended approximately six years earlier, with GRS monies funding only social programs in the later program years. By policy, Tulsa County did not use GRS funds for operating expenses.

Table 2 lists the capital improvement projects for Tulsa County constructed between fiscal years 1984 and 1988, which had funding sources other than GRS. Cost of these projects totalled approximately $8.0 million. Combining the estimated GRS financing for capital improvement projects with other sources of financing during this period yields a gross estimate of $2.5 million expended annually for capital improvements.

As noted before, it is apparent that the current level of funding is insufficient to address the county's capital improvement needs. Some other means of financing must be found.

Issuing General Obligation (G.O.) Bonds is the classic method available to counties to finance capital improvement projects. By Oklahoma constitution, however, G.O. Bonds issued by county government must be approved by 60% of the voters. Cities, by contrast, are only required to obtain a simple majority of voter approval for public utility projects, including streets and bridges.

Tulsa County has attempted, without success, to use G.O. Bonds to finance needed jail improvements in recent years. In 1987, a jail bond issue garnered 57% voter approval; in 1989, a similar issue garnered 49% voter approval.

Creek and Osage County Capital Improvement Project Issues

Creek and Osage counties are experiencing a similar lack of funding resources. Further, they are not as advanced in the development of their Capital Improvement Program process because of their limited fiscal base.
A key economic issue for these counties is access to Corps of Engineers lakes (Kaw, Birch, Heyburn and Skiatook Reservoirs). Although some funds have been expended for public improvements to various lake areas, "getting from here to there" has been an obstacle. The increased demand by recreational users for access to Corps lakes is putting pressure on county roads and highways. This demand is consistent with one of the beneficial uses of Corps facilities for recreation as established by Congress. Further development of these recreation areas would necessitate access improvements to county roads.

In addition, the development of the Tallgrass Prairie National Preserve in Osage County, currently under consideration by the National Park Service, will place substantial access pressures on Osage County.

The 50,000+ acre preserve would be the only one of its kind in the nation and would consist of a tallgrass prairie ecosystem, embodying American Indian policy in Oklahoma, westward expansion, the cattlemen's empire, and development of the oil and gas industry. Co-existing activities might include camping, fishing, hunting, horse rides, wagon rides and food services.

Once developed, it is expected that the preserve would generate an initial average annual visitation of 300,000, and go up to 700,000 by the time full development is achieved.

Summary

New funding sources must be identified for future capital improvements. Improvements to public facilities and expansion of services will most likely have to be paid for by the same public that benefits from them. Continued deterioration of existing infrastructure, along with increasing demand for new facilities and additional services won't go away just because the public doesn't want to pay. The Federal government should assist local governments in addressing capital improvement needs.

For your consideration, we respectfully offer the following observations and recommendations.

Recommendations

*INCOG has closely followed the proposed Clean Air legislation, and we support efforts to enact a new Clean Air bill. We encourage the Conference Committee to resolve remaining differences in a timely fashion. Of particular concern to us in these deliberation is how "transitional areas" such as Tulsa County will be treated. It is our understanding, based on both the EPA and State Health Department analyses, that House language would leave us in a transitional status until 1992. We understand that the Senate language on transitional areas may be more favorable to areas such as Tulsa, and we would encourage adoption of the Senate language. Achieving redesignation at the earliest possible date, rather than waiting until 1992, is of critical importance to economic development efforts in our region.

*We also believe that it is important that the "conformity" determination in the Clean Air Bill involving transportation be done on an overall program or plan basis rather than on a project-by-project basis. As a result, we strongly support the House language which we believe addresses this issue. Further, we urge that plan or project approvals involving transportation projects should be accomplished through a collaborative process involving both the Department of Transportation and the Environmental Protection Agency.

*We would also encourage retention of flexibility in the use of CDBG monies, without tighter targeting requirements as proposed by the Administration. Retaining existing flexibility in the CDBG program is necessary to meet the most crucial community development needs and clearly focuses resources on meeting needs of low and moderate income persons.

*In deliberations regarding future surface transportation legislation, we urge that consideration be given to addressing problems of mobility, not just between suburbs and inner city, but to meet the future transportation needs involving suburban cities and outlying activity centers.

*We think it is also appropriate to consider an increase in the federal gasoline tax which would address energy conservation demands as well as reduce the federal deficit. Additional funds generated should be used for transportation programs to the maximum extent possible, and to meet other infrastructure needs. Future consideration should be given to direct pass-through of funds to central cities and urban counties in the form of transportation block grants.

*Continued funding for area-wide water and air quality programs is also important. We would urge Congressional consideration for pass-through provisions for Section 604(b) funding for water quality planning programs similar to that provided in Section 205(j) of the Clean Water Act. We understand that your committee will be considering this issue and we would be happy to offer more specific information and recommendations at a later date.

*Finally, we also encourage the Federal government to look seriously at supporting regional planning efforts and promoting cooperation among local governments. The issue of solid waste and drug enforcement planning and program implementation comes to mind in this area.

We appreciate your interest in hearing about issues of concern to the Tulsa area. We would be happy to provide any additional information that you may need.

Infrastructure Field Hearing
Campbell City Council Building
August 30, 1990

PANEL IV - Waterway Needs

Testimony of Robert W. Portiss

Mr. Chairman and other distinguished members of the Public Works and Transportation Committee, my name is Robert W. Portiss. I am employed by and report to the City of Tulsa-Rogers County Port Authority, as their Port Director for the Tulsa Port of Catoosa. On behalf of our Board and staff, I am very honored to have an opportunity to present testimony at this, your Infrastructure Field Hearing.

The Port is owned by the citizens of the City of Tulsa and Rogers County who, in the late 1960's, collectively invested $21.2 million in general obligation bonds to acquire 2,000 acres of land and to construct the initial infrastructure necessary to begin operation of its river port.

This major investment was made, in part, to fulfill our metropolitan area's commitment to provide a public port in return for the federal government's construction of the 445-mile long McClellan-Kerr Arkansas River Navigation System at a cost of $1.2 billion.

Located at the head of navigation for this waterway, the now twenty year old Tulsa Port of Catoosa has 45 industrial facilities on-site employing approximately 1,400 people whose combined annual payroll exceeds $25 million. Total public investment now stands at $26 million and total private investment at $165 million.

The Port offers cargo handling and distribution services by rail, trucks and barge with air afforded through the Tulsa International Airport located a mere seven (7) miles away.

As a result, the Port has evolved into a regional manufacturing and distribution center having handled 24 million tons of cargo in 16,000 barges since opening for business in December, 1970. Much of this cargo has either been shipped to or received from areas as far north as North Dakota.

Equally impressive as the Port itself is the greater then eight percent (8%) return on investment to our Nation from the multi-purpose McClellan-Kerr project due, in part, for the flood control protection provided by the three large reservoirs (Eufaula, Oologah, and Keystone) constructed as part of this project together with navigation, recreation, municipal water and wildlife conservation benefits.

Unfortunately, however, greater benefits will not be forthcoming unless the Federal Government constructs Montgomery Point Lock and Dam in the entrance channel to the McClellan-Kerr. In fact, without this structure, barge navigation will cease since, as the U. S. Army Corps of Engineers has officially documented, the surface elevation of the Mississippi River is projected to drop fifteen (15) feet over the next thirty (30) years, a distance equal to the current depth of the White River entrance channel. It would simply be ludicrous for the Congress to allow that to happen! Not only would a substantial portion of a national investment be lost, but so would the hundreds of millions of dollars invested in private industrial and barge terminal facilities along our Waterway.

I realize that in many respects these remarks could be construed as "preaching to the choir" since your Public Works and Transportation Committee is already supporting this project as evidenced by Chairman Anderson's statement before the Congress clarifying for the record that Montgomery Point Lock and Dam was in fact originally authorized in 1946 as part of the then approved multi-purpose Arkansas River Navigation Project. Nevertheless, we must continue to repeat the information in hopes that the entire Congress will soon appreciate the critical need for Montgomery Point Lock and Dam and therefore approve the approximate $163 million for its construction. Thusfar, as of August 1990, in addition to your invaluable assistance, the House Energy and Water Subcommittee has submitted and received approval by the entire House for a $1 million appropriation for the 165 acre land acquisition portion of this project. We are now working towards similar approvals in the Senate. With the Corps feasibility report to be released shortly, we are hopeful the Senate will endorse this $1 million start and be receptive to approval of construction monies the next fiscal year.

Thank you for your interest and ongoing assistance. Special thanks is also extended to Congressman Jim Inhofe for affording us this opportunity to testify before this important Congressional Committee.

STATEMENT OF RODGER A. RANDLE
MAYOR OF THE CITY OF TULSA, OKLAHOMA

TO: Committee on Public Works and Transportation
United States House of Representatives
Congressman Glenn Anderson, Chairman

FOR: Hearing on Infrastructure Needs
Tulsa, Oklahoma
Thursday, August 30, 1990

Thank you for this opportunity to appear before your committee and discuss our urgent needs relating to the infrastructure.

As you know, the health and welfare of a city depends in large measure on these infrastructure systems -- water and sewer lines, storm sewers, streets and sidewalks, solid waste incinerators, and the like. In many cases these systems are hidden, and we all take them for granted until they fail.

The City of Tulsa faces a tremendous backlog of unmet needs relating to infrastructure capital replacement, expansion, maintenance, and operation. We are still cataloging specific projects, but our needs over the next decade or so clearly top $1.6 billion -- or, for our city of 360,000 residents, somewhere around $4,500 for every man, woman and child.

I'd like to briefly touch on three areas today:

1. Some of our local infrastructure goals, programs, and priorities.
2. Our local sources of funds for infrastructure.
3. Some of the urgent constraints that prevent us from meeting our infrastructure needs.

1. INFRASTRUCTURE GOALS AND NEEDS

I would like to submit to you two documents we have recently prepared that include information that may be helpful to you:

-- A summary of Tulsa's five-year capital plan, covering the years 1991-1995, that includes a list of $1.6 billion in capital projects needed in our community. Nearly all those projects relate directly to our infrastructure. That list does not, however, include most of our operating and maintenance needs relating to our infrastructure. It does not include many facilities that have become functionally obsolete and need to be replaced. It also does not include some projects recently identified to meet federal requirements in the Clean Water Act and the Safe Drinking Water Act.

-- I also am submitting our most recent proposal to finance part of those needs. This report summarizes our recommendations for an extension of our five-year, extra penny sales tax, earmarked for capital needs. This report is currently under consideration by Tulsa's City Council, and we recommend the package be submitted to voters December 4, 1990. If approved, this temporary tax could provide more than $200 million for capital improvements, replacement, and maintenance, nearly all in the category of infrastructure.

Our goals in infrastructure management include:

A. Operation and maintenance to keep the systems operating at current capacity, to prolong useful life, and to protect our investment.

-- We estimate, for example, that our 4,000 lane-miles of streets constitute a $4 billion asset, one which needs improved maintenance. But our studies, still underway, indicate that 44 percent of our major streets need to be resurfaced, and 3% need to be completely replaced. If we delay maintenance, deterioration accelerates, and costs spiral upward rapidly. If we delay even two years, for example, we will need to resurface 53% of those streets and to totally replace 11%. Our present backlog of street maintenance is estimated to be $60 million. If we wait two years with no increase in street maintenance funding, our backlog cost will increase by 40 to 50 percent.

-- As another example, portions of our City Hall complex have literally fallen in, at sites where the Civic Center plaza has deteriorated badly; we are completing major maintenance work, but more of the plaza deck needs to be completely removed.

B. Protect citizens' health, safety, and welfare.

-- We estimate, for example, that we urgently need $160 million in additional capital funds for flood control works -- in addition to the $165 million Mingo Creek flood control project now being constructed through a partnership between the city and the U.S. Army Corps of Engineers.

-- We have yet to try to calculate costs to replace and repair the city's stormwater sewer system. About 100 times a year, we experience storm sewer cave-ins -- including lines that give way beneath our street system.

C. Replace functionally obsolete facilities and expand overloaded facilities to catch up with growth.

-- For example, we need to widen at least 86 miles of arterial streets that are currently overloaded -- many of them operating far beyond capacity.

-- We have just received a recommendation to replace our 60-year-old Mohawk Water Treatment Plant, for a cost estimated at roughly $45 million, as another example.

D. Comply with federal and state mandates.

-- In our wastewater systems, we need to spend $95 million over the coming five years -- just to meet existing and pending administrative orders and consent orders.

-- In addition, we know we need to spend more than $15 million to upgrade water treatment facilities to meet the 1986 amendments to the federal Safe Drinking Water Act. We anticipate that these lists of needs will grow significantly as the federal requirements are defined in future years.

-- We cannot yet anticipate what costs may be required to meet the new requirements for stormwater quality or to meet clean air regulations.

2. INFRASTRUCTURE FUNDING

Tulsa has committed a major share of its available resources to protecting and providing for its infrastructure. For example:

-- Since 1977, we have allocated more than $1 billion to construction of capital projects, nearly all infrastructure projects. This total includes $400 million in capital sales tax funds. We currently have more than $475 million outstanding in revenue bonds -- to be repaid from users of the systems -- and nearly $160 million in outstanding general obligation bonds, to be repaid by property taxes.

- We have added a $2 monthly fee to utility bills for stormwater management. Most of that fee goes toward flood control and infrastructure management.

- In the past decade, water, wastewater, and refuse bills have risen from 70% to 379% (depending on service and user category). The end is not in sight.

- We have reorganized our management systems to trim costs wherever possible, including organization of a new Public Works Department charged with managing most infrastructure systems.

In short, Tulsans have spent significant amounts of their money over the past decade to improve our infrastructure management. But the needs continue to exceed our ability to finance them. And we have a few if any additional sources to tap.

3. PROBLEMS AND CONSTRAINTS

In addition to fund shortages, several problems constrain our ability to meet these infrastructure needs. For example:

A. Federal regulations that are uniform for the entire country are sometimes too inflexible for our community.

- For example, we fully support improving water quality and believe we are working ahead of most communities in identifying and addressing stormwater quality issues. But inflexible requirements that might require stormwater treatment would be a disaster; such a requirement could literally bankrupt Tulsa and many other communities.

- We fully support recycling of solid waste, and other systems to reduce solid-waste pollution. That is one of the principal reasons Tulsa built a multi-million dollar mass burn plant, where our community's solid waste is reduced by 90 percent before disposal of the ash in landfills. But market problems relating to the sale of steam, compounded by other issues, keep the incinerator operation in delicate balance. A blanket federal requirement that we recycle 25 percent of our solid waste before it reaches the plant -- without any consideration for local conditions -- could prove remarkably costly to our citizens, who are already paying among the highest solid waste rates in the Midwest.

B. Federal requirements that require massive local funds -- without any outside assistance -- must supersede any local priorities.

-- For example, the $95 million we need for wastewater projects just to comply with existing law -- must be our first priority infrastructure projects. We must fund those projects, even if it means that streets go unpaved, and storm sewers collapse.

-- Our problems have mounted with the recent loss of the federal wastewater grant program and reductions in community block grant funds.

C. Federal tax systems require us to send funds to Washington that far exceed our return for specific programs.

-- For example, Oklahoma is a "donor state" in transportation funding. For example, in fiscal 1988 Oklahomans contributed $17,313,311 into the federal Mass Transit Account of the Highway Trust Fund. During that same period, Oklahoma received only $910,132 from that account -- .05% of our contributions.

D. The federal government, while placing increasing pressure on cities to meet environmental mandates, has eliminated many of our traditional sources of revenue.

-- Two traditional revenue sources that no longer exist are: sales tax exemptions on federal tax returns; ability to arbitrage.

In connection with these constraints, we would take this opportunity to urge your support for HR 5423 introduced by Representative Beryl F. Anthony (Arkansas). This bill provides relief for tax exempt bond issuers from the administrative burdens and complexity imposed by the Tax Reform Act of 1986. This intrusion by the federal government has placed an increasing financial burden on state and local governments in that it has made the cost of borrowing more expensive with these complex federal income tax rules. In fact, so much attention has been drawn to the flaws in the regulations that both the Ways and Means Tax staff and the staff of the Joint Committee on Taxation recently recommended that enforcement of the regulations be suspended. Representative Anthony's bill would provide this much needed relief.

CONCLUSION

In conclusion, I appreciate the opportunity to discuss some of these problems with you today, and we will be pleased to assist your committee's work in any possible way.

I hope you will keep us in mind as you proceed with your deliberations. We welcome opportunities to work in partnership with the federal government, as we are doing so well with the Corps of Engineers on the Mingo Creek flood control project. Do what you can to relieve our tax burdens and to help us provide the infrastructure facilities our citizens need and deserve. Please call on us again if we can provide additional information, and I hope you enjoy your stay in Tulsa.

Prepared Statement of Col. F. Lee Smith

Mr. Chairman and Members of the Committee.

It is a pleasure to be with you today and participate in your hearing as a representative of the Tulsa District, U.S. Army Corps of Engineers. Throughout our Nation's history, the Corps has actively participated in planning, designing, constructing, and operating and maintaining important aspects of our Nation's infrastructure. The Corps supports your Committee's focus as most appropriate.

I am fortunate to be a Commander of a U.S. Army Corps of Engineers' District which has served Oklahoma with great distinction for many years. A premier feature of this involvement has been the Oklahoma portion of the 17 locks and 4 hydropower facilities on the McClellan-Kerr Arkansas River Navigation System. Were it not for the Federal participation through the Corps in this navigation system, the waterborne commerce which has proven to be clearly in the benefit of the total Nation would not have been possible in this region of the country.

Another premier portion of the Corps' contribution to the economic well-being of this part of the country has been in the area of flood control. Historically, this region has been victimized by flooding costing lives and imposing severe adverse economic impact. An example of our most recent ongoing involvement in flood control is our successful partnership with the city of Tulsa. Through this cooperative approach, the citizens of Tulsa will soon see a substantial reduction to the devastating flooding caused by Mingo Creek. In 1984 alone, four lives were lost and some $124 million damages were incurred by flooding in the basin. When completed in 1995, some 23 flood water detention facilities on nearly 700 acres and over 10 miles of improved channels will be in place and provide a 100-year frequency flood protection. This important $186 million investment is estimated to accrue benefits averaging over $32 million per year when completed.

Another important aspect of infrastructure associated with flood control is our local Tulsa-West Tulsa levee. This system currently provides flood protection on the Arkansas River to property valued in excess of $1.2 billion. The Federal money spent in 1945 to construct this levee system has proven many times over to have been money well spent. Though this project is nearing the end of its programmed economic life, the levees have the potential for many more years of service. However, these levees need rehabilitation beyond that envisioned originally by the local sponsor. This need for rehabilitation remains a source of concern since the 1986 flood on the Arkansas River clearly demonstrated the need for these levees.

In closing, I would like to emphasize the longstanding commitment of the U.S. Army Corps of Engineers to the wise management of our Nation's resources. As we look to the future, the challenges are many, and the need to prioritize funding for water resources will be as important as ever.

The Corps' longstanding involvement in providing the Nation's infrastructure has generated expertise and accountability to the Nation which has withstood the test of time. Our benefit-to-cost methodology has proved to be a dependable indicator of sound Federal economic investments. The Corps' use of Federal and local cost-sharing partnerships has produced outstanding participation with communities not only here in Oklahoma but throughout the Nation as well. Our efforts in environmental enhancement and recreation as well as hazardous and toxic waste cleanup have established the Corps of Engineers as the best public engineering agency in the world. The Corps looks forward to continued service as the Nation addresses its infrastructure challenges today and tomorrow.

I thank you for the opportunity to address this Committee this afternoon and would be pleased to respond to any questions you may have.

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

FRIDAY, AUGUST 31, 1990

House of Representatives,
Committee on Public Works and Transportation,
Springfield, MO.

The committee met, pursuant to call, at 9 a.m., in the Ballroom, Findlay Student Center, Drury College, 900 N. Benton, Springfield, Missouri; Hon. Glenn M. Anderson (chairman of the committee) presiding.

Present: Representatives Anderson, Laughlin, Hammerschmidt, Hancock, Emerson and Inhofe.

The Chairman. Good morning. The Committee on Public Works and Transportation hearing on the future of our Nation's infrastructure needs will come to order. It is my pleasure to welcome you here today and to thank you for taking time from your busy schedules to share with us your thoughts on this important subject.

For several months now, our Committee has been examining many aspects of the infrastructure issue seeking a better understanding about our Nation's public works crisis. We have explored emerging infrastructure needs from the national perspective and reviewed the impact of infrastructure needs on private sector investments and on the ability of the United States to compete in international markets. We plan to also look at infrastructure financing alternatives and new technologies.

It is important, however, that we understand what kind of infrastructure problems are being experienced at the local levels. And so, we have embarked on a series of hearings at various sites around the Nation to talk with people most directly involved and to get a broad range of ideas and suggestions that can help to resolve some of the problems.

And, I am pleased to be here in Mel Hancock's district, and I want to thank him and the people of the 7th District for their generous hospitality. And Mel has, of course, been the driving force behind this hearing, and I am pleased to be here at his urging to explore the future of our Nation's infrastructure and its effect on southwest Missouri and areas like it. Mel has worked very hard to make this event possible. He has been a great credit to the Committee over the past two years just in his first term. He has provided valuable input from his background in business and as a private citizen. I am proud and pleased to have him as a member of the Committee. And again, it is a pleasure to conduct this hearing in

Missouri's 7th District so the Committee can have the benefits of the testimony of the fine witnesses we will be hearing from shortly.

I am also pleased that we have with us four other members of our Committee: Congressman John Paul Hammerschmidt of Arkansas and the Committee's ranking Republican member and one of the real leaders in Congress on the infrastructure issue; Congressman Greg Laughlin of Texas, who also hosted an infrastructure hearing in his district; Congressman Jim Inhofe of Oklahoma, in whose district we were yesterday to receive some excellent testimony on local infrastructure needs; and Congressman Bill Emerson, also a member of the Missouri delegation. I am glad all these members could join us today.

As we all know, when we speak about infrastructure, we are speaking about the very cornerstone of our cities and rural communities. Inadequate infrastructure weakens our economic foundations, threatens the health and safety of us all and jeopardizes our future standard of living and the quality of life we have come to enjoy.

When addressing the importance of infrastructure, we should also note that recent economic research shows a link between the level of public investment in the Nation's infrastructure and productivity and profitability in the private sector. The United States productivity growth rate fell from 1.8 percent annually in the 1960s to less than one percent, or just $\frac{7}{10}$ths of a percent, in the early 1980s, while during the same period the annual growth rate of spending for infrastructure fell from 4½ percent to again less than one percent, or $\frac{8}{10}$ths of a percent. Productivity in our country is growing much slower than in other developed nations, such as Japan, West Germany, Canada, France, Italy and the United Kingdom—our economic competitors—some of which invest almost five times as much in their public works as does the United States. We, in fact, rank 55th in the world in infrastructure investment.

And because of this, we are continuing our inquiry and look to you to help us gain further insight into our infrastructure needs. Our question today is: What is the condition of the infrastructure in Missouri, particularly this region of the state? Is your network of public facilities—your roads, bridges, public buildings, sewers and waste water treatment plants, water supply facilities and other basic services—are they adequate to meet current and anticipated needs of the area?

We look forward to today's hearing to answer these and other questions. And now, I would like to recognize other members for any opening remarks they wish to make. Let me recognize Congressman John Paul Hammerschmidt, Congressmen Laughlin, Inhofe and Emerson, in that order. And then conclude with our host, Congressman Mel Hancock. So, John Paul, it is yours.

Mr. HAMMERSCHMIDT. Thank you very much, Mr. Chairman. I am delighted to be here with you in Missouri's 7th District to address a great concern facing this nation—the rebuilding of America's infrastructure. As we all know, the United States must meet its infrastructure needs if we are to remain competitive in the global marketplace. You have just given those dramatic figures on where we stand in the world order on infrastructure.

Our nation's basic public facilities are crumbling. More than 40 percent of our nation's bridges are in disrepair or are functionally obsolete. Highways and airports are gripped with congestion. Many areas of the nation have inadequate water supply or flood control projects.

So, I commend you, Chairman Anderson, for your leadership in infrastructure and for scheduling these and other hearings around the country so that we may identify and meet the infrastructure needs that face this nation.

I would also like to commend Mel Hancock for his work in organizing this hearing. If it was not for Mel, we would not be having this hearing here today. At his urging, we have brought the Committee here to help identify the infrastructure needs in this area of the country. And, his efforts in Congress to spotlight the needs of southwest Missouri are admirable and will certainly have a major impact on legislations we write in the future. His constituents should be proud of these efforts and of his commitment to bring to Congress the common sense, conservative ideas which best represent this region.

Although Mel is in his first term in office, he has been a very effective member of Congress. He has played an integral part in planning the continued improvement and upgrading of Highway 71, which runs through both of our districts. And, this highway is very important to the economic viability of southwest Missouri, and I know that he is working diligently to continue improvements along this thoroughfare.

So, I look forward to working with Mel on other projects in the future. I am delighted to be here today to hear the witnesses discuss the needs of this area.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you, John Paul.

Mr. LAUGHLIN. Thank you, Mr. Chairman. I join in the comments that you and the ranking Republican, the Honorable John Paul Hammerschmidt from Arkansas, have stated.

I am proud to be in Mel Hancock's district. Mel and I are freshmen on this Committee together, and I admire the manner in which he goes about representing his district.

I am pleased to join him in his district for the first time because he has been to the 14th Congressional District of Texas, the district I represent, on two occasions. We had a water resources hearing last year, and earlier this month, we had an infrastructure hearing. And on both occasions, Mel was a very important participant in the success of those two hearings.

Yesterday, we were in Jim Inhofe's district over in Tulsa. And, going through that hearing, I am now learning in the first term of office that these infrastructure problems in Texas and Oklahoma and Missouri, they are not Democrat or Republican problems; they are American problems. And I am pleased to be a part of a Committee that takes the approach that these are American problems. And so, we look forward to hearing the testimony and the evidence in support of these continuing national infrastructure problems that you are faced with in southern Missouri.

I am also pleased to recognize our good friend, Bill Emerson, having a role in this hearing. As Mel pointed out to me in Texas at my hearing, he and Bill Emerson are both conservative, and that is the reason they are both having their hearing at one time—to conserve the energy and expenses. Well, I admire that because that is my same philosophy. So Bill, we look forward to hearing from your constituents who took the time and effort to travel over from your district to give important information to this serious national problem.

Thank you very much, Mr. Chairman.

The CHAIRMAN. Thank you, Greg.

Congressman Jim Inhofe.

Mr. INHOFE. Thank you, Mr. Chairman.

First of all, let me just echo what they said. We are very, very glad to be here. I did not come quite as far as some of the rest of them. I am from Tulsa, Oklahoma. And, I have enjoyed very much serving with Mel Hancock. We happen to be on the same subcommittees together, and my background is in aviation, so we have—he has an intense interest in that. I believe that it is a very important industry. Certainly, in Tulsa, Oklahoma, it is our largest employer—aviation. So, it is something that I know affects you folks here.

When I was coming over this morning, I flew my plane over from Tulsa, and as I landed and was going to be met to come down here, there is a lot of confusion because there is so much new construction on your airport. You have your new general aviation terminal facility. And I am not sure that the ground control knew exactly where it was it is so new. So, I know that things are growing here in this area.

I served a number of years as Mayor of the City of Tulsa. And it seemed to me—and even, I felt this way when I went into that job in the late 1970s—that most of the infrastructure problems were in the industrialized east and west or in the older part of nation. I found out when I became Mayor of Tulsa that some of the major problems are in the new frontier, as we refer to it. That the infrastructure problems of the major metropolitan areas and industrialized east have been addressed for a long period of time, but we have kind of been forgotten out here in our part of the country. And yet, at that time, the City of Tulsa was rotting from within in its water system, its sewer systems, its roads, its streets, and we had to rebuild a city during the three terms that I was Mayor of the City of Tulsa. And this is a recognition that certainly our Chairman, Chairman Anderson, understands—he is from California—but, he knows and is sensitive to the problems that we have here.

Now, just look at this panel up here. You have represented here Texas, Arkansas, Missouri and Oklahoma. And our Chairman was sensitive enough to our needs to bring us together to have this Committee hearing—these Committee hearings right in this region. So, I think that is a very significant thing. And, these hearings are important because you can read about and you can get reports in Congress. You can sit in a Committee meeting in the Rayburn office building in Washington. But, until you have been here and touched it and seen it, you do not really have a full grasp for it.

I think a good example—yesterday, when we went to our navigation way in the Port of Tulsa, Greg Laughlin, who has six counties on the intercoastal waterway down in Texas—I do not think he was really fully aware of our navigability in Tulsa, Oklahoma until he was up there and had seen it. And so, this is very significant that this Committee that is unilaterally the Committee that makes the decision as to where the emphasis of infrastructural money should be spent is right here in Springfield, Missouri in Mel Hancock's district. And as a member of this Committee, I am really delighted to be here.

Mr. HAMMERSCHMIDT. Mr. Chairman.

The CHAIRMAN. John Paul.

Mr. HAMMERSCHMIDT. Could I—would you yield to me out of order just for a moment? In my enthusiasm of being here and recognizing Mel Hancock, I forgot all about my dear friend Bill Emerson down here, and I just wanted to say how—what a great job he does in our Committee and in the Congress for his district in Missouri, and I wanted to apologize to Bill. I just did not recognize seeing you sitting down there, and I wanted to say that Bill is one of the most valuable members of our Public Works Committee. Thank you.

The CHAIRMAN. On that, we will recognize Congressman Bill Emerson.

Mr. EMERSON. Thank you, Mr. Chairman. I am delighted to welcome you here to Missouri today John Paul and our other colleagues and to thank Mel for his arranging this hearing. I am just delighted to see all of you here in southern Missouri. It is good to have you here, and we do have a lot of important things to talk about.

I really cannot emphasize enough how important the topic of infrastructure is, not only to Missourians, but to all of us. A community cannot grow and prosper without a majority of the basic structures needed to service the people who live and work there. Good transportation networks are a very, very crucial element. Good roads, good bridges, protection and control of our water resources and other basic services are all a part of a community's basic infrastructure needs. Fulfilling these needs encourages existing businesses and industries to expand. And in turn, new and expanded industries translates into more jobs. And of course, all of this results in a stronger, healthier economy overall.

Specifically, Missouri holds the unfortunate distinction of having the most deficient bridges in the country. The Missouri Department of Highways and Transportation, with their outstanding leadership—which is well represented here today—is working very, very hard to meet the tremendous needs we have. But, the financial resources are simply not available to remove ourselves from the top of this list. And I am hopeful that as our Committee reviews ways to finance our infrastructure needs, a special program might be developed to help states replace or repair our deficient bridges in cases where the needs simply outweigh the available resources.

Also, I want to make a particular point, Mr. Chairman and colleagues, that my Congressional District, which is right next door to Mr. Hancock's district on the east, has tremendous highway and transportation needs. While we have some good north/south corridors over on the eastern portion of the district, we are very sadly lacking on the western edge and we are particularly lacking in good east/west routes. We are working very hard in Missouri to see that these east/west corridors are improved, and this includes such projects as the proposal for Interstate 66, for U.S. Highway 60, which could prove to be vital transportation links connecting my Congressional District with both the east and the west coasts. Improvements are also very necessary on U.S. Highway 63, which basically dissects our state from north to south.

Now, in addition to these tremendous highway and transportation needs, the 8th Congressional District faces some rather unique infrastructure problems that much of the rest of the nation may not be aware of, and that is the controlling the waters of the Mississippi River. The mighty Mississippi drains almost half of the water in this nation. It drains from as far away as mountains in western Maryland and all the way out to the eastern slopes of the Rockies in Idaho and it carries all the water that lies in between down to the Gulf of Mexico. These communities, which border more than 300 miles of the shoreline—Mississippi shoreline—in my District have tremendous flood control problems, as well as potential wetlands designation problems that we, as a nation, cannot afford to overlook and we must not—certainly as a Congressional Committee—we must not inflict upon them unworkable regulations. It is very important that we ensure that what regulations are going to come down through the Transportation Committee where we are the source, that they be workable and understandable and truly applicable to the region to which they are intended to apply.

Now, that is a brief statement, Mr. Chairman. I look forward to hearing from our witnesses, who will elucidate here as the morning goes on. Thank you very much.

The **CHAIRMAN**. Congressman Mel Hancock.

Mr. **HANCOCK**. Thank you very much, Mr. Chairman. The first thing I would like to say and point out to this panel and to the Chairman is that an awful lot of the people in this audience are private citizens that are concerned about the Government, and about the growth of Government, and about the infrastructure. I know you have held hearings all over the United States, and I have been to several. And I am going to guess that there are probably more concerned private citizens in this audience than at any hearing I have attended. And I think this speaks real well for the 7th District, and I am sure that this Committee will remember that when they get back to Washington.

Needless to say, I am bragging on the people in the 7th District, and I hope everybody understands that. It is the greatest district in the country.

It is indeed a pleasure for me to welcome Chairman Glenn Anderson, ranking Republican John Paul Hammerschmidt and Congressmen Bill Emerson, Jim Inhofe and Greg Laughlin to Springfield so we can continue to work on this Committee to explore and examine the future needs of the nation's infrastructure. The 7th District is an excellent choice of location in which to investigate this matter. This area is indeed the crossroads of America, and its future needs are great, as well as representative of the challenges we face in maintaining an infrastructure that can support a growing population and spur on economic growth.

We will hear testimony today concerning the impact infrastructure has on governments, businesses, tourism and recreation. Combined, these interests represent the economic backbone of this region. I am sure that it will be expressed repeatedly that without a properly maintained infrastructure, this region will suffer.

Despite this message and Missouri's importance to interstate commerce, according to statistics compiled by the Rebuild America Coalition, 25 percent of 1,138 miles of urban highways and streets are rated deficient under the Federal Highway Administration pavement condition rating system, and 12 percent, or 3,671 miles, of all paved rural highway miles are rated the same. Of the 23,415 bridges in Missouri, 12,015, or 62 percent, are either structurally deficient or functionally obsolete.

Other infrastructure needs are great as well. Capital needs to improve Missouri's airports will be over $231 million between 1991 and 1995. And, it will cost over $300 million over the next five years to bring Missouri into compliance with water quality standards mandated by the Clean Water Act.

Closer to home, many projects need to be constructed and others need improvements. Highway 71, just west of us, if brought up to interstate standards, would provide the much needed north/south corridor through the Midwest. If Highway 60 were upgraded further, it would become the main expressway between Interstate 44 and Interstate 55. And if Highway 13 could be expanded, it would provide this area with a decent road to Kansas City. Through this Committee, I will be working to ensure that these projects are constructed.

These are examples, however, of only one state's needs. Multiplied fifty-fold, rebuilding America will be a major task.

But unlike other government programs, infrastructure spending is an investment in our future, and its benefits are spread throughout the country. For those same reasons, it is also one of the most clear-cut proper functions of government around. That is why this conservative Congressman is more than happy to get government in gear for these projects.

I look forward to hearing from my fellow Missourians today concerning the needs and benefits of southwest Missouri's infrastructure. I am sure that the Committee will leave here with a better understanding of the problems we face and the needs that must be met.

Thank you again, Mr. Chairman, for bringing this Committee to southwest Missouri to discuss this important topic.

Mr. CHAIRMAN. Thank you, Mel.

Because so many people have been willing to participate in this hearing and because of time constraints, I am going to ask each witness to summarize his statement orally in two or three minutes. But each witness' full statement will be printed in its entirety in the record of the hearing.

And now I want to call our first panel of witnesses. They are Mr. Wayne Muri, Chief Engineer of the Missouri Highways & Transportation Department, and the Honorable John T. Russell of the Missouri Senate representing District 33.

You might go in that order. Mr. Muri, you first.

TESTIMONY OF WAYNE MURI, CHIEF ENGINEER, MISSOURI HIGHWAYS & TRANSPORTATION AND HON. JOHN T. RUSSELL, MISSOURI SENATE, DISTRICT 33

Mr. MURI. Mr. Chairman, Congressional members. My name is Wayne Muri, Chief Administrative Officer for the Missouri Highway and Transportation Department. Thank you very much for coming. I know how much you run on the fast track. It is very impressive that you have come to Missouri to do this, and I want you to know we very much appreciate that.

Chairman Anderson, I do want to mention. Thanks for the chance to come before you again. I recently testified for before you on fuel tax evasion, so thank you for the chance to be here again.

I want to wear three hats, and I will speak very quickly. Yes, I am with the Missouri Highway & Transportation Department. I am also Chairman of the Transportation Research Board and also Chairman of the Association of State Highway Officials, an implementation group for the future highway and transportation program. So, I will touch on all three.

First, on the Transportation Research Board, I want to echo something that you have said this morning and said several times. On that Board, I serve on the National Research Council and also the Council of the National Academy of Science. I just came from a meeting. The Department of Commerce was there, the Secretary was there. And what he had to say about where we are in the world competition and where we are heading was the most sobering testimony and presentation I have ever heard. So, we understand clearly what you are saying.

Second, on the Transportation Research Board, we recently held a major hearing and special session on what does make this country competitive and what are Japan and European countries doing. And I can tell you—and you alluded to that—that is very, very sobering also. If you look at where we are today and where we are heading and projecting tomorrow, some changes have to be made. We very appreciate what you are saying.

In Missouri, we have a lot at stake, and we think very much that we are at the crossroads and there has never been a more critical time for transportation. And thank goodness, we are in your hands. We think we are in good hands at a most critical time. To say we have a great stake in this country is true. But to say we have a stake in transportation in Missouri is super critical.

Mr. Chairman, you have something in California we do not have. You are near the coast. We have a lot of things going for us here in Missouri. But, to be competitive nation and global-wise, it takes a lot of transportation for Missouri. So, it is very, very critical to us.

Let me just mention where we are. In Missouri—and as Congressman Emerson and Congressman Hancock mentioned—we do have some needs. To give you some numbers, $5.8 billion worth of needs in the next ten years just to hang on to Missouri and keep what we have. That is about $580 million a year of extra investments that must be made. It is clear in any way that we are going to meet that kind of investment, we must have help from the Federal Government through a better federal program. We also recognize that we are going to have to raise funds at the state level. But the point here is, we must have help at the federal level or we will never make it. There is no question about that, in our opinion.

What we are looking for is something very simple. Number one, is we look to you as Congress and as a Committee—number one, let us spend the funds that are collected. If it was fair to collect those funds for a purpose of transportation, let us spend them. The second thing we are looking for is very simple. We think there should be a fair share to each state, a fair share to Missouri from this program. If you look at those two things and what it will take to do those two things—we have a program which you have probably heard about that has been offered from the Association of State Highway Officials, the 20-20 program and what have you. Also, the program that is being proposed by the Federal Highway Administration. Those proposed programs that are before you and will continue to be before you does exactly that.

What it means to Missouri—and this is where—to give you an indication that the stakes are very high for us—we would need about $200 million more for Missouri than we now receive in federal funds under the highway program. We now receive $250 million. That is almost a doubling of our federal program. Congressmen, that would have a lot to do with when and if we dual lane and work on I-66 or Route 60, if we expedite Route 71, particularly if we expedite the construction of dual lane to Kansas City. It would have a lot to do with that.

Let me ask for three other things. One is, we plead to you for timely passage of the federal program. It is going to come quickly. October 1991 is going to be here very quick. Second is the deficit. We think that user fees must be preserved for transportation. And to use the gas tax for federal deficit reduction, we do not think is a good idea at all. The other thing is the gasohol and the clean air. That is, we see you facing a big problem there. We think we face mandating a gasohol, and we think for clean air, that is only right possibly. But if it is mandated, why should the exemption on gasohol be extended? We do not think that makes any sense.

Basically, the last thing that we are very concerned about is something that you face, and I do not envy your task one iota, and that is between now and October 1—sequestration. What is going to happen about the deficit? We plead to you not to let sequestration happen because as we understand it, that will withhold approximately $100 million of our present $250 million federal program. That would be super crippling to our whole efforts.

Mr. Chairman, those are my comments. Thank you very much.

The **Chairman**. Thank you, Mr. Muri.

Senator Russell.

[The prepared statement of Mr. Muri appears on p. 1532.]

Senator **Russell**. Thank you, Mr. Chairman and members of the Committee. I appreciate the fact that you are here on a holiday weekend or getting ready for a holiday weekend. And maybe you are going to spend it in the Ozarks or maybe you are not. But, wherever you are spending it, we hope you the best and we are pleased that you have come to this part of the nation to study infrastructure needs. You are only about 200 miles, or less than that, of the center part of the population of the United States. It is gradually moving southwest. So, we are pleased that you are here.

For several years, I have represented from seven to twelve counties in south central and southwest Missouri. Six of those counties are in Congressman Hancock's district. And so, I am pleased to, of course, be here with Congressman Hancock and Congressman Emerson. But, if there is one service that government provides that our constituents understand, it is roads and highways. They know whether they are good, or they know whether they are bad. They understand a little about the sewer system and a little about the water system, but every day, they are exposed to the highways, and they are pretty upset if they are not the best.

Many of our small towns and cities perhaps have not had the opportunity to upgrade their infrastructure for 40, 50 and maybe as long as 70 years. Those infrastructures have deteriorated rapidly and were not given attention at a time when perhaps they needed it. For the most part, I want to spend the next couple of minutes—and I hope I can do it in two minutes—to stress the significance of a safer, better highway system throughout our nation. There are many infrastructure needs unrelated to highways. For example, the Airport at Bolivar, the bridge at the Lake of the Ozarks—that is highway, though, is not it? But it is also tourist. And there is a lot of small towns that need some help with their water systems, their sewer systems. And I realize that the Congress and the administration have an awesome responsibility in trying to deal with the budget. And hopefully, it can be balanced.

But almost of the same magnitude and dimensions is the funding to bring America's infrastructure up to date. It is an awesome task. And now, it is complex and complicated by the fact that we have a necessary military build-up in the Persian Gulf, and of course, that we have to address for sure. In fact, I am not certain that the Federal Government can fund a strong infrastructure financing program and balance the federal budget at the same time. Now hopefully, some way, there can be a balance of these two needs, the infrastructure and the federal spending.

Let me move real quickly to the federal fuel tax. I did not visit with Mr. Muri prior to this meeting about this statement, so do not think we are in collusion here. But, I want to stress that if the Federal Government increases the fuel tax, it will have a devastating effect upon the states that depend upon fuel tax to fund their highway program. I would urge you not to increase the federal fuel tax because it simply will ruin Missouri, in my opinion. Just a few years ago, we increased it to 4 cents. We are still among the lowest, and we are getting ready to raise it again perhaps if the people approve it. But, if the Federal Government increases the fuel tax, I can almost guarantee you the voters will not approve a Missouri fuel tax.

I had some things written here. These are not very extensive notes about how effective the highway system is in Missouri, and we really are proud of it because they do a lot with what they have to work with. And there is—the highway funds in Missouri are not used for a lot of other things like they are in some states. So, the money is well spent, and we are proud of that. But, there is a great need in Missouri—32,000 miles of road, much of which is narrow two-lane highway, narrow shoulders and sometimes unsafe and inadequate bridges. And, I am sure there is going to be a lot of other people talking to you about that.

Many areas of the state do not have rail service, as it is in Congressman Hammerschmidt's district. There is not a lot of rail service in this part of the country. I can drive from Jefferson City, Missouri to the city limits of Springfield and never cross a railroad track or go under a railroad track. Jefferson City is the state capital of Missouri. Much of that area is in my district. Furthermore, I will be 25–50 miles from even a railroad period. So, you can understand how important rail—I mean highways is to this state.

Reference has been made by some of the Committee members of Highway 60, 13, 65 and we could talk about a lot of those routes; but I am sure they are not all that important to most of the Committee members because they are just numbers on a map that help people move about. Highway 32 and Highway 54 and all of those serve tourist areas. The Lake of the Ozarks, Lake Stockton and several other places. Mr. Muri and his staff are looking at the Lake of the Ozarks situation. Traffic there is really snarled because of highways. A fast build-up of a tourist area that was almost unforeseen and could not be predicted a few years ago. So, there is a lot of needs, and I know that that is what you are looking at and I appreciate the fact that you have this tremendous responsibility.

Might I further stress the importance of seeing that all states receive the money that they are entitled to and hear what Mr. Muri has to say about that. I do not know the details nor the process. But as I understand, Missouri would be a few million dollars ahead and further along had we been able to get the highway funds at the appropriate time and at the right time.

Now, let me summarize real quickly and I think—I do not think you misunderstood what I said. Do not increase the federal fuel tax. It has a devastating effect upon the states that depend on gas tax. Address the present flow of highway funds to the states. And I would urge you not to use federal highway funds for demonstration and designated routes, at least to the point that you would deplete those funds. I realize and I understand all that. In Missouri, we do not get to do a lot of pork barreling, but I kind of enjoy it when I do. So, I understand all that, but do not deplete the funds.

And for the future, there may be an opportunity as money becomes available to encourage the development of rural water districts and rural sewer systems. There are many little communities throughout our state that do not have any sewer system to speak of at all and the water system is rather inadequate. And there is a lot of opportunity there to improve the environment, as well as improve the infrastructure.

There may be a need for private capital in this area, perhaps tax-free bonds or some other incentive. I am not an expert in the area, but I certainly recognize the need to keep the private sector involved wherever possible.

Thank you, Mr. Chairman and members of the Committee.

The CHAIRMAN. I want to thank you both for your excellent statements. And my question, I think, would apply to both of you. What steps has the state taken—or does it propose to take—to assist local governments with their critical road and bridge needs?

Senator **Russell**. Mr. Chairman, I might try to address that. Missouri, at the present time, has a rather tight budget, and we have not had a great deal of success in passing some funding mechanisms to fund some of these programs. But by the same token, we do have some clean water programs that are very highly—very well accepted and very much in demand and almost over-utilized. There is a greater demand than there is money is what I am trying to say. And that has been one of Missouri's most successful programs. And thanks to, I think it is Farmers Home Administration, they have been able to work with rural water districts and also some rural sewer systems. And there is further attention being given to that through the Department of Natural Resources. The Highway Department—and Mr. Muri may want to address this—does provide some funding to the cities and counties out of that gas tax that I spoke about. So, there is—and if that gas tax is increased, there would probably be some of that going to the local governments.

Mr. **Muri**. I would only add maybe two things. We work very, very hard in a full partnership with the city, county and state, so we are sharing all of the resources, all of the information, all of the engineering expertise, everything that we have. So, we are all pulling together in the same direction.

Number 2, we took a lesson from California. Just recently proposed and passed in legislature some innovative funding techniques that involves private investment, transportation districts, transportation corporations and those kinds of things. We think that will help.

The **Chairman**. John Paul.

Mr. **Hammerschmidt**. Thank you, Mr. Chairman. Mr. Muri, we are delighted that you brought your testimony before us. You are always a good witness, whether you are here or in Washington, so we appreciate hearing you again this morning. Senator Russell, you gave us a very fine statement of needs in your district and the state of Missouri. We appreciate your testimony. I have about nine questions prepared here. I am not going to ask any of them because we have so many people on these panels this morning that we just do not have time for questions. And I know that your written statements are complete and comprehensive. So, I will forego questions. But, I do want to express my appreciation to both of you for your fine testimony.

The **Chairman**. Thank you. Greg.

Mr. **Laughlin**. Mr. Muri, it is good seeing you again. I appreciate your testimony today. It was informative as it was in Washington.

Mr. **Muri**. Thank you.

Mr. **Laughlin**. On page 8, you address a concern that I think this Committee has hopefully tackled in a satisfactory way, and that is the conforming provisions that would allow the EPA to pass on each highway construction project. As I understand on this Committee, we got that language taken out of the House Bill and it is still the old law where they looked at the overall community commitment. However, you are correct in that the Senate version still has that language of "project by project" and anyone that has dealt with the EPA knows that while they have a good mission, if they are to review each highway construction project by project, we will have no highway construction in America—is my opinion. And I would suggest you get both of your United States Senators to work on the Senate side of that conference committee. I do not know whether either one will be on that conference committee; but certainly, they will have friends who are, and we need that addressed.

Certainly, we want a clean environment. We want the highway contractors and highway construction to comply, but it needs to be an overall approach, rather than project by project. So, I appreciate your bringing that to the attention once again. Thank you, sir.

Mr. **Muri**. What you said is exactly on target.

Mr. **Laughlin**. Thank you.

The **Chairman**. Congressman Jim Inhofe.

Mr. **Inhofe**. Mr. Chairman, I have no questions. I was glad to hear the comments.

Senator Russell, we did need to come here and find out what your feeling was about a proposed fuel tax increase, and you have made that abundantly clear.

Mr. Muri, I think you know this already, but perhaps some people in the audience do not. Those of us at this table here and serving on Chairman Anderson's Committee are all committed to taking the—getting the highway trust fund off budget, releasing those funds for the purpose they were designed to be spent for. And so, we have that—our Committee has been committed to that for quite some time.

The **Chairman**. Congressman Bill Emerson.

Mr. **Emerson**. Thank you, Mr. Chairman. I just want to say both to Senator Russell and Mr. Muri what a fine job I feel—I am sure Mel does, too—as a member of the Public Works & Transportation Committee of the U.S. House of Representatives to have such wonderful resources to turn to as the Missouri Department of Highways and Transportation.

And Senator, from your legislative oversight perspective, I want to tell you, these people do an outstanding job. And, I feel we have got—we have between the Missouri Department of Highways and Transportation and certainly those of us from Missouri who are on the Public Works and Transportation Committee, one of the finest examples of federal/state cooperation and liaison going anywhere. And Mr. Muri plays a very large role in that, and we are grateful to have the opportunity to work with him and the people in Jefferson City who work with him as well. Thank you.

The **Chairman**. Our host, Congressman Mel Hancock.

Mr. **Hancock**. Thank you very much, Mr. Chairman. I would like to make just a real brief comment because we do have a lot of other witnesses. The statement that my good friend—extremely good friend—Senator John Russell started out with where he said that he and Wayne, Mr. Muri, were not working in collusion. The only thing I can say is, if you want to meet me afterwards, we will collude to try to stop a gasoline tax increase. So, I am willing to work in collusion with anybody to prevent a gasoline tax increase because of the impact that will have on southwest Missouri.

I also would like to recognize this, Mr. Chairman. I think this is somewhat unusual and one of the things that makes me proud of the 7th District. That is that another state senator is present at this hearing. He is taking his time today to come over. He will not be a witness, but I would like to recognize him from the Joplin area, the newest state senator, in fact, the Honorable Marvin Singleton, who is sitting back in the audience there. Thank you very much, Mr. Chairman.

The CHAIRMAN. Will you stand up? Good. Okay. Thank you very much.

And our next panel consists of Mr. Thomas Finnie, City Manager for the City of Springfield; Mr. Robert Hancik, Director of Aviation of the Springfield Regional Airport; and Mr. Harold McCoy, Director of Public Works for the City of Joplin. Gentlemen, please be seated. Take the order if you want, Finnie, Hancik and McCoy.

TESTIMONY OF THOMAS FINNIE, CITY MANAGER, SPRINGFIELD; ROBERT D. HANCIK, DIRECTOR OF AVIATION, SPRINGFIELD REGIONAL AIRPORT; HAROLD L. McCOY, DIRECTOR OF PUBLIC WORKS, JOPLIN

Mr. FINNIE. Thank you, sir. On behalf of the Mayor and the City Council, we would like to express our thanks also for your making the time and the energy to come here and visit us. I would underscore that by passing on that I have had well over a dozen phone calls from people in the community with suggestions that they would like me to pass on to you. I have built many of those suggestions into my formal written testimony. I will confess that I have decided to keep a couple of them just to myself. [Laughter.]

As many of you know, Springfield is a regional center. It is a growing regional center. I think our citizens have recognized that. In recent months, our public, our citizens have passed referendums that have caused significant expansions in the—in our sewer treatment system, a quarter cent sales tax increase for capital improvement programs, including roads and bridges, a major school increase—bond issue increase—as well as a public referendum on fee increases. Without question or doubt in my mind, our citizens put a very high priority on infrastructure improvements. They recognize that while there are some things that may not be critical and they exercise some discretion in approving those, they have been very consistent, I believe, in recognizing the importance of the infrastructure improvements to a growing community.

Our elected officials have also recognized the importance of infrastructure, not only in taking to the citizens those needs that I have just expressed, but also looking to the future. We are now spending significant energy and some dollar resources on looking at fiber optic needs. I believe, as do many people in this community, as we look at our infrastructure needs, we also need to look at future needs, and fiber optics may well be one of the infrastructure needs of the future, and we are right now looking at that and planning for that need.

We can use your help. I very much appreciate the comments that have been made today about the importance of infrastructure. We share that. We feel like there is a need for the national government to recognize that there are some improvements which are essential to Springfield and this region. We need, as a region and as a community, improvements in the highways between here and Kansas City, going east toward Poplar Bluff and the interstate connection there. We need those desperately. As many of you have commented, those are not costs. I truly believe that that is an investment in a national and regional productivity—not a cost to us or to you. That will improve our national productivity. It would improve our regional productivity. And those are projects that the City of Springfield and even the county and region cannot do on our own. We need your help.

We need your help in using the resources of the Federal Government to establish national policies and national standards. I think that many of us in this community do not object to national standards. We put a very high priority on protection of our ground water and our water supply. To the extent that the national government has the resources and the expertise to help develop those standards, that is something you can do. We do not have the resources always to set those standards. I would ask your help that as you set those standards and you pass legislation that you also include in that legislation fiscal impact notes and funding that is in harmony with who is causing the problem and who is benefiting from the problem. To expect the City of Springfield to single-handedly address water supply problems is unrealistic. As you set standards, please keep in mind that in many cases, these are regional and national needs and should be shared at the regional and national level.

And finally, I would ask your assistance in reducing the complexity and the regulations that impact all of us. Fifteen years ago, in many of our communities—probably most of our communities—if the local elected officials recognized a need for something that was funded through a revenue bond, it was a simple matter. They approved it at the council level, and then the marketplace decided whether it was a good project. On a revenue bond, what is better than the marketplace telling you whether you have a good idea or not? That is what this country is all about. Today, those same kind of needs require city council approval, here in this community, they require a public referendum. They often require state approval. They often almost inevitably require a test where they pass Federal legislation. By the time we get though all these tests, the project has almost been forgotten about.

Further, as more legislation occurs, it simply inspires us at the local level to come up with more creative financing, which then, in turn, inspires the state and federal government to come up with ways of controlling that creative financing. The end result is sometimes, instead of providing facilities that our public wants, we simply act as a catalyst to create a whole new profession in the accounting and legal areas. The increase in lawyer fees, the increase in accounting fees—while I do not want to insult either one of those professions—are not necessarily adding to our productivity. We need those projects. We do not need to be spending time on the regulations.

Again, I thank you. We appreciate this opportunity to be part of a partnership not in spending money, but improving our productivity as a country and as a region and as a city. Thank you very much.

The CHAIRMAN. Thank you, Mr. Finnie.

Mr. Hancik.

[The prepared statement of Mr. Finnie appears on p. 1486.]

Mr. HANCIK. Good morning, Mr. Chairman. I am Robert Hancik, I am the Director of Aviation for Springfield Regional Airport, President of the Great Lakes Chapter of the American Association of Airport Executives and our community is also a member of the AOCI. On behalf of the City of Springfield, the Airport Board, and of course, our organizations, we express our appreciation for the bold and aggressive leadership the Public Works Committee has shown to date on airport issues; in particular, yourself, Mr. Chairman; our neighbor to the south, Mr. Hammerschmidt; and of course, Mr. Hancock.

You are continually hearing from the testimony of the heavy hitters; however, through representatives like Mr. Hancock, we have had the opportunity to provide input from the smaller airport operators. I wish to briefly express my views relative to the issues you have successfully addressed and their effects on southwest Missouri and many airports like Springfield.

Each of your successes, reauthorization of AIP, encompassing the most important Passenger Facility Charge, tenant liability language and the fending off the Alamo issue affect Springfield, Missouri as it would a major hub airport, but proportionately, with a greater financial impact.

The capital needs of Springfield Regional Airport, which services not only Springfield, but southwest Missouri and northern Arkansas, are obviously beyond the financial capabilities of this community when weighed against the city's general infrastructure needs of sewers, storm drainage, streets, solid waste disposal and so on. We are in the final stages of our master plan study. Our preliminary capital costs, which we are revealing this morning, are estimated at $56.8 million over the next 20 years and are further detailed on the attachment to the written testimony. $27 million in infrastructure in the next five years, $18 million identified as being eligible under the current AIP program.

We recognize the financial restraints of FAA facility improvements for operations and safety. However, our growth with approximately 100 airline departures a day, need to be recognized in the authorization process, but not by place naming projects in the appropriation, but decisions made on operational data and safety standards.

Gentlemen, we truly serve a regional area. This region is faced with growth beyond its infrastructure capabilities, not only in the tradition of business and industry, but I am sure you will hear by the demonstrated growth in the medical field, retirement and tourism. $250 million in goods passed through our port of entry in 1989, most of it from the Far East.

The intent of the aviation trust fund has been eroded and continually raided over the years. It has been used as a political pawn at the expense of the air traveler. Changes to the current AIP program and its predecessors have only put patches on an exploding inner tube. It is time to start rethinking how the estimated $50 billion in airport capital improvement needs of our nation's airports will be funded in the next five years. Yes, I believe in the current trend and the philosophy that the users should pay for the system. However, we must temper that philosophy by the country's interest and investment in maintaining and building a national air transportation system second to none. We all benefit from air transportation of people and goods, indirectly or directly, whether one ever flies in an airplane, be it via the airlines or in the corporate and general aviation fleet.

Again, I state it is time to rethink the funding of this country's airport infrastructure. The PFC is an obvious element in that equation, for which I applaud your foresight and hope the Senate eventually agrees. It must be noted that those small airports that feed a hub dominated by one air carrier have extremely high air fares, and the impact of an additional $12 per ticket must be measured by the spoke airport on diverting the passenger to the automobile, which in turn, will cause other problems. The current funding percentage of the AIP program offer little discretionary dollars and decision-making capabilities on projects that need to be done. The protection of unspent airport entitlement as a debit against the current year's appropriation needs to be eliminated. If an airport does not have a project, let us not bank the dollars, but get it into the system. Obviously, the trust fund must be taken off budget.

Unfortunately, my time is limited. I hope we can continue the aviation subcommittee's work in their efforts as we continue our legislative fight. Thank you, and I would be happy to answer any questions.

The CHAIRMAN. Mr. McCoy.

[The prepared statement of Mr. Hancik appears on p. 1502.]

Mr. McCOY. Thank you. Thank you for this opportunity today. I represent the City of Joplin, which is the fourth largest metro area in the state of Missouri. I would like to briefly summarize our written statement.

Highways are an important future—important infrastructure in our future. We are the home of 34 trucking terminals, four of those which have headquarters in Joplin, and you will hear statistics about the importance of that to our community later.

We do support the Missouri Highway Department's position that funds should be allocated on the number of roadway miles within your governmental boundaries.

We are supporters of the 71 project, which is from Kansas City to Shreveport. We urge the continued development of this project, hopefully, to a freeway standard and maybe to I-49 in the future.

We have one major concern. Most highway bills are leaving the urbanized area out of the funding picture. We urge you to look at the effect of that on communities. Communities have approximately 18 percent of the roadway miles and 58 percent of the travel within their boundaries.

Joplin also operates a small general aviation airport. We are, too, opposed to the increase in airfare taxes because we have been devastated by the deregulation. We have lost revenue because of deregulation. We cannot meet our present entitlement funds.

We further believe that general aviation needs on small air carrier airports should not be taken out of entitlement funds. It should be funded out of discretionary funding.

We are also concerned about consolidation of the flight service stations. They have generated a safety problem at local airports after the control tower closes.

And the program of wastewater—we are concerned about the EPA's loan program. We think that the first series of projects will probably make the funding by the local residents. We are concerned of the long-term effect after project and project and project is asked to be approved—the ability of the local citizens to fund this program. We have made great strides in cleaning up our water in the last decade. We feel that this program would devastate that in the next decade. In Joplin, if we had to fund our past program, our sewer rates would double and quadruple in the future in the next decade.

We, too, are from conservative southwest Missouri. We believe in a balanced budget. But, we do not believe in balancing the budget through highway user fees or aviation trust fund. We urge you not to allow that to happen.

Thank you for allowing us to make this statement.

[The prepared statement of Mr. McCoy appears on p. 1526.]

The **Chairman**. Thank you very much, all of you, for your remarks. Looking at the infrastructure problem from the local perspective, can you give us some idea of what steps you think should be taken to meet your particular needs and what kind of help you expect from the state and federal government? And I also want to congratulate you on your comments on trust funds off budget. That is one thing that we have been pretty much out in front of in the fight in Washington, and we missed it by—what was it—six votes, I think—was it not?

Mr. **Hammerschmidt**. Five.

The **Chairman**. Five votes. When you almost pass on five votes, this means that if we shove just a little harder, you get a vote here from different states, and of course, one of the best ways we can get those votes is when people like you let your own Congressmen know how they feel because it is a tough issue. It is pretty hard for us to see what the trust funds have got to do with the deficit anyway. Usually, we set those up as a special fund to do a specific project. And why they should—money should be taken from those to——

Mr. **Hammerschmidt**. In most cases, they need to let their Senators know.

The **Chairman**. Absolutely right. Yes. In addition to Congressmen, John Paul said let your Senators know. So, we are in pretty good shape in the House. I really should not say that when we are five votes short, but that is pretty close. We do also urge you to contact your Senator.

My question again is, what kind of help do you expect from state and federal government?

Mr. **Hancik**. Mr. Chairman, as far as the aviation trust fund is concerned, I would be happy to take Harold's entitlement money in Springfield since he is not going to use it. But, under the auspices of the various assurances in the grants that we all commit to, I think there is some opportunity for some creative financing related to paying for airport infrastructure. However, there are constraints within the sponsor's assurances that prohibit much of this creative financing. We recently went through a program which we were very pleased with, that the Administrator of the FAA, especially in the Airports Division, made a policy decision that allowed us to do $5½ million worth of our match for a terminal building—a new terminal building, not the G.A. building, but the air passenger. So, there is an opportunity there for private money to come into it. Sometimes, there are grant restraints that we cannot do that.

And, I might—the other comment I would like to—one other thing I would like to emphasize is the problem of the banking entitlement monies, you know, which goes against the appropriation process, rather than being added to it. By the time you guard everybody's money in the AIP program, there is very, very little discretionary money left over the years, which I am sure you are aware of that, Mr. Chairman. Thank you.

The CHAIRMAN. Do either of you want to comment on that question?

Mr. FINNIE. At the risk of over-simplifying it, I would urge you to do two things. One, spend the money that you have already raised. I think if we were sitting on top of that kind of money here at the local level, they would blow us out of the water or demand a rebate, one or the two. And, cut through—every opportunity you get—cut through the inflexibility, the additional rules and regulations that do not provide more services, but simply provide spending money on auxiliary things that do not provide the actual product to the citizen. If you could do those two things at every opportunity you get, I think we would all benefit.

Mr. McCOY. We concur in the statement that—spend the money that you have raised for the purpose it was intended. We concur to—in taking the regulations off of us that restrict us from raising money on a local level to accomplish our end of that project. We urge you to release—get those funds released so they can be spent for their intended purposes.

Also, in the Federal Aid Urban Highway Program, we would urge you to continue that program in the future. We think it is very important to local governments.

The CHAIRMAN. John Paul.

Mr. HAMMERSCHMIDT. Mr. Chairman, again, I am going to defer questions because they have submitted good, complete testimony and also given us good verbal testimony. You know, no one is closer to the problem that we are here to discuss today than public works directors of cities or city managers or deputy city managers either. And so, we appreciate very much getting your down-to-earth testimony. We know you know the problem and, of course, we are all singing from the same sheet of music, I think.

Robert Hancik is well known to us because he has been active in AAAE and as President of the—what? Great Lakes Regional section of AAAE, which is the organization—for the benefit of those out in the audience that do not know—that represents the smaller airports. They are also a member of AOACI, which represents all the airports. And so, he is very capable, and I have heard him in meetings. He is very vocal in speaking up for the needs of Springfield and what airports of its size need, so we appreciate his testimony very much. Of course, I agree with everything in it.

I know that we should not cap those obligational ceilings as we have to do. We do not do it, but the Appropriations and the Budget Committee do it. We think those monies should be uncapped in Function 400 of the budget to where you can get your fair share.

I guess the only good news, if we could move that passenger facility charge bill that has now passed the House on through the Senate, that will spend the pent-up funds in the aviation trust fund from $7.6 billion down to one billion dollars over a five-year period if we can move that bill all the way through—that is a big if. But, at least it is a start towards spending the money out that the users have paid in. But, I think you know that as well as we do, Robert.

Thank all of you for your testimony.

The CHAIRMAN. Greg.

Mr. LAUGHLIN. I appreciate the comments each of you have made, and Mr. McCoy, in particular, your comments about the passenger facility charge. I know your Congressman, Mel Hancock, and I both very reluctantly passed—voted for passage of that, and I do not remember Mel's voting technique; but I voted against the passenger facility charge in the Aviation Subcommittee, telling the Subcommittee Chairman I was doing it to ensure everyone knew that I was willing to vote against it and would keep a watchful eye because there are no airports in my district that can collect that tax.

I represent a large rural district, and we have had Wall Street bankers come before our Aviation Committee, and they talk about how wonderful the hub system is and why it is good for all of America, and the smaller communities might have fewer flights, but they will have more quality flights and so forth. And, I asked them what they meant by smaller communities. I was shocked when they said, Memphis, Tennessee. To Wall Street bankers, that may be small; but from rural America, I do not have a city even half the size of Memphis, Tennessee. And so, when Secretary Skinner and others from the FAA came to testify about the passenger facility charge, I wanted to be sure they were talking about communities like Joplin and Springfield and the communities in my district that operate small municipal airports for the most part for general aviation and not even commuter service. And with that assurance that with this passenger facility charge, a certain percent of those capital improvement funds would be dedicated to small airports, on the second day in full committee, when Chairman Anderson was there, I know I voted for it, and I recall Congressman Hancock did. But, very reluctantly, because we are jealous about our small, very necessary municipal airports coming out on the short end of the stick. So, while you expressed concern, I want you to know that there is at least two members of the Aviation Subcommittee that are going to be watchdogs on that.

Thank you very much.

Mr. McCOY. Thank you.

The CHAIRMAN. I suppose I should say something. I got involved in this many years ago. At the time, almost every time you got on an airplane—and of course, I am very close to LAX, and we have some problems there—almost every morning you pick up the paper, the story was about the near miss of the day before when something almost happened, but did not. And of course, some of them were not near misses. I had one where 12 people were killed, and that was not a near miss. And so, we have this. The California State Chamber of Commerce got ahold of me, and they had a meeting and they told about the problem. They said, "So many of the people in the state are in the Chamber of Commerce, they are connected with plants that have branches either in Los Angeles or St. Louis or Chicago, so they have to be on an airplane almost every week going to different places." And they said, "It is unsafe, and we think you should be doing something." I said, "We would like to, but," I said, "We do not have any money. Where will we get the money?" And they said, "Well, tax us. We are the users." And so, I asked some questions about it, and I think they saw that I needed a little bit more convincing.

So, they had a second meeting, and it was in the County Hall in Los Angeles, Supervisor's Chambers Hall. I remember—I think Senator Pete Wilson, a Republican, was there with me at that meeting. And, we went on with the same meeting and when they said, "Well, tax us," I said, "What do you mean 'us'?" Well, they said, "Those of us who use the airplanes are the ones who do not like to read this near miss, particularly on the day that we are going to be flying in the airplane." And so, they suggested what we now call ticket tax—8 percent ticket tax. So, we put an 8 percent ticket tax on with the idea that that money should be spent just for making—trying to make our airports in this country safer.

Then, we got the money in here and there is money in the trust fund right now, but they will not let us spend it. If they do not spend it, it makes the deficit look less if you have $20-$30 billion sitting in a trust fund. You do not spend it. And then, you sit it right along side of the real deficit we have. You add the both of them together, it makes the deficit look a little bit better. And we said, "There is no relationship between the national deficit and these people who are willing that the tax—have them taxed that are using the airplanes." But, that is where the problem is. We have money sitting in the trust fund, and for all three funds—the highway trust fund, the transit trust fund, the airport trust fund—all the money in there.

And we have got to somehow get that off budget, get that so we do not spend that. So, I know, I feel dishonest when I tell people, we are going to put a ticket tax on, but every penny of it is going to go to make our airports safe. But to have it and not spend it makes me feel like I lied. And yet, our intention was not that. Our intention was to spend it, just like the highway.

I remember the last time when under Secretary Drew Lewis, when they put a—I think a 5-6 percent tax on gasoline. I remember, I went on television with Drew—Secretary Lewis, and we said, "Every penny of this is going to be spent to repair highways." And yet, you know, it is sitting there today with $20-$30 billion. So somehow, we have got to get that money released.

And the best thing I can say to you people—let your own Congressman and your own Senators know that we do have a job, but we are only five votes short here on one vote. That shows there is a pretty good place to fight.

The **Chairman**. John Paul. I am sorry. I did not know you were——

Mr. HAMMERSCHMIDT. Either Mel or Jim Inhofe.

The CHAIRMAN. Jim.

Mr. INHOFE. Thank you, Mr. Chairman. I guess we are beating this horse to death on the trust funds; but, it is so significant. And, I remember working the floor in 1987 when we lost it by five votes. That means a change of three votes would make the difference. You have unanimity in this group here. It was the Public Works and Transportation Committee that carried that ball to the—to Congress and almost got it passed. I think we are in a position now, if we can continue to get the bills that we have talked about in our Committee passed through Congress into law to spend down that trust fund. Specifically, we are talking about over $7 billion in the aviation trust fund alone. So, that is a very significant thing.

I have been a commercial pilot for, I guess, about 35 years. And when I think about—we have twice as many people up there flying as we had back before deregulation and the same number of controllers. Something you said, Mr. McCoy, is very significant. I am glad that there is an understanding of it, and that is this change in the—of the flight service stations. As a pilot, we know that we cannot get the attention necessary to fly safely up there by dialing an 800 number. You lose that personal touch—that ability to make your own decisions. That is another fight that we are involved in in Congress now.

And, I would say, Mr. Finnie and Mr. Hancik, you both commented about the over-regulation and about the local discretion. Well, I want you to keep in mind this is one of the unique committees where most of us here have served at the local level. Chairman Anderson and I both were mayors of cities, and so, we know what you are talking about. We know the cost of over-regulation in our society. We will do what we can. We will try to do a better job for you.

The CHAIRMAN. Bill Emerson.

Mr. EMERSON. No questions, Mr. Chairman. Thank you for your statements.

The CHAIRMAN. Mel.

Mr. HANCOCK. In the interest of time and just glancing through here and counting up 16 more witnesses that I know we all want to hear, I will defer. I have the opportunity to meet with these people pretty regularly. Thank you, Mr. Chairman.

The CHAIRMAN. Thank you very much. And our next witness is Colonel Charles C. McCloskey, District Engineer, Little Rock District.

Colonel McCloskey.

TESTIMONY OF COL. CHARLES C. McCLOSKEY, DISTRICT ENGINEER, U.S. ARMY CORPS OF ENGINEERS, LITTLE ROCK DISTRICT

Colonel McCLOSKEY. Mr. Chairman, members of the Committee. As District Engineer of the Little Rock district, I am pleased and honored to be here today, along with my Chief of Planning, Mr. Ken Carter, to represent the Corps of Engineers concerning its civil works mission, as related to our nation's infrastructure.

Specifically, I would like to discuss our role in assisting the state of Missouri and local communities in addressing infrastructure needs. Throughout our nation's history, the Corps of Engineers has actively participated in planning, designing, constructing, operating and maintaining various aspects of this nation's infrastructure. Through our civil works program, the corps has been engaged in a wide variety of projects, including the construction of waterways and harbors, flood control projects and large multiple-purpose dams. The corps' military missions have resulted in the construction of large military facilities, including associated infrastructure, such as housing, roads, water supply and waste treatment plants and solid waste disposal facilities.

Recent studies by various organizations have focused on the long-term operation, maintenance and rehabilitation costs that our nation's infrastructure system would place on the shoulders of future generations. A report by the National Council on Public Works Improvement entitled "Fragile Foundations", concluded that we need to develop solutions today to rebuild our infrastructure with systems that promise reduced financial burdens for tomorrow.

The corps shares its concern for the future of infrastructure for which we have responsibility. Significant changes in project financing have already occurred. Due to federal budget considerations, the Water Resources Development Act of 1986 made cost sharing mandatory on many types of water resources projects. This principle has improved project selection, reduced costs and ensure that the most deserving projects are constructed.

As for this region, our district includes all or part of 24 counties in southern Missouri. Over 700,000 persons live in this 11,000 square mile area. The White River basin lakes are a vital part of the economy of this region. Although built primarily for flood control and hydropower, a large and important recreation industry has developed in conjunction with the lakes, as evidenced by the growth of the Branson area.

Table Rock Lake, located just west of Branson, covers about 50,000 acres. Annually, this project provides about $2 million in downstream flood reduction benefits and produces $500 million kilowatt hours of hydropower, which is marketed locally to the associated electric cooperative. However, the lake also receives about 6.4 million recreational visits to its 15 parks. Accordingly, there is an increasing demand to give stronger consideration to recreation concerns in the operation of the lake.

The same is true of Bull Shoals and Norfolk Lakes' infrastructure, which services southern Missouri. Although the dams are located in Arkansas, portions of these lakes extend into Missouri where eleven parks are located. Hydropower from Bull Shoals is also sold directly to the associated electric cooperative.

Clearwater Lake is located in southeast Missouri near Piedmont. We have a local request to raise the lake level about 20 feet to enhance recreation.

Though none of these lakes are currently used for water supply in Missouri, they do offer an alternative high quality source for the people of this region. The Corps of Engineers stands ready to support the future federal role in infrastructure. Given the size and nature of these problems, there must be a vigorous pursuit of solutions. Not only must we use existing programs effectively, but we must establish new and creative approaches for effective partnerships between federal, state and local government and the private sector.

Mr. Chairman, that concludes my remarks. I would be pleased to address any of your questions.

The **Chairman**. Well, thank you, Colonel, for your statement. I suppose my question is, what needs to be done at the federal and local level to address flood control and other problems of this area? And, do you think that local governments have a sufficient revenue base to meet their statutory cost share in meeting those needs?

Colonel **McCloskey**. The needs that we have been able to project, we have put into the budget process. We think we have a good relationship with the local governments, state government and we work closely with them. As to the adequacy of their funding, I would just say that the needs appear to be considerable, and a lot of funds are required.

The **Chairman**. John Paul.

Mr. **Hammerschmidt**. Thank you, Mr. Chairman. Thank you, Colonel McCloskey.

Mr. Chairman and my colleagues, I might say that Colonel McCloskey and my office are in touch if not weekly, on a regular basis regarding many, many projects operated by the Corps of Engineers, and as Colonel McCloskey has said, those important Corps of Engineers lakes—Beaver Lake, Table Rock Lake, which we share with Missouri, Norfolk and Bull Shoals—all tremendous facilities that were built in the 1940s and the 1950s and 1960s at a cost—if I remember right—anywhere from $50-$70 million for those dams. What a tremendous investment that has been for us to furnish flood control and hydropower, recreation.

And now, we—I noticed the other day that in a repair job just for one of those dams that has a leak, $17 million—probably about a fourth of the cost of what those early dams cost in their entirety, to show you how good the investment was before the inflation occurred. But in this part of the country, that is very important to all these people here—Jim Inhofe's people from Tulsa come over and enjoy those lakes. Of course, Bill Emerson and Mel Hancock—all of us enjoy these wonderful lakes we have here. We appreciate the Corps' good harboring of those resources and their nurturing of them and the way they respond to our needs.

We had a tremendous flood here this spring which overwhelmed the systems; but, it was mainly on the Arkansas River south of here. But still, this area received some of that flooding, too. I guess Springfield had a part of it; but, I am not sure. But, I know we had severe flooding in the Arkansas and on the Red River in the Tulsa district on down below and southwest. But, the Corps has always been very responsive to that. And now, they are really under the gun because when people are flooded out, they do not really understand and they do not want to hear about the hydrology and the way that great system is operated. And I understand that. When farmers are devastated, they are not good listeners.

But anyway, I am just delighted Colonel McCloskey is here as a key witness today and appreciate his comprehensive statement for the record. Good to see you, Colonel.

The CHAIRMAN. Congressman Jim Inhofe.

Mr. INHOFE. I have no questions, Mr. Chairman.

The CHAIRMAN. Bill Emerson.

Mr. EMERSON. Thank you, Mr. Chairman. Colonel, until late yesterday evening, I was making a number of rounds in my Congressional district, which lies in four different Corps districts, Memphis, St. Louis, Kansas City and Little Rock. And I wound up late yesterday afternoon down in Butler County, where—that is Poplar Bluff—where I ran into as irate a group of farmers as I have ever run into in my ten years of serving in the Congress who were telling me about the fact that the Little Rock district has three new employees who are coming around Butler County utilizing all of the delicacy of King Kong using a sledge hammer issuing 404 citations to a bunch of innocent rice farmers who are simply trying to shore up their levees.

Now, I know we have got a lot of problems relating to wetlands issues. But with the need that we have for infrastructure improvements in this country and with the difficulties referred to by my dear friend and colleague, Mr. Hammerschmidt, where you are really under the gun in having to do a lot of repair work as a result of the floods this past spring, I am curious as to where you get the resources to send three people around issuing 404 citations to Butler County rice farmers who are trying to shore up their levees.

I do not know if you can answer that question here today. But, you know, I was going to try to call you this morning. I did not realize you were going to be here as a witness today, so I think it is fortuitous that we meet this morning and I have the opportunity to share with you something that is very fresh on my mind from yesterday. And I hope that we may have a meeting on this subject with you and your staff at the earliest possible time and that we can understand what your modus operandi is and the purposes for it. Please comment if you care to.

Colonel MCCLOSKEY. We will be glad to look into that situation and to correct it.

Mr. EMERSON. Are you unaware of that situation?

Colonel MCCLOSKEY. I am aware that we have a large regulatory responsibility which covers Butler County, and we have a lot of permit applications. We have had a backlog, and we have been trying to work that backlog off. I was unaware that there were problems there, but I will look into and resolve them.

Mr. EMERSON. Thank you, Colonel.

Mr. HAMMERSCHMIDT. Will my friend yield?

Mr. EMERSON. I would be glad to yield.

Mr. HAMMERSCHMIDT. Colonel, I know this is above the district level, but we have great trauma over wetlands, as you know. But—and you have—you have to implement policy and regulations as they come down. But, we are still trying to write legislation. I know we had a memorandum of understanding between the Corps and EPA and thought that might have diffused it to a degree. But, I think Congress is going to have to put in statutory language what the intent of Congress is as it pertains to no net loss on wetlands and as it pertains to continued use for farming purposes, et cetera. I know you merely respond and implement regulations at the district level, but I want to join my good friend, Bill Emerson, in saying we have great concern about what is happening in the no net loss wetlands policy as it exists, and we are working on that legislation in our committee right now. Thank you.

The **CHAIRMAN**. Congressman Hancock.

Mr. **HANCOCK**. Thank you, Mr. Chairman. I just would like to thank Colonel McCloskey for appearing and coming up to Springfield today. I apologize for having to step out. In fact, I think I have to step out again here pretty quickly. But, thank you for coming. I will—your testimony has been submitted, and we will sure read it. And again, thank you for being here.

Colonel **MCCLOSKEY**. You are welcome.

The **CHAIRMAN**. Thank you very much, Colonel, for your presentation.

On the next panel, we have Mr. Peter Herschend, Executive Vice President of the Silver Dollar City and President of the Ozark Marketing Council; and Mr. William Kirkman of the Springfield Chamber of Commerce. You are first here, Mr. Herschend, so you might as well start off.

TESTIMONY OF PETER HERSCHEND, EXECUTIVE VICE PRESIDENT, SILVER DOLLAR CITY, PRESIDENT, OZARK MARKETING COUNCIL; WILLIAM E. KIRKMAN, SPRINGFIELD CHAMBER OF COMMERCE

Mr. **HERSCHEND**. Thank you very much, Mr. Chairman, members of the Committee. In deference to your request to hold the comments to two to three minutes, I have considerably rewritten my oral presentation. I will let my written presentation stand. And so, if you will give me the leeway of making some rather off-the-cuff remarks here, I can share it very, very quickly. I think I have two things that I would share with you, Mr. Chairman.

First, I think it is important that the Committee realize and recognize the size of an industry here in southwest Missouri called the travel industry—the tourist industry. Congressman Hammerschmidt, Congressman Emerson, Congressman Hancock are all highly aware of what the travel industry means to this part of the country. But, I am going to give you very few numbers. You get enough of those anyway. Two counties south of here are called Stone and Taney County. Congressman Hammerschmidt is familiar with those because they lie on the southern border of his Arkansas border. Those two counties have a magnificent population of approximately 50,000 persons—full-time population. The travel industry—the tourist industry here in southwest Missouri in those two counties equals on an annual basis one billion dollars—one billion dollars. It is a tremendously important impactful industry.

Those statistics will apply certainly to a lesser degree throughout the Ozark region. They reach well over into Congressman Emerson's district and certainly into Congressman Hammerschmidt's district. One billion dollars in Taney and Stone County. I can, with easy justification, point to 20,000 persons employed in the travel industry out of a population of 50—20,000 persons just in the direct travel industry. It is—it is an immense industry and highly dependent, as you might well imagine. We are a rubber tire marked, as some have said. You do not—you do not get to the Ozarks south of here in a 747. You get there in an automobile or in a bus. Period. We are absolutely dependent upon a highway system that has the capability of carrying those vehicles to and from our area.

I would like to tell a story if I could. The company that I work for is named Silver Dollar City. It is a theme park, and we see this year, 1,750,000 visitors, give or take a few thousand. It is a good-sized operation in this part of the world and in the travel industry. And we have a steam train there. As a matter of fact, we have five steam locomotives, and they run. They carry probably a million passengers a year. And when we first got those—when we first bought them back in 1962, they did not run so well. Oftentimes, they would, in fact, stop. And we found out the problem was most often caused by a—do not have a lisp when you try to say this—but by a stuck steam valve. And the problem with the stuck steam valve was that sometimes it would be halfway open, and sometimes it would be only a third of the way open, and you could not get the steam from the boiler to the engine wheels, which made the thing go.

And we found the solution. And Congressman Emerson, you will probably recognize the concept right away. We developed a technique called a stuck steam valve thumping stick. I dare you to pronounce that one fast. But, that is what we used. We would hit the steam dome with this thumping stick. And the steam valve would go pop open and sure enough, all of that power of the engine would be released.

Now, what in the world is the point of that? I would submit to you that you have two stuck steam valves. You—not personally—but the Congress and the Administration do. One you have spoken to directly this morning, and that is taking the highway trust fund off budget. That is a stuck steam valve if I ever heard of one. And you need a thumping stick on it. And we would support you with all the effort we can on getting a thumping stick on that. And the other is the reauthorization of the Surface Transportation Act. That is critically important to our industry—to the travel industry in southwest Missouri.

If the Congress and the Administration can use the thumping stick and get those two pieces of machinery on line so the power can flow adequately, then we in the private sector of the travel, the tourism industry—certainly here in southwest Missouri, but I promise you throughout this nation—can make a tremendous difference in the growth of the economy. We can take 20,000 persons employed and bring that to 25 and 30. We can reduce—we have demonstrated the ability to reduce unemployment in the off season. We are going to take it from a very, very high 14-16 percent that we experience in the wintertime. Where this year, we will drop it down to single digit unemployment in southwest Missouri. We will do it. But, we cannot do it if that doggone steam valve is closed. So, I would wish to you mentally a thumping stick. I will be happy to help you swing it. It really will make a tremendous difference for the economy of this region, and that is where the issue starts. Once we get that and get those funds into the capable hands of the Missouri Highway & Transportation Department, then I have every confidence that we will see the difference in surface transportation that needs to be.

Thank you, sir.

The CHAIRMAN. Thank you.

Mr. Kirkman.

[The prepared of Mr. Herschend appears on p. 1509.]

Mr. KIRKMAN. Mr. Chairman and Committee members. My name is Bill Kirkman. I am the Partner in Charge of Barry, Kirks & Dobson, a regional public accounting firm headquartered in Springfield. I also serve this year as President of the Springfield Area Chamber of Commerce. On behalf of the Board of Directors and 3,500 businesses and professional men and women who comprise the Chamber, welcome to our city.

Our Chamber of Commerce serves as the principal advocate of this community and its business. We are proactive in economic development, stimulating jobs and maintaining our high quality of life. Transportation is of eminent concern in our efforts. Congruent to our area needs are the needs of Missouri. We believe what is good for the state is good for Springfield, and what is good for Springfield is good for our state.

It is with this belief that we encourage and support the timely passage of a new Federal Highway Act, as proposed by the American Association of State Highway & Transportation Officials. We believe the greater flexibility and discretion in the use of funds, which is provided for in the proposed new act, is important to support all of our transportation needs.

Over the last 34 years, highway users have contributed billions of dollars in taxes, with the understanding that this tax revenue would be spent for construction and/or upgrading of the nation's highways and bridges. We believe that the revenue in the federal highway trust fund should be used for the purpose it was collected. We question a balance which exceeds the federally mandated minimum when the nation's transportation needs are multiplying.

We also advocate a fair share of transportation monies for Missouri. We believe that demonstration projects are not in the best interest of a good highway system and that a rational plan—one that is good for the entire country—is, by far, the better policy. These views are also reflected in the opinion of the Missouri Chamber of Commerce.

Springfield, our host city today, is Missouri's third largest city and is the center of the fastest growing region in our state. Our city is the regional center for commerce, health care, education, entertainment and banking for the southwest and south central portion of Missouri. Springfield is also the major goods distribution center for the entire southern half of Missouri, northern Arkansas, southeastern Kansas and northeastern Oklahoma. Coupled with Springfield being the gateway to the substantial tourism industry in our lake areas on the south, the north and the northeast, we are in desperate need of major highway improvement.

Of major priority to our city is the need for an interstate standard four-lane highway linking Kansas City and Springfield and continuing on to the southeast and southeastern United States. Lack of federal and state funds has also delayed and prevented the construction of needed freeways around our city, especially on our south.

Our transportation needs are not limited to streets and highways. We appreciate the increasing demands for adequate air service to Springfield. A master plan developed with broad community support has been updated and is presently being presented to the community for evaluation. As a Chamber, we support the infrastructure needs of the Springfield Airport and advocate the use of federal aviation monies to fund the plans.

Infrastructure is at the core of our Chamber mission. Economic development, air service to Springfield, the fresh water project of our city utilities and streets and sewer projects of the city go hand in hand with the tourism industry and our high quality of life in Springfield. Each factor is a part of a healthy economy, and each factor is a part of our Chamber's proactive plan.

The testimony you are hearing today expresses the concerns of midwestern citizens. Some of our needs are similar to those of the east and west Coast. And some of those needs are unique to us. In your role as United States Congressmen, we are certain you will weigh those needs of Missouri with equal consideration.

I would like to leave you with four key points that I think are very key, and we have heard repeatedly today, but I think they are very important. I will put those in what I call three do's that we would ask you and one do not do. I think we would advocate and ask you to release and spend existing funds and give Missouri its pro rata fair share. We encourage and ask that you do encourage the passage of the new Federal Highway Act as proposed. We ask that you do develop and that Congress does plan to spend funds based on need and not on demonstration projects. We ask that you—and this Committee particularly—and our Congressmen and our state do promote and foresee the absolute desperate need of Springfield to have an adequate highway system from Kansas City extending on to our east. The one do not is, do not allow the Federal Government to take away our user fee system of taxing fuel for other purposes. Thank you.

[The parepared statement of Mr. Kirkman appears on p. 1522.]

The CHAIRMAN. John Paul.

Mr. HAMMERSCHMIDT. Well, thank you, Mr. Chairman. Thank you, Mr. Kirkman for a good statement. I noticed that you said that you wanted us to fund programs on need, rather than not have any more demonstration projects. Usually, a demonstration project in surface transportation is initiated by a Member of Congress who knows his district very well, and it usually is based on need, even though it is called a demonstration project. Now, I give you as an example the $36 million that went into Highway 71 on the Missouri side; another $36 million on the Missouri side. I just mention that not to be argumentative, except we know that the need is there on Highway 71, and we used the demonstration project mechanism to leverage a little more Federal funds out of the highway trust fund into the system. So, I just make that comment. But, thank you very much for your testimony.

Mr. KIRKMAN. I appreciate that. Thank you.

Mr. HAMMERSCHMIDT. And, Peter Herschend, Mr. Chairman, is kind of a legend down in southern Missouri. They started the

Silver Dollar operation down there a number of years ago. And I tell you, it has grown—he told you how much it has grown, how many visitors they accommodate down there—1¾ million people in a year or season. But, if you went to Silver Dollar City, Glenn, and you got in that traffic, you would think that that gridlock, compared to the Santa Ana Freeway in L.A., you would be in the fast lane in the Santa Ana Freeway. [Laughter.]

Because it is unbelievable. And I am only sorry that this Committee—and Mel wanted us to do that, but we did not have time—is to go down there to Silver Dollar City and view for ourselves what fast-growing tourism does whenever you do not have the surface transportation infrastructure to accommodate it. So, you know, those of here locally are very well aware of your needs, and we appreciate your testimony, Peter, very much.

Mr. **Herschend**. Thank you, sir. Congressman, if I might add, I would commend the Highway and Transportation Department in the State of Missouri for the efforts they have made with very limited resources to solve the problem. The problem is, in fact, bigger than all outdoors, if you would. We are seeing—not we corporately, but the area—this year will see four million visitors—that is just—that is the number I can get a handle on that I can give to you accurately—four million visitors. And that will be up approximately 300,000, give or take a small percentage, over last year. That is the kind of growth that it is experiencing, and those are tremendous numbers. The economic impact, the social impact of those numbers long-term is just amazing.

Mr. **Hammerschmidt**. With all due respect to Mr. Kirkman, maybe we can get you a demonstration project. [Laughter.]

Mr. **Kirkman**. There are certain demonstration projects that are more important than others.

Mr. **Hammerschmidt**. Thank you very much, gentlemen.

The **Chairman**. I want to thank you, too. Your statements have been very interesting. Yesterday, in Tulsa, we saw an impressive display of what the private sector can do with the development of a river park. Now, what is the private sector prepared to do here to contribute to a strong infrastructure?

Mr. **Kirkman**. I think our private sector has always been available and ready to provide their share of projects whenever the framework is already laid through government efforts, Chairman Anderson, because I believe that the private sector does, through the form of significant taxation, as well as the willingness to make substantial investment in commercial projects in and around and on our infrastructure, such as highways and others are what they are prepared to do and traditionally have done.

The **Chairman**. Congressman Greg Laughlin.

Mr. **Laughlin**. I have no questions. Thank you very much.

The **Chairman**. Congressman Jim Inhofe.

Mr. **Inhofe**. Just an observation, Mr. Herschend. As you are using your numbers, I was trying to do some calculating. We learn to do that in Congress because they throw around some pretty big numbers. And if I am accurate, in the two counties that you are mentioning that you have referred to, your per capita income from tourism is approximately $20,000 a person. Now, I have to say that I have been there and I have seen this and I have observed that about half of those license plates come from Oklahoma. So, I think at least one member of this Committee here is making their contribution to your tourism.

Mr. **Herschend**. Thank you, sir. We appreciate you coming over.

The **Chairman**. Congressman Emerson.

Mr. **Emerson**. Thank you, Mr. Chairman. No questions. I just want to commend the gentlemen for their statements and to associate the very—that myself, my own sentiments with remarks of the distinguished gentleman from Arkansas, Mr. Hammerschmidt. I think you hit the nail on the head, John Paul, and I will not be redundant here. Thank you.

The **Chairman**. Thank you very much for your presentation.

Mr. **Herschend**. Thank you, sir.

The **Chairman**. Our next panel consists of Mr. Richard Sitton, Vice President of D. L. Sitton Motor Carriers; Mr. Glenn Brown, President of the Contract Freighters, Inc.; and Mr. Jim Wingfield, Vice President for Safety of Tri-State Motor Transit. You can take that order. Sitton first, Brown and then Wingfield.

TESTIMONY OF RICHARD SITTON, VICE PRESIDENT, D.L. SITTON MOTOR CARRIERS, JOPLIN; GLENN BROWN, PRESIDENT, CONTRACT FREIGHTERS, INC., JOPLIN; JAMES B. WINGFIELD, VICE PRESIDENT, TRI-STATE MOTOR TRANSIT, JOPLIN

Mr. **Sitton**. Thank you, Mr. Chairman. My name is Richard Sitton. I am the Executive Vice President of Sitton Motor Lines. We are a 48-state general commodity and contract carrier based in Joplin, Missouri. We are also here to beat the horse to death. We have a major—a major concern is the highway trust fund that is being held for government revenue reasons. I feel that this fund would be of better use on our highway system. This money is in a trust fund. I am worried that this fund will not be used for its intended use. The taxes were collected for highway construction and should be used for that reason. I think we have all covered this pretty thoroughly today, but I wanted to reiterate it.

We have a large investment in capital in our business. We have invested in new technology in all of our fleets. We run safe fleets. They get better fuel economy. They are safer units. And just like in our state, we have highway maintenance and construction. It is not normally thought of as a large asset to a trucking company, but it is a very large asset to a trucking company. Like any asset, when it sits idle, productivity of that asset falls. We want to compete with everyone in our business. We compete amongst ourselves. But to compete, we must have the best highway system that we can have available.

We all understand JIT—Just In Time—in our business. And to facilitate that, Joplin is meeting the great city of Fayetteville tonight in football, and we want to get around. So, I will answer any questions at the end of this.

The **Chairman**. Okay. Mr. Brown.

Mr. **Brown**. Mr. Chairman, Committee members. My name is Glenn Brown. I am president of Contract Freighters, Inc., a truckload irregular route carrier based in Joplin, Missouri. We operate in Canada and all 48 contiguous U.S. states and Mexico. We operate over 1,000 power units and employ over 1,400 people.

Most of our major concerns have been addressed to this Committee. Mr. Hancock mentioned our big concern we have for a north/south interstate route from Kansas City to Shreveport, Louisiana and on to Houston, Texas. Mr. Emerson pointed out the condition of our bridges in our state, a couple of which I personally cross frequently and hold my breath from one side to the other and fully expect to see them—that they have fallen down when next I see them.

I want to voice a loud and strong concern for the adequacy of the rest areas along our interstate highways. If you drive on any interstate highway at night, you will find it very difficult to find room to even pull into a rest area. It is virtually—it is vitally important for the truckers and motorists alike to have areas to rest at. It is not uncommon to see trucks and cars parked along entrance and exit ramps at night for lack of adequate rest areas. Some states will ticket a vehicle parked on a ramp when there is no other place for them. We suggest the construction of additional and larger rest areas along the interstate system to be a part of any future highway programs.

I would like to say that obviously, we do not support any increase in fuel taxes and would also like to tell you that we appreciate very much your efforts to release the highway trust funds so that they can be used for their intended purposes because we feel it is the right thing to do.

I would like to thank you again for the opportunity to express our concerns here today very much. Thank you.

The CHAIRMAN. Mr. Wingfield.

Mr. WINGFIELD. Mr. Chairman, I am Jim Wingfield. I am the Director of Driver Marketing in Tri-State Motor Transit. I am here to represent that company today.

I would like to say a few words about our operations. Tri-State has operated for over 50 years as an irregular route, heavy and specialized motor hauler headquartered in Joplin, Missouri. The company has grown to become one of the nation's top 50 trucking companies which operates from coast to coast and is one of the premier specialized motor haulers. Our fleet is supported by government and commercial explosives, nuclear materials, aerospace goods and, notably, heavy or over-sized/over-dimensional cargo. We have approximately 26 terminals located throughout the country, from the east coast to the west coast. Tri-State is one of the top transporters for the Department of Defense.

As regards my input to the Committee, I would like to address the longer and larger national scope related to our operations and then endorse a project which is very close to our operation at home. We endorse the view of the American Trucking Association supporting a highway system of national significance. And I think foremost in this position is maintenance and rebuilding of our interstate system, adding additional interstates where necessary.

As we all know, an historical justification for the interstate system was national defense, and as this company can certainly attest to, our national defense concerns were indeed served in the Vietnam conflict. And most recently, hundreds of loads of military cargo had been shipped per day by this company alone to support our military presence in the Persian Gulf. Certainly, maintenance of the interstate systems, which over the years have cost more than $13 billion to construct, must be paramount in our infrastructure needs, and we would underscore that.

On the commercial side, we would like to offer an illustration from our company's operations. We one of the foremost haulers in the areas of specialized over-dimensional commodities. And after researching the current highway system with our O.D. specialist at our company, we discovered that a rapid deterioration of the eastern seaboard interstate system is becoming more and more evident.

Some examples: our research indicated that in the past two years, Interstate 79 was shut to O.D. traffic at three points in West Virginia; Interstate 64 was shut to over-dimensional traffic in West Virginia; sections of Interstate 64 in eastern Kentucky cannot accommodate over-dimensional loads; sections of Interstate 70 rerouted and caused hundreds of hundreds of miles of detours; and there are many, many other examples.

Most of these restrictions have been recent, and they are the result of simple decay. And literally, some areas now of the northeast quadrant cannot be any longer reached with over-dimensional and specialized cargo. Our estimates are that we have to refuse 15-20 percent of shipping requests to those areas a week, thereby hampering midwestern and western shippers who would like to market their goods in the eastern seaboard regions.

By endorsing the basic purview of the ATA's call for a highway system of national significance, not only the interstate system could be enhanced, but other national arterial system routings could be justifiably improved as well. This aspect of the newly proposed highway program would allow for projects such as the Highway 71 four-lane project, which could provide a vastly needed north/south arterial route from south Texas to the Canadian border. This is a project near and dear to our hearts, given our proximity to that highway.

Due to heavy congestion on its two-lane portions and the lack of limited access, we refuse to use this particular artery south of Joplin for explosive shipments, even though it is an approved route. For safety concerns, we opt instead to utilize the Indian nation's turnpike in western Oklahoma, even though it results in costly hours out of route. For the same reasons and due to many older railroad overpasses and other overhanging structures, few over-dimensional over-height loads can be used on this corridor at all.

All of us who are involved in long-distance trucking, I think, in the area support the four-lane 71 project or the Interstate 59 or 49 project, as it is referred to down south. It is but one of several, though, other potential actual highway needs in the U.S. arterial improvement system, which could be affected under a new highway plan.

I would like to thank this honorable panel for the opportunity to express our interest, and we would be happy to answer any questions at this time.

[The prepared statement of Mr. Wingfield appears on p. 1550.]

The CHAIRMAN. When we talk about the quality of our Nation's infrastructure, we increasingly make reference to its impact on our productivity, growth and competitiveness. And as you see it, what is the condition of the infrastructure where you operate, and how does a strong infrastructure contribute to competitiveness and the sound economy in your situation?

Mr. BROWN. Well, the opportunity to operate increased size and weight equipment improves productivity and reduces cost to the ultimate consumer. The ability to be able to operate that larger equipment with improved infrastructure, there would be a lot of savings to the industry and the ultimate consumer. At the present time, the infrastructure available to the trucking industry is—restricts our ability to be able to maneuver that larger equipment within the communities. The interstate highway system accommodates the larger equipment with no problem. But, areas other than the interstate systems, where we have to get off for us to make our pick-ups and deliveries, are not adequate to accommodate larger equipment.

Mr. SITTON. I may add that it is not really the trucking industry that is going after the larger equipment. It is the companies that are trying to compete on the world market that are forcing us to get more competitive in being able to haul larger loads. A 40-foot trailer with a small truck would have been fine; but to maintain our competitiveness in the world, we have got to be able to be more productive in our ability to haul freight.

Mr. BROWN. The manufacturing of products in our country and the costs associated with transporting those products for export is much greater than, for instance, manufacturing a product in Japan and transporting it to an export point. The distances are greater; therefore, the need for manufacturers in our country to be able to compete in a world market, they need to improve productivity in transporting their product to points of export.

Mr. WINGFIELD. I would agree with those views, Mr. Chairman.

The CHAIRMAN. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Gentlemen, thank you for your testimony. I think it is important that we have the trucking industry here because certainly, they are one of the great users of a major part of our infrastructure system—the highways and particularly the interstate system, but all the highways. And you are also one of the great contributors monetarily to that system through user taxes.

Mr. WINGFIELD. Amen.

Mr. HAMMERSCHMIDT. And you know, but there is a big argument about whether that contribution is sufficient and not on—I do not think you would argue. I know what your position would be; but nevertheless, it is a matter of public debate. When you talk about twin 28 trailers or triples 28's as it relates to their impact on the system or safety either one, you are into a very sticky area politically for us to handle. And it is under debate, but there are many sides to that issue and just to tell you candidly, that is a tough issue for us to face. But nevertheless, we understand that the trucking industry is vital to this nation. It would not—it could not operate without it. And the better it operates, the better off the country is in productivity and in economic growth, so we very much appreciate the contributions that you make to this country with your industry and we appreciate you being here with your testimony this morning. Thank you.

The CHAIRMAN. Congressman Laughlin.

Mr. LAUGHLIN. Thank you, Mr. Chairman. Thank each of you for your input. Mr. Brown, I want to direct my question to you and preface a statement and a question by noting that your state and mine are among the lowest gasoline tax states in the Union. And along that line, highway users, everyone involved in the transportation in Texas tell me, "We strongly oppose the use of a gasoline tax to address the nation's budget deficit problems because traditionally and historically, the gasoline tax has been reserved for the states to take care of their highways and bridges." In your statement that you, I believe, said you strongly are absolutely opposed on increasing the gasoline tax. Is it along the lines of what I have talked about the historical and traditional use of gasoline tax being reserved for the state, or are you telling us you are opposed to increasing the gasoline tax under any circumstance?

Mr. BROWN. If the taxes were applied to the maintenance and the construction of highways, we would not have the opposition to an increased tax that we currently do just simply because of the use of that taxation in the past.

Mr. LAUGHLIN. Well, I concur with your statement then and should note that statistics consistently show that citizens in the south and west of our country drive substantially more miles per capita per year than those in other parts of the country. So, we would be paying a greater tax burden to resolve the budget deficit than those in the other parts when, in fact, we are more dependent upon public transportation routes. By that, I mean, the highways and not—we do not have a taxi service in my district. We do not have a subway in my district. And, we do not have commercial air service in my district, so——

Mr. BROWN. That sounds very much like our area.

Mr. LAUGHLIN. That is why those of you who are here interested in the economic welfare of your region are doing a good job, and we all have to work together to continue addressing this issue in that way. Thank you very much.

The CHAIRMAN. Congressman Mel Hancock.

Mr. HANCOCK. I do not have any comment. I have visited with these gentlemen from time to time, and they know that they have access to me any time they want to have input when we are in Washington, so I will—in the interest of time—defer. Thank you.

The CHAIRMAN. Thank you.

Thank you very much for your presentations.

Our next panel, we will hear from Mr. Duane Galloway, Assistant to the General Manager of Springfield City Utilities and from Mr. Max Cates, Director of Communications and Marketing of the Associated Electrical Cooperative, Inc. here in Springfield. Mr. Galloway, I believe you are first.

TESTIMONY OF DUANE GALLOWAY, ASSISTANT TO THE MANAGER, SPRINGFIELD CITY UTILITIES; MAX CATES, DIRECTOR OF COMMUNICATIONS/MARKETING, ASSOCIATED ELECTRIC COOPERATIVE, INC., SPRINGFIELD

Mr. **Galloway**. Thank you, Mr. Chairman, members of the Committee. My name is Duane Galloway. I am Assistant General Manager at City Utilities, the municipal utility that serves the City of Springfield. We are certainly glad to have you in our fine city today.

I will take a couple of minutes to comment on our interest in the infrastructure problem. We have a long-range planning process where we identify needs for at least ten years into the future. And one of those needs we have identified for the mid- to late-1990s is a long-term water supply. We have finished the preliminary work on this project, and we anticipate spending about $80 million to come up with a new source to serve our needs for the next 50 years.

We, of course, have a number of problems in financing a project of this type and building a project of this type for our community. One is that we have a water utility that has revenues of under $15 million a year for an $80 million project, and we are not anticipating any federal assistance in building the project. Although, Mr. Chairman, I might tell you that if you would be willing to help us, I am sure our Board would consider your offer.

A second problem we have is that we are being forced to meet new federally mandated water quality standards. They are costly; but, I would say that we do not object to them. And generally, in the past, we have done much more testing than is required, and we have always put out a product that is—that fore meets and exceeds the standards that are required, and we will continue to do that.

The area that I would like to ask your assistance on—I understand that you do not write the tax laws; but I—when you discuss infrastructure problems with your colleagues that do, we would appreciate you emphasizing that they are making our job much more difficult in restricting the use of our tax-exempt bonds. And we—that is one area that we could suggest that you could help our communities meet their infrastructure needs in lessening some of the restrictions that have been placed on the traditional uses of tax-exempt financing.

I would like to make a couple of brief comments on our electric utility. City Utilities has the water, natural gas, electric and public transit for Springfield. Public power, municipally owned electric utilities have been around since the very beginning of electric production in our nation. We have the oldest public power system in the nation in Missouri. We typically serve smaller communities. Springfield is a relatively large public power system. The average—the median system is under 1,700 customers. We are locally controlled, locally owned and the electric system is integrated in with the other services that our communities provide, in that, we typically use the electric facilities to assist in other areas.

One of those areas that is of potential concern to you is our transit system. I have Cathy Meyer, one of our Senior Managers here this morning, who is responsible for the transit system utility to answer any questions you might have on our transit system. I will tell you that our transit system—our revenues fund about 13 percent of the expenses of the transit system. We have had a longstanding federal, local partnership in meeting our needs—this vital public service to our community with our bus system. We support the American Public Transit Association's position on transit funding, and I think I can sum up that position in saying we need a larger federal participation in that area, if at all possible.

On our electric system, I might just add that since there has been tax-exempt financing of anything in the nation, public power systems have used that means to finance our capital intensive projects.

I will be happy to answer any questions anyone has, Mr. Chairman.

The CHAIRMAN. Mr. Cates.

[The prepared statement of Mr. Galloway appears on p. 1490.]

Mr. CATES. Thank you, Mr. Chairman. I am Max Cates from Associated Electric Cooperative, headquartered here in Springfield. It is certainly a pleasure to join you here today to discuss federal hydropower as it relates to the economy of rural Missouri.

As a power supplier for 40 electric cooperatives in Missouri and three in Iowa, Associated serves approximately 1.2 million rural consumers.

Hydroelectric power from federal dams, which is sold as preference power to electric cooperatives and municipal utilities, has been the salvation of the rural electric program in our territory and in many other areas of the country. In fact, low-cost federal power brought and continues to provide electricity to many sparsely populated areas of the United States. Missouri's electric cooperatives average only 4.3 consumers per mile of line, compared to investor-owned utilities, which average 30 consumers per mile of line. Hydropower helps offset the cost of providing service to these remote, low-density areas.

As a matter of fact, if the 41 rural electric cooperatives in Missouri did not have access to federal hydropower, it would have cost us $40 million more to provide service to rural Missouri. The absence of hydropower could substantially increase rates to rural Missouri.

Because of our reliance on hydropower to help us affordably serve our low-density rural areas, we are very interested in H.R. 5314, the Water Resources Development Act of 1990, recently voted out of your Committee. It would authorize the development of water projects by the Army Corps of Engineers.

We strongly urge support for Congressman Tim Valentine's effort to improve language in an amendment titled "Changes in Reservoir Project Operations" that was one of the en bloc amendments accepted in the full Committee mark-up. We understand Mr. Valentine is attempting to make the House language more closely resemble Section 308 of the Senate Water Resources Act, S. 2740. We strongly support Section 308.

The Senate Section 308 language first establishes a broad public participatory procedure for the Corps of Engineers to use in establishment of water control plans. Number two, it requires the corps to determine if a proposed operational change at a project is consistent with Congressionally authorized purposes. And Number three, it instructs the corps to seek congressional authorization for any water control plan which is not consistent with congressionally authorized cost-benefit analysis.

One final note on federal hydropower—as a customer of the Southwest Power Administration, we support its need to maintain financial integrity. However, we are not in support of Southwest Power Administration's 1990 Power Repayment Study which would result in a 17 percent rate increase for us. We would encourage a phased in rate increase, which would allow an accurate validation of Southwest Power Administration's expenses, especially operation and maintenance expense. A gradual approach would also soften the rate impact on our rural consumers, who are already faced with numerous other economic problems.

In summary, I would like to emphasize the importance of federal hydropower in helping rural communities survive. Anything that detracts from the hydroelectric operations of federal projects places a severe burden on our rural communities. Hydropower and recreation can co-exist successfully; but, there is a large price to pay if we underutilize the hydropower purpose of federal projects. We hope that the U.S. Congress and the Administration will maintain the integrity of the federal hydropower program and perpetuate its original intent of supplying low-cost power to rural consumers who need it most.

Gentlemen, thank you for your time and your concern for rural Missouri.

[The prepared statement of Mr. Cates appears on p. 1468.]

The **Chairman**. Mr. Laughlin.

Mr. **Laughlin**. I have no questions. Thank you very much for your input.

The **Chairman**. Mr. Hancock.

Mr. **Hancock**. Here again, Mr. Chairman, in the interest of time, I have the opportunity to visit both of these gentlemen regularly. I had lunch with Mr. Cates just the other day, so I will talk to them on a personal basis. Thank you for coming.

The **Chairman**. Mr. Inhofe.

Mr. **Inhofe**. No questions, Mr. Chairman.

The **Chairman**. Bill Emerson.

Mr. **Emerson**. No questions. Thank you, Mr. Chairman.

The **Chairman**. Well, thank you very much for your presentation.

Our next witness will be Mr. Roger Howard, Executive Director for Government Affairs of the Burlington Northern Railroad. Mr. Howard, you are first.

TESTIMONY OF ROGER W. HOWARD, EXECUTIVE DIRECTOR, GOVERNMENT AFFAIRS, BURLINGTON NORTHERN RAILROAD

Mr. **Howard**. Thank you, Mr. Chairman. I am pleased to have this opportunity to discuss the positive role our company and the rail industry can put in effecting a solution to the congestion and deterioration of the nation's publicly financed infrastructure.

In recent years, our company has worked hard to establish a solid partnership with our companies. In certain instances, our customers that we work with are truckers. We value their business, and we want to maintain our good working relations with them.

We have made dramatic improvements in the handling of carload and door-to-door intermodal shipments. We believe such partnerships offer a positive solution to the problems facing our publicly owned and maintained infrastructure.

In order for this partnership to thrive, we need an efficient network of local highways for pick-up and delivery to complement our long haul rail service. Together, we can provide the shipping public with the most cost-efficient and environmentally sound and safe transportation system possible.

Other witnesses here today, I am sure, have spoken of the positive aspects of their modes of transportation. Let me speak of some of the virtues of the railroad industry.

We are fuel efficient. We use only 2.2 percent of the total fuel consumed on all transportation modes. And we can haul almost three times more ton miles per gallon of fuel than can trucks.

And we are environmentally preferable. Scarcity of land and environmental concerns are obvious reasons why massive amounts of new highways cannot be added in many instances. Because we are more fuel efficient, we contribute less to air pollution. Because we move on steel, we do not create the environmental problems associated with rubber tire wear and tire disposal.

We have excess capacity. In 1989, we hauled a trillion ton miles—a record for our industry. And we have the capability of hauling many times that. Through innovations of technology utilizing telecommunications and satellite tracking, we can increase the capacity of our main line track by as many as three times. By adding parallel tracks, we can increase that capacity by as much as six times. And this can all be done without the land acquisition and the environmental problems common to highway construction.

And railroads have both an outstanding both employee and a safety transportation safety record. We are the only freight transportation system that bears the full cost of construction and maintenance of its infrastructure, and we pay property taxes on that infrastructure.

Although we have emerged from Staggers a healthier industry, transitioning from a tightly regulated environment to a customer-driven marketplace, we continue to face a threatening and competitive marketplace. Skewed by a national policy subsidizing competing modes, government policy continues to exert a profound effect on how the marketplace distributes freight among the various transportation modes. Our company and the rail industry has invested substantially in providing intermodal service to our customers. Continued and/or increased governmental policy preference to other modes will seriously jeopardize our ability to compete in the marketplace. Railroads currently operate at a severe competitive disadvantage, while public policy distorts the transportation choices and reduces the overall efficiency of freight transportation. Truck diversion of rail traffic has slowed as railroads have improved service, consistency, reliability and innovation. Our intermodal technologies are accelerating, and we look forward to justifying our investment in these technologies and achieving our potential marketplace and potential market share.

Today, we offer a solution to the public infrastructure problems. And with your positive consideration, we seek to avert the crisis that is facing our private rail infrastructure.

I have—go ahead, sir.

[The prepared statement of Mr. Howard appears on p. 1518.]

The **Chairman**. Thank you, Mr. Howard. Now, while our Committee technically does not have jurisdiction over railroads as such, there is a direct relationship between what you do and our Nation's infrastructure. Now, how important is that relationship, particularly to your ability to be productive?

Mr. **Howard**. Obviously, the Committee studies and makes recommendations and votes on issues that does affect the competing modes within our Nation's transportation system. And, I have heard testimony here earlier today concerning heavier weights, longer combination vehicle trucks. Those are things that are of concern to our industry.

The **Chairman**. Mr. Laughlin.

Mr. **Laughlin**. I have no questions. Thank you very much.

The **Chairman**. Mr. Emerson.

Mr. **Emerson**. No questions, Mr. Chairman. But, I do appreciate your comments, Mr. Howard, and I am glad that you are here with us today.

Mr. **Howard**. Thank you.

Mr. **Inhofe**. I have no questions. Of course, Mr. Howard, your company has a presence in my district, too, and I was very interested in your comments. Thank you.

The **Chairman**. Thank you very much for your presentation.

Mr. **Howard**. Thank you, Mr. Chairman.

The **Chairman**. And our next group of witnesses will include Mr. Walt Wildman, Associate Director of Interstate 66 Project, Inc.; Mr. Josh Bill, Chairman, and Mr. Blair Moran, Secretary/Treasurer of the Highway 60 Committee; and Mr. Laurel Thompson, Chairman of the Presentation Committee of the Highway 63 Committee. I would like to note that these gentlemen are from Congressman Bill Emerson's district.

Mr. **Emerson**. Mr. Chairman, would you yield to me before they begin just for a very brief comment.

The **Chairman**. Any time. Go ahead.

Mr. **Emerson**. Thank you, Mr. Chairman. I want to say that we have two panels here today from the 8th District to talk about 8th District's—the 8th District's most vital concerns. The first panel here is going to address itself to highway issues. They are going to talk about our highest priority highway issues. And the next panel will discuss some of our concerns relating to flood control and the Mississippi River and tributaries project. And we are nearing the end of the hearing here this morning; but I just wanted to call to your attention, we have made every effort here to organize these panels so they may present their statements in a brief, yet pungent manner, and not take a great deal of the time of the Committee. But, these are very important witnesses with us here today.

I thank you for your indulgence.

The **Chairman**. Thank you, Bill.

Gentlemen, you may begin when ready, and I have you listed in the order of Wildman, Bill, Moran and Thompson. You can take that order or your own order.

TESTIMONY OF WALT WILDMAN, ASSOCIATE DIRECTOR, INTERSTATE 66 PROJECT, INC.; JOSH BILL, CHAIRMAN, HIGHWAY 60 COMMITTEE; BLAIR MORAN, SECRETARY/TREASURER, HIGHWAY 60 COMMITTEE; LAUREL R. THOMPSON, CHAIRMAN, PRESENTATION COMMITTEE, HIGHWAY 63 COMMITTEE

Mr. **Wildman**. Well, thank you, Mr. Chairman and Committee for this opportunity. Thank you, Congressman Emerson, for your comments.

In the three minutes I will try to stay with, I am going to talk about a project that would entail 2,400 miles of interstate highway standard construction. The effect of this highway on the United States and its intermodal potential is great. I am sure you understand that three minutes is not quite sufficient to get into too much detail. Suffice it to say that we recognize that this type of project will, in fact, require the combined efforts of the Federal Government, state government, local government and even private investments. And as this project progresses, we will begin to see an overwhelming positive impact on the United States' potential, which makes all this effort worthwhile.

The I-66 Corridor, as we call it—the I-66 is the term we use to identify it. As I mentioned, it is a 2,400 mile corridor stretching from California to Washington, DC. The potential of economic impact for such a corridor and the effect on international trade is astounding. I will refer to my printed testimony for the details.

One thing I would like to point out, in reference to economic impact is that the northern route option of this proposed I-66 is anticipated to experience an economic impact in excess of $303.7 billion. Plus, a construction impact of $62.7 billion. And the southern route option would create a $281.5 billion impact. And the construction impact would be $64.5 billion. That is a significant gain and illustrates the benefit of adequate highway corridors to GNP.

Considerably more detailed information is available and can be obtained from the working paper or pre-application that we submitted last winter and two video presentations, either one of which would be available to this Committee as individuals or as a group. Thank you.

[The prepared statement of Mr. Wildman appears on p. 1545.]

The **Chairman**. Mr. Bill.

Mr. **Bill**. Mr. Chairman, once again, in the interest of time, I defer to my colleague, Mr. Moran, to read our joint statement. I am here to support him in answering any questions, should there be any.

The **Chairman**. All right. Mr. Moran.

Mr. **Moran**. Thank you, Mr. Chairman. I appreciate the opportunity to appear before you today to express our concerns on the topic of federal highway policy.

I live in Sikeston, Missouri, in the southeastern corner of the state, and we have been waiting for 30 years for the completion of a four-lane corridor across the southern tier of this state.

For the record, I would like to point out that this section of south central Missouri and north central Arkansas is the largest area in the eastern two-thirds of the United States not served by an interstate highway. This situation is compounded by the fact that we also have no state four-lane highways through this region.

Study after study on the topic of economic development concludes that businesses expand only along transportation arteries. So, it comes as no surprise that this region of ours also contains some of the poorest counties in the country.

When others tell you that the interstate system has been completed, we would ask that you remember that some regions, such as ours, have been left behind. We do not need or ask for an interstate; but, we would like the Committee to realize that new construction is desperately needed.

In addition, we would like to offer the following thoughts as the subcommittee prepares to rewrite the highway bill.

An increase in the local matching requirements would be devastating to the poorer states without the tax base to generate these resources.

The Committee could greatly assist regions like ours by offering an alternative formula for projects in areas with high concentrations of poverty. This might help counter the distortions we have seen in our state where organized urban state legislative delegations have secured a disproportionate share of the federal funds allocated.

You can argue that being a rural community in a minimum allocation state is the worst of all possible worlds with respect to the federal formula. After our state receives its disproportionately low share, the urban areas grab a disproportionately high share, and we are left with the bare minimum.

Mr. Chairman, we have many people in this region who know all about hard work. But, the jobs are not coming here like they should because there is no acceptable transportation network. Our idea of welfare reform is to create more jobs, but we need some basic investment in our highway system to bring those jobs that will build our future.

Thank you once again for your invitation and kind attention.

[The prepared statement of Mr. Moran appears on p. 1530.]

The CHAIRMAN. Mr. Thompson.

Mr. THOMPSON. Thank you, Mr. Chairman, Congressmen. I feel a little bit overwhelmed. I think they have brought the mountain to Mohammed, and I certainly appreciate the opportunity to be here and to present testimony to this Committee. We have submitted written information supporting two primary areas of need.

First, the need for long-range planning for completion of upgrading to four-lanes. The truckers' apparent route of choice from cities like Omaha and Kansas City through Springfield and West Plains, Missouri to Jonesboro, Arkansas, Memphis, and points south and southeast. This diagonal artery has been talked about for a lot of years. It would interconnect at least four major north, south, east, west interstates and obviously would be a highway of national significance.

Secondly, we continue to search for any possible source of help in addressing the immediate problems of the most severely overloaded portion of that corridor, U.S. Route 63 between Willow Springs and West Plains, Missouri. Even though the northeast—or the northwest/southeast corridor has been long talked about and the affected states have attempted to treat the most urgent needs, needed federal priorities, coordination and planning have not been present.

In our presentation, we pointed out examples of area growth, even though we are off the beaten path. Retail sales in our county increases of 10 to 12½ percent annually. Employment in Howell County dipped to 4.9 percent this summer. Our hospital, Ozark Medical Center of West Plains, had 37 percent growth in utilization in just one year in the latter part of this past decade These and other numbers are not speculation. Our area growth is here and still exploding, also creating traffic growth far exceeding most liberal predictions along this 20 miles of U.S. 63.

The combination of unexpected heavy traffic loads, traffic tie-ups, terrain and topography have provided a dangerous combination of factors not really present in any other two-lane routes that we have been able to locate; 28 percent of vehicles are heavy trucks, 34 percent of this 20-mile stretch is yellow-striped no passing zones. And in much of the area where passing is legal, the short distance available, the traffic load and congestion prohibit it.

The latest traffic numbers indicate a 10 to 12 percent growth from just 1988 to 1989. The count on this 20-mile stretch now reaches 8,000—from a low of 8,000 vehicles per day to almost 16,000 vehicles on a single-lane highway just north of West Plains.

This year, as school started, we surveyed and found that the schools along this portion of U.S. 63 have a total of 38 buses moving on or across U.S. 63 each day. Assuming an average of 30 to 40 students per bus, these movements constitute what we feel is an unacceptable risk factor for tragedy. The Missouri Transportation Department has been working with us very closely. They do have plans to address the most urgent needs just north of West Plains, but at least half of this 20-plus miles, plus a critical railroad crossing problem at Pomona, Missouri—they are all in the unfunded ten-year study.

To help our U.S. 63 immediate needs, we would hope that we might find some faster, even immediate federal help with a special project through the highway trust fund. If no such emergency system is currently available, we would urge Congress to seriously work toward the inclusion of such mechanisms in the new federal highway bill.

The people in our area have worked very hard to pull themselves out of the economically depressed column, only to have their efforts and result in success threatened by the stifling effect of 20 miles of outdated, horribly overloaded and dangerous highway. We feel we have the need for one of those demonstration projects.

Mr. Chairman, we appreciate your time and consideration of our submitted evidence and testimony.

[The prepared statement of Mr. Thompson appears on p. 1541.]

The CHAIRMAN. Well, thank you for your informative statements. I notice you have all mentioned specific highway projects. Now, how are these critical in bringing economic development to the area and in increasing overall productivity in the state?

Mr. **Thompson**. In our particular area, I might point out that we—I serve as the current President of the West Plains Industrial Corporation. I am a representative of the Chamber of Commerce and a private businessman in the area. We have not sought out new industry now for the past couple of years through our IDC. We are trying to serve those industries we do have.

But, we have been approached very recently by a high tech manufacturer from your state of California, who tells us that he is bringing 20 small- to medium-sized companies to north central Arkansas and south central Missouri. We are also working with a high tech firm out of Canada also with offices in the United States, talking in terms of alternate fuels, conversion of wood waste to energy, et cetera, that is talking in terms of a couple of hundred new employees along the middle part of this route we are talking about. I think most of that is addressed in the written testimony.

We find it very, very difficult. We are seeing a rash of heavy truck accidents, the mixing of ag traffic, along with the heavy crush of truck transport on a two-lane highway where a vehicle just cannot pass. It is becoming a very tragic time bomb.

Mr. **Bill**. Mr. Chairman, if I could add to that——

The **Chairman**. Mr. Bill.

Mr. **Bill**. If I could add to that response. Both in terms of the studies that we have seen. I am active in economic development in my community of Sikeston, Missouri. The studies that we have seen indicate that all manufacturing relocation decisions are made within—or virtually all are made within a 25-mile distance of an acceptable four-lane artery. We have—that is coupled with a specific experience in the state of Missouri, where we have been told by the State Economic Development Department that all of the new industries or businesses moving to Missouri are not interested in locating anywhere other than on the interstate arteries or an acceptable four-lane divided highway. They have—obviously, have to get their products to market, and they are not going to bring jobs to areas that do not have service from those arteries.

The **Chairman**. Mr. Hammerschmidt.

Mr. **Hammerschmidt**. Thank you, Mr. Chairman. Gentlemen, we thank you very much for your testimony. Your testimony is more complete and rather comprehensive, but it just reiterates what Bill Emerson and Mel Hancock have been telling us on the need for 66 and 63 and 60 improvements. And, you know, we are very familiar with it because of their input, but we are a lot more familiar with it now, and we appreciate your testimony very much. Thank you.

The **Chairman**. Greg Laughlin.

Mr. **Laughlin**. Thank you, Mr. Chairman. I want to thank each one of you for your testimony today. You have addressed some issues that many people are totally unaware of the existence of inadequate transportation in major parts of our country. It is indeed a great thing to have the interstate system, and it was very needed at the time and addressed many of the needs at the time. But, that was designed back in the 1950s. It took 30 years to get it constructed, and we are very pleased to have it. But, your area is very much like mine. There are major gaps. And when you look at the road system and as each of you have addressed, trying to attract desirable economic development to your area to help out on the tax base, you cannot attract them when you do not have transportation. So, you are pointing out needs. We need to fill in those gaps. And I am pleased to hear your testimony along those lines. Thank you very much.

The CHAIRMAN. Bill Emerson.

Mr. EMERSON. Thank you, Mr. Chairman. I will not belabor the point here. I hear from these people a lot. I want to say that I look forward to working—continuing to work with them in reflecting to the Committee the views that have been expressed here as we move towards work on this very important reauthorization of the Highway Act next year. These two panels represent, Mr. Chairman, in my view—the one on highway needs and the one on our flood control and water control issues—two of the most significant issues—economic-related issues affecting southeast Missouri. They are issues that we cannot possibly deal with on our own without federal assistance. And, with the right kind of federal help, we could achieve a great step forward in terms of economic development for which all of our people are looking.

And so, I am delighted that these two panels, in particular, have had the opportunity to be here today so that the distinguished members of this Committee and the staff of this Committee could hear first hand what they have to say. Thank you.

The CHAIRMAN. Congressman Inhofe.

Mr. INHOFE. Mr. Chairman, thank you. I have one question, and that is—I am very much impressed with your titles of 60 Committee and 63 Committee. How structurally do you work these? I know what your mission is—to promote the improvements and the development of those areas. But, is this done through some type of a state agency? I suppose I should have known this before coming here. When you talk about the Highway 60 Committee, how is that structured?

Mr. BILL. Actually, sir, I can speak for the Highway 60 Committee. This came into being spontaneously at the local level. And I have had a number of meetings with members of the Missouri Transportation Development Council, which is a network organization at the state level. And I believe their experience has been that the committees formed along the corridors of greatest need, again, as identified by local citizens. Really, each have come together spontaneously. We contacted MTD or were contacted by them after we came into existence. I defer actually to Mr. Moran, who was the instigator of the start of our committee in our area, and we have now formed working alliances in groups with communities along the corridor. This stretches across southern Missouri. But, it was spontaneous combustion, if you will, because we all recognized the need. I cannot speak to the other committees; but, I can tell you that that is——

Mr. INHOFE. But, you are coordinating the efforts. You can look at your priorities and have everyone decide this and decipher the needs along these corridors. See, maybe you are assuming this happens all over the country; but, it really does not. I am very much impressed with how well coordinated you guys are in putting your act together.

Mr. BILL. A lot of the leadership, I think, has to be given credit to the Missouri Transportation Development Council and our Highway Department and the Highway Commission. We worked closely with them, and they have been very encouraging of our efforts, of course, within limits because they face the same kind of constraints you have heard of. But, they have been very helpful to us and kept in constant communication with us, keeping us apprised of what the prospects are and what needs to be done on the state level, now, in terms of raising additional state revenues.

Mr. **Inhofe**. Well, Mr. Chairman, I think this is—this makes our job easier when you are listening to someone who has coordinated a concern and put it in some type of an entity where they express themselves on behalf of the whole system. I think I have learned a lesson to take back to Oklahoma.

Mr. **Bill**. A lot of credit for that goes to our Chief Engineer, Wayne Muri, but you cannot have him.

The **Chairman**. Well, thank you very much for your presentation.

And our final panel members, also from Bill Emerson's district, include Mr. Dave Brewer, a member of the Birds Point/New Madrid Floodway Study Team; Mr. Lester Goodin, also a member of the Birds Point/New Madrid Floodway Study Team and President of the Buffalo Bend Levee Association; and Mr. Ralph Boyer, Presiding Commissioner of Scott County, who has been active in the St. Johns Dry Bayou Project. Gentlemen, please be seated, and you can take that order if you wish, Brewer, Goodin and Boyer, or change it any way you wish.

TESTIMONY OF DAVID B. BREWER, MEMBER, BIRDS POINT-NEW MADRID FLOODWAY STUDY TEAM; RALPH BOYER, PRESIDING COMMISSIONER, SCOTT COUNTY, ACTIVE IN ST. JOHNS DRY BAYOU PROJECT; LESTER W. GOODIN, PRESIDENT, BUFFALO BEND LEVEE ASSOCIATION, MEMBER, BIRDS POINT/NEW MADRID FLOODWAY STUDY TEAM

Mr. **Brewer**. I will start, if that is all right. Mr. Chairman, members of the Committee. I have been assigned the task of discussing the ability to pay provision associated with water resource projects in the economically depressed Mississippi River Delta Region.

Mississippi County is one of three counties in southeast Missouri that will benefit from a flood control project known as the St. Johns Bayou/Birds Point-New Madrid Floodway Project. The project was authorized by the Congress in the Water Resources Development Act of 1986.

I am going to tell you that we have got problems.

The St. Johns Bayou-New Madrid Floodway Project is a good project and one that would save more than $8.5 million in flood damages annually to a large tri-county area of the State of Missouri, which happens to be the northernmost portion of the Mississippi Embayment, the geological feature associated with the Mississippi River Delta. The area is fundamentally rural and is economically depressed.

The project would also provide fish and wildlife mitigation lands preserving our environment and increasing habitat for wildlife. Most of this land has been cultivated for more than 100 years. The project will not drain wetlands; it will allocate additional lands for wetland management.

At the moment, we have two distinct drainage basins created by the construction of the Birds Point-New Madrid Floodway in the 1930s. A setback levee divides the two basin.

Backwater enters a 1,500-foot gap between the setback and frontline levees near New Madrid during relatively minor floods on the Mississippi River. The water drains out pretty well as soon as the river drops, but backwater flooding does get to be expensive and limits development in that area. In fact, at times, they have to close Interstate 55 because of the backwater flooding south of Sikeston.

As far as the St. Johns Basin is concerned, all of that portion behind the setback levee drains only through six 10x10 foot gates in the setback levee near New Madrid. Local water gets impounded behind the levees often and floods portions of Scott, Mississippi and New Madrid Counties for long periods of time.

The project involves improving rural and urban channels in Mississippi, Scott and New Madrid Counties and the construction of two pumping plants, one to serve St. Johns Bayou area of the three counties and a second for the Birds Point-New Madrid Floodway.

In a related project authorized in the 1950s and expected to be funded federally, the 1,500-foot gap in the levee would be closed.

The project includes the purchase of 2,500 acres of land in the Ten Mile Pond area and development of two greentree reservoirs there for mitigation. The sump area of each of the pumping stations would be allowed to flood each year for migratory waterfowl, allowing a total of 775 acres of woodland and 4,129 acres of cropland to flood each year after harvest. This would provide migratory waterfowl nesting and feeding areas.

Latest total construction costs are estimated to be more than $77 million, including flood control and fish and wildlife mitigation, with $30.5 million being the non-federal cost. Of that amount, the estimated non-federal cash up front of construction costs will be $3.85 million.

The operation, maintenance and replacement cost for the project as estimated by Corps are $558,000 annually. Of that amount, $530,000 is the annual cost of the flood control features alone.

We have two primary sponsors, the St. Johns Levee and Drainage District and the St. John's Bayou Basin Drainage District. We also have seven other sponsors, including the City of Sikeston, the Missouri Department of Conservation, two county commissions, Levee District Number 3, Consolidated Drainage District Number 1 of Mississippi County and St. James Drainage District of Missouri, all of which have some jurisdiction over physical improvements to the land in specific portions of the project.

We do not have an umbrella district formed to identify benefits or levy taxes to meet expenses. We have been looking locally at the possibility of enlarging St. Johns Levee and Drainage District and reassessing benefits, bringing in more money. However, St. Johns only raises $70,000–80,000 annually. Even with an enlarged tax base—even if we double the tax base—they still will not be able to take care of the current obligations and operate and maintain those pumps. The other primary potential sponsor, St. Johns Bayou Drainage District, raises $24,000 annually.

As I said, the local cost share requirement for this project, including the purchase of mitigation land, is more than $30 million. Operation and maintenance is expected to be $558,000 annually.

We do not know where we can come up with that kind of money.

For one thing, according to Missouri statutes, a Levee or Drainage District can only tax up to ten percent of the cost of the original construction of that district in one year. Many of the districts are taxing at or near this level at this time. There is no way we can float bond issues when we cannot increase our revenues to pay off the bonds. It is an unfortunate fact of life that most local subdivisions are scraping the bottom of the barrel now to meet existing obligations.

In summary, the St. Johns Bayou-New Madrid Floodway Project is one we have longed for and worked toward for more than 20 years—it is not pork barrel. It is a good project supported by all agencies involved. The kicker, after all this time and study, is we, the local interests, cannot afford to build it if we must pay five percent of the cost of construction up front and 40 percent of the total cost. And even if did miraculously get it built, we could not afford to operate, maintain and replace it. We do not know where we can come up with that kind of money. That is the problem facing citizens residing in the Mississippi River Delta. We have to live with the river as best we can. And the water in that river comes from 41 percent of the contiguous 48 states and portions of Canada.

We would like to go on record in support of Section 12 of H.R. 5314, the Water Resources Development Act of 1990, and in total opposition to Section 15 of that same proposed Act. Section 12, we understand, would give us some relief concerning cost sharing requirements, while Section 15 will effectively block any development within the 100-year floodplain.

I have included a copy of Section 15 for your reflection.

Thank you all.

The CHAIRMAN. Now, your entire prepared statement will be made a matter of record, and I would remind the other witness to perhaps paraphrase for the sake of time. So, I guess Mr. Goodin is next or Boyer, either way. Mr. Boyer.

[The prepared statement of Mr. Brewer appears on p. 1461.]

Mr. BOYER. Chairman, gentlemen. My name is Ralph Boyer, and I am the Associate Commissioner for Scott County, Missouri. I am here today to discuss the issue of flood control as part of our very critical infrastructure needs.

In particularly, I have been actively involved in trying to help make progress on the St. Johns Bayou Flood Control Project. This project, which was authorized by Congress in the 1950s and then authorized for implementation in the Water Resources Development Act of 1986, calls for the construction of two pumping stations which would serve three counties, more than 140 miles of channel improvements and the purchase of almost 7,500 acres for mitigation efforts. I might add that the plan has tremendous potential for serving migratory waterfowl, and thus would provide the added benefit of a valuable wetland area for environmental needs.

This is a vital infrastructure need for Scott County and one that will enable us to control flood waters and attract economic development, businesses, jobs and ensure stable transportation routes in the area, while also playing a role in helping our environment. In short, this is a very worthwhile project and one that enjoys support from everyone involved.

The overwhelming problem that our community faces is that over the 20 years that we have been trying to start this project, we simply have not been able to come up with the local cost share, that is, some $33 million. A bond issue is out of the question in rural Scott County because we would be unable to pay it back. Nonetheless, this project is desperately needed to control the flood waters of the Mississippi River, and the costs continue to grow even further out of reach.

The Water Resources Act, which the House Public Works and Transportation Committee recently adopted, contains a provision which may be of some help to us. Section 12 of this legislation gives the Army Corps of Engineers the flexibility of reducing the local cost share requirements to take into account situations very much like the one I have just described—one where the local community is in great need, but cannot afford the up-front capital costs. I cannot emphasize strongly enough how important this section is, not only to St. Johns Bayou Project and to Scott County, but to numerous other flood control projects which are not represented here today.

Mr. Chairman, in short, we have long needed help for the cost of bringing our county's infrastructure up to par. Your Committee has provided an avenue which is a good start for us to make long overdue progress. The rest of this country may take for granted that their excess rain water drains away and never floods their cities and towns. But I can tell you where almost half of that water winds up. The Mississippi River provides a basic service that goes largely unnoticed, except for those who live near her shores. If we can control this flooding, we can ensure our community will grow strongly into the future.

Thank you.

The CHAIRMAN. Mr. Goodwin.

[The prepared statement of Mr. Boyer appears on p. 1459.]

Mr. GOODIN. Mr. Chairman, I am Lester Goodin. I am President of Buffalo Bend Levee Association, which is a private—small private levee association in Mississippi County, Missouri. And I have a most urgent problem. You are examining our nation's—the future of our nation's infrastructure needs. Yet, I come from the Mississippi Delta and represent an area that is specifically and, by definition, excluded from consideration for any infrastructure improvement. That is the entire Mississippi Delta.

If I may direct your attention to Section 15 of House Resolution 5314, entitled "The Water Resources Development Act of 1990." To summarize this bill's specific instructions, no area within the 100-year floodplain may be included—and I am quoting here—"may be included in the benefit base for justifying federal flood damage reduction projects." Gentlemen, this means that virtually the entire Mississippi Delta is effectively and forever excluded from further development of its infrastructure since virtually the entire Mississippi Delta is within that 100-year floodplain. We must participate in that.

Yet, if House Resolution 5313 becomes law, such projects will be impossible to justify almost anywhere in the Delta. Therefore, I urge that this resolution, which has been reported out of Committee and, I understand, is before the full House, is critically flawed, and I urge its reconsideration.

If I may add, on a more personal note, it is my understanding, gentlemen, that this—the specific language of Section 15 was drafted by a Mr. J. Hair, who is President of the National Wildlife Federation. His narrowly conceived agenda in drafting this language is, in my opinion, what gives the so-called "environmentalists" a bad name, and I resent it very much. Gentlemen, I am an environmentalist. We are environmentalists. We are conservationists. We believe in a strong and a clean country.

For example, my small Buffalo Bend Levee Association has in the past four years planted over 100,000 trees for erosion control and wildlife area on private land, privately done—100,000 trees. Mr. Brewer is President of Levee District Number 3, and I am a Board member. We have planted over 80,000 trees on public land, which we have charge of. And we also have a new project which will begin this year where we are going to try on the first section of 13 miles of setback levee in the Birds Point-New Madrid Floodway to recreate the virgin forest that was there when the Indians were there.

I spoke with Dr. George Yatskavich of the world-famous Missouri Botanical Gardens. Missouri Botanical Gardens is featured in this month's National Geographic Magazine. He says that trying to recreate a virgin forest—he says you people are five years ahead of your time. No one has ever tried to do this.

The point is, we are environmentalists. We are concerned. We are conservationists. And we very much resent the very narrowly conceived agenda that led to this language being included. His sweeping agenda includes wilderness, wetlands, waterfowl and wildlife. Ours includes those things as well. But in addition, it includes the crucial human dimension that his totally ignores. Thank you.

[The prepared statement of Mr. Goodin appears on p. 1500.]

The CHAIRMAN. I want to thank each of you for your statements. I think you have made your points well. You should rest assured that we will take your message back with us to Washington and will work with Congressman Emerson in trying to address them. Mr. Hammerschmidt.

Mr. HAMMERSCHMIDT. Thank you very much, gentlemen, for your very good statements. I have many of the same concerns you do about section 15. I was instrumental in putting section 12 in there because we have some tremendous damages to the levee system down in southwest Arkansas. And I wanted to give the Corps some flexibility to look and see. It has been their policy, as you know, not to build levees to protect private producing farmlands. That has always been their policy. But, we put section 12 in there to give them some flexibility. Hopefully, they will use it. But, I worry, as you do, about section 15. I thank you for your testimony.

The CHAIRMAN. Mr. Inhofe.

Mr. **Inhofe**. Yes. Let me ask you a question, Mr. Goodin. What was your—that is quite an ambitious planning—planting program that you have undertaken and I guess—are you through the program or are you in the middle of it? And what was your source of funding for that program?

Mr. **Goodin**. It continues. The impetus for it was erosion control and wildlife cover. It is virtually complete, I say. One hundred thousand trees is a lot of trees. We will probably add another 20,000, 30,000 in the coming years. This is all on private land. Over $200,000 worth of prime agricultural land. We got together. The Missouri Department of Conservation cooperated. We had the Department of Forestry. We had the Soil Conservation Service, the ASC office. We had Westvaco Timber Corporation gave us vital technical help. And we put the project together and did it.

Mr. **Inhofe**. I see. That is a very impressive and ambitious project. I think it does show that the wildlife, environmentalist and conservation concerns can be one and the same.

Mr. **Goodin**. That is exactly right.

Mr. **Inhofe**. Thank you, sir.

The **Chairman**. Bill Emerson.

Mr. **Emerson**. No questions, Mr. Chairman. I just want to say how grateful I am that you and Mr. Hammerschmidt, Mr. Laughlin, Mr. Inhofe and Mr. Hancock could hear this statement as it relates to a water problem over which this Committee has jurisdiction. And I think these witnesses have made very, very sensitive statements, and I am just glad you all are here to hear it straight from them. I try to convey their views all the time in the Committee and other fora in Washington. But, I think that to hear it directly from the affected people—these are natural environmentalists and conservationists sitting before us right now. They have lived on the land all their lives. They know what they are talking about. And it is important that their point of view be well heard, and I am grateful to all of you for being here today to hear it.

The **Chairman**. Mr. Hancock.

Mr. **Hancock**. Mr. Chairman, I do not have any questions of this group. I also have worked in the environmental area. In fact, I planted over 3,000 walnut trees on some prime land in Green County—and incidentally, they are doing great. I do not know whether I will live long enough to see the product; but it is a project that I have been working on since 1977. And I have been advocating in this area especially that I feel everybody out there ought to have at least eight or ten acres of walnut or hardwood planted. Not only does it help the environment. It helps the game, the fish, the wildlife, and the run-off of water. But, it would have a great economic impact. I wish I had planted those trees when I was 20 years old. I would hate to even estimate what the cost—or the value—of that 3,000 pruned and taken care of walnut trees would be now if they were 40 years old.

But, anyway, is this the proper time for me to make a closing statement, sir?

The **Chairman**. Yes.

Mr. **Hancock**. Thank you.

I really appreciate, Mr. Chairman, you coming to the 7th District, John Paul, Bill Emerson, Greg Laughlin and Jim Inhofe as well. It is a real honor to be associated with this Committee and a person that has had the career that you have had over 50 years of public service of various types. The support that I have received over the past two years from this group in particular has been something that, quite frankly, I will treasure the rest of my life and as long as I serve in the United States Congress. And I really appreciate the Committee—the people who have come in and testified to this Committee and the cooperation, not only of the Congressmen themselves, but all of our staff. I think you have got the best Committee on Capitol Hill.

The CHAIRMAN. Thank you.

Mr. HANCOCK. And I guess I could say "we have the best committee."

The CHAIRMAN. We have.

Mr. HANCOCK. Thank you, sir.

The CHAIRMAN. And I want to thank all of our witnesses here today for their expertise and for helping us better understand the importance of our nation's infrastructure needs from the perspective of the State of Missouri. I also want to thank the people of the 7th District for their warmth and hospitality. And Mel, I thank you for your untiring interest and enthusiasm and your staff for their hard work in making today's hearing possible. And of course, I am also pleased that Bill Emerson's constituents' statements were—interests were represented, and we will be working with Bill to meet the needs which were articulated. Anyway, thank you. I thought that was a very good meeting.

With that, the Committee stands adjourned. Thank you very much.

[Whereupon, at 12:01 p.m., the Committee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

STATEMENT OF RALPH BOYER REGARDING FLOOD CONTROL
AUGUST 31, 1990

Mr. Chairman, Gentlemen:

My name is Ralph Boyer and I am the Associate Commissioner for Scott County, Missouri. I am here today to discuss the issue of flood control as part of our very critical infrastructure needs.

Scott County, in the far southeastern edge of Missouri, has approximately 15 miles of Mississippi River shoreline. We have historically faced, and continue to face some rather unique problems living next to this powerful river. The Mississippi River, as you may know, drains almost half of the entire nation's water, and Scott county is located in part of the "funnel" where this water begins to collect in huge volume. There are many vital flood control projects along the Mississippi, and many more that are needed.

In particular, I have been actively involved in trying to help make progress on the St Johns Bayou Flood Control Project. This project, which was authorized by Congress in the 1950's, and then authorized for implementation in the Water Resources Development Act of 1986, calls for the construction of two pumping stations which would serve three counties, more than 140 miles of channel improvements, and the purchase of almost 7;500 acres for mitigation efforts. I might add that the plan has tremendous potential for serving migratory waterfowl,and thus would provide the added benefit of a valuable wetland area for environmental needs.

This is a vital infrastructure need for Scott County, and one that will enable us to control flood waters and attract economic development, businesses, jobs, and ensure stable transportation routes in the area while also playing a role in helping our environment. In short, this is a very worthwhile project, and one that enjoys support from everyone involved.

The overwhelming problem that our community faces, is that over the twenty years that we have been trying to start this project, we *simply have not been able to come up with the local cost share, that is some $33 million dollars. A bond issue is out of the question in rural Scott County, because we would be unable to pay it back. Nonetheless, this project is desperately needed to control the flood waters of the Mississippi River, and the costs continue to grow even further out of reach.*

The Water Resources Act, which the House Public Works and Transportation Committee recently adopted, contains a provision which may be of some help to us. Section 12 of this legislation gives the Army Corps of Engineers the flexibility of reducing the local cost share requirements to take into account situations very much like the one I have just described -- one where the local community is in great need, but cannot afford the up-front capital costs. I cannot emphasize strongly enough how important this section is, not only to St Johns Bayou Project and to Scott County, but to numerous other flood control projects which are not represented here today.

Mr. Chairman, in short, we have long needed help with the costs of bringing our county's infrastructure "up to par." Your committee has provided an avenue which is a good start for us to make long-over due progress. The rest of this country may take for granted that their excess rain water drains away and never floods their cities and towns, but I can tell you where almost half of that water ends up. The Mississippi River provides a basic service that goes largely unnoticed, except for those who live near her shores. If we can control this flooding, we can ensure our community will grow strongly into the future.

Thank you.

LEVEE DISTRICT NO. 3

Mississippi County
P. O. BOX 176
WYATT, MISSOURI 63882

REMARKS BY DAVID B. BREWER, PRESIDENT, LEVEE DISTRICT NO. 3, MISSISSIPPI COUNTY, MISSOURI TO THE PUBLIC WORKS AND TRANSPORTATION FIELD HEARING IN SPRINGFIELD, MISSOURI

AUGUST 31, 1990

Mr. Chairman. Gentlemen. I have been assigned the task of discussing the "ability to pay" provision associated with water resources projects in the economically depressed Mississippi River Delta Region.

Mississippi County is one of three counties in Southeast Missouri that will benefit from a flood control project known as the St. Johns Bayou/Birds Point-New Madrid Floodway Project. The project was authorized by the Congress in the Water Resources Development Act of 1986.

I am going to tell you folks, we have problems.

The St. Johns Bayou-New Madrid Floodway flood control project is a good project, a worthy project, and one that would save more than $8.5 million in flood damages annually to a large, tri-county area of the State of Missouri, which happens to be the northernmost portion of the Mississippi Embayment, the geological feature associated with the Mississippi River Delta. The area is fundamentally rural and is economically depressed.

The project would also provide fish and wildlife mitigation lands preserving our valuable environment and increasing habitat for wildlife. Most of this land has been in cultivation for more than 100 years. The project will not drain wetlands; it will allocate additional lands for wetland management.

At the moment, we have two distinct drainage basins, created by the construction of the Birds Point-New Madrid Floodway in the 1930s. A setback levee divides the two basins. (Refer to map.)

Backwater enters a 1,500-foot gap between the setback and frontline levees near New Madrid during relatively minor floods on the Mississippi River. The water drains out pretty well as soon as the river drops, but backwater flooding does get to be expensive and limits development in that area

As far as the St. Johns Basin is concerned, all of that portion behind the setback levee drains only through six 10 X 10 foot gates in the setback levee near New Madrid. Local water gets impounded behind the levee often and floods portions of Scott, Mississippi and New Madrid Counties for long periods of time.

The project involves improving rural and urban channels in Mississippi, Scott and New Madrid Counties and the construction of two pumping plants, one to serve the St. Johns Bayou area of the three counties, and a second for the Birds Point-New Madrid Floodway.

In a related project authorized in the 1950s and expected to be funded Federally, the 1,500-foot gap in the levees would be closed.

The project includes the purchase of 2,500 acres of land in the Ten Mile Pond area and development of two greentree reservoirs there for mitigation; and fish pool weirs on St. Johns Bayou Main Ditch. The sump area of each of the pumping stations would be allowed to flood each year for migratory waterfowl, allowing a total of 775 acres of woodland and 4,129 acres of cropland to flood each year after harvest. This would provide migratory waterfowl nesting and feeding areas, and would increase hunting opportunities during the winter months.

Latest total construction costs are estimated to be more than $75 million, including flood control and fish and wildlife mitigation, with $30.5 million being the non-federal cost. Of that amount, the estimated non-federal "cash up front of construction" costs will total $3.85 million.

The operation, maintenance and replacement costs for the project, as estimated by the Corps, are $558,000 annually for both flood control and mitigation. Of that amount, $530,000 is the annual cost of the flood control features alone.

We have two primary sponsors — the St. Johns Levee and Drainage District and the St. John's Bayou Basin Drainage District. We also have seven other sponsors, including the City of Sikeston, the Missouri Department of Conservation, two county commissions, Levee District No. 3, Consolidated Drainage District No. 1 of Mississippi County and St. James Drainage District of Missouri, all of which have some jurisdiction over physical improvements to the land in specific portions of the project.

We do not have an "umbrella" district formed to identify benefits, or to levy taxes to meet expenses. We have been looking locally at the possibility of enlarging St. Johns Levee and Drainage District and reassessing benefits, bringing in more money. However, St. Johns only raises from $70,000 to $80,000 annually. Even with an enlarged tax base — even if we double the tax base — they still will not be able to take care of current obligations and operate and maintain those pumps. The other primary potential sponsor, St. Johns Bayou Drainage District raises only $24,000 annually.

As I said, the local cost share requirement for this project, including the purchase of the mitigation land, is more than $30 million. Operation and maintenance is expected to be $558,000 annually.

We don't know where we can come up with that kind of money.

For one thing, according to the Missouri Statutes, a Levee or Drainage District can only tax up to 10 percent of the cost of the original construction of that District in one year. Many of the Districts are taxing at or near this level at this time. There is no way we can float bond issues when we can't increase our revenues to pay off the bonds. It is an unfortunate fact of life, that most local political subdivisions are scraping the bottom of the barrel now to meet existing obligations. How can they assume additional obligations?

In summary, the St. Johns Bayou-New Madrid Floodway Project is one we have longed for and worked toward for more than 20 years. It is not "pork barrel." It is a good project, supported by all agencies involved. The kicker - after all this time and study - is we, the local interests - cannot afford to build it if we must pay five percent of the cost of construction up front and 40 percent of the total cost. And - even if we did miraculously get it built - we couldn't afford to operate, maintain, and replace it. The local OM&R share is $558,000 annually. We don't know where we can come up with that kind of money.

That is the problem facing citizens residing in the Mississippi River Delta. We have to live with the river, as best we can. And the water in that river comes from 41 percent of the contiguous 48 states and portions of Canada.

We would like to go on record in support of Section 12 of HR 5314, the Water Resources Development Act of 1990, and in total opposition to Section 15 of that same proposed Act. Section 12, we understand, would give us some relief concerning the cost sharing requirement, while Section 15 will effectively block any development within the 100-year floodplain.

I have included a copy of Section 15 for your reflection.

Thank you for your consideration.

and section 13, the term ``wetlands'' means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.

SEC. 15. FLOOD PLAIN MANAGEMENT.

(a) BENEFIT-COST ANALYSIS.--The Secretary shall not include in the benefit base for justifying Federal flood damage reduction projects--

(1) any new or substantially reconstructed structure built in the 100-year flood plain after July 1, 1991; and

(2) any structure that becomes located in the 100-year flood plain by virtue of constrictions placed in the flood plain after July 1, 1991.

(b) COST SHARING.--Not later than January 1, 1992, the Secretary shall transmit to Congress a report on the feasibility and advisability of increasing the non-Federal share of costs for new projects in areas where new or substantially reconstructed structures and other constrictions are built or placed in the 100-year flood plain after the initial date of the affected governmental unit's entry into the regular program of the national flood insurance program of the National Flood Insurance Act of 1968.

(c) REGULATIONS.--The Secretary, in consultation with the

Director of the Federal Emergency Management Agency, shall issue regulations to implement this section. Such regulations shall define key terms, such as new or substantially reconstructed structure, constriction, and 100-year flood plain.

(d) APPLICABILITY.--The provisions of this section shall apply to any project, or separable element thereof, for which a final report of the Chief of Engineers has not been forwarded to the Secretary on or before July 1, 1998.

SEC. 16. SHORELINE PROTECTION.

Not later than 1 year after the date of enactment of this Act, the Secretary shall transmit to Congress a report on the advisability of not participating in the planning, implementation, or maintenance of any beach stabilization or renourishment project involving Federal funds unless the State in which the proposed project will be located has established or committed to establish a beach front management program that includes--

(1) restrictions on new development seaward of an erosion setback line (based on preproject beach size) of at least 50 times the annual erosion rate;

(2) restrictions on construction of new structural stabilization projects, such as seawalls and groins, and their reconstruction if damaged by 50 percent or more;

(3) provisions for the relocation of structures in erosion-prone areas;

Benefits of Hydropower for Rural Missouri's Economy

Thank you, Mr. Chairman, ladies and gentlemen.

It's a pleasure to join you today to discuss federal hydropower as it relates to the economy of rural Missouri. As the power supplier for 40 electric cooperatives in Missouri and three in Iowa, Associated serves approximately 1.2 million rural consumers.

Hydroelectric power from federal dams, which is sold as preference power to rural electric cooperatives, has been the salvation of the rural electric program in our territory and many other areas of the country. In fact, low-cost federal power brought, and continues to provide, electricity to many sparsely populated areas of the United States. Missouri's electric cooperatives average only 4.3 consumers per mile of line compared to investor-owned utilities which average 30 consumers per mile of line. Hydropower helps offset the cost of providing service to these remote, low-density areas.

In 1988, a total of 648 rural electric distribution systems throughout the nation obtained energy from federal marketing agencies, or preference power, at favorable rates.

If the 41 rural electric cooperatives in Missouri did not have access to federal hydropower, it would have cost us $40 million more to provide service to rural Missouri. The absence of hydropower could substantially increase rates to rural Missourians.

Because of our reliance on hydropower to help us affordably serve our low-density rural areas, we are very interested in HR5314, the Water Resources Development Act of 1990 recently voted out of your committee. It would authorize the development of water projects by the Army Corps of Engineers.

We support the concept of maintaining a regular schedule of authorization bills for Corps projects, and hope that a water resources act can be enacted this year.

However, we strongly urge support for Congressman Tim Valentine's effort to improve language in an amendment titled "Changes in Reservoir Project Operations" that was one of the en bloc amendments accepted in the full committee mark-up. We understand Mr. Valentine is attempting to make the House language more closely resemble Section 308 of the Senate Water Resources Act, S. 2740. We strongly support Sec. 308.

The Senate Sec. 308 language:

(1) Establishes a broad, public participatory procedure for the Corps of Engineers to use in the establishment of water control plans;

(2) Requires the Corps to determine if a proposed operational change at a project is consistent with Congressionally authorized purposes; and

(3) Instructs the Corps to seek Congressional authorization for any water control plan which is not consistent with Congressionally authorized cost-benefit analysis.

Society's needs and interests change with time. Certainly we need to respond to those changes. However, we believe that Congress, and not the Corps of Engineers, should be the arbiter of society's changing interests. Thus, we support Sec. 308 of the Senate Water Resources Act, and urge the House to adopt similar language.

One final note on federal hydropower--as a customer of the Southwestern Power Administration, we support its need to maintain financial integrity. However, we are not in support of SWPA's 1990 Power Repayment Study which would result in a 17 percent rate increase. We would encourage a phased-in rate increase which would allow an accurate validation of SWPA's expenses--especially operation and maintenance expense. A gradual approach would also soften the rate impact on our rural consumers--who are already faced with numerous other economic problems. My written testimony includes additional details on this proposed rate increase.

In summary, I'd like to emphasize the importance of federal hydropower in helping rural communities survive. Anything that detracts from the hydroelectric operations of federal projects places a burden on our rural communities which are already faced with many economic hardships. Hydropower and recreation can co-exist successfully, but there is a large price to pay if we under-utilize the hydropower purpose of federal projects. We hope that the U.S. Congress and the Administration will maintain the integrity of the federal hydropower program; and perpetuate its original intent of supplying low-cost power to rural consumers who need it most.

Gentlemen, thank you for your time and your concern for rural Missouri.

Dear Mr. Schafer:

In accordance with the Federal Register notice published May 23, 1990, we have enclosed ten copies of Associated's comments on the Proposed Integrated System Rates.

We would like to thank you and your staff for all your help during the preparation of this Power Repayment Study. If you have any questions, please call.

Sincerely,

Duane Highley

COMMENTS FROM ASSOCIATED ELECTRIC COOPERATIVE, INC. REGARDING SWPA'S PROPOSED 17% RATE INCREASE

August 17, 1990

As a customer of SWPA, it is our desire that SWPA maintain financial integrity by meeting its debt repayment goals. We have reviewed the 1990 Power Repayment Study (PRS) which indicates the need for a 17% rate increase but we are unable to support this level of increase, mainly due to uncertainties in the O&M expense forecasts made and because of the adverse impact such an increase would have on our rural Missouri and southern Iowa customers. Instead, we support a phased rate increase which will not only allow more time for the O&M forecasts to prove themselves but will also mitigate the rate impact to our customers, while still maintaining an adequate level of repayment for SWPA. Our specific comments supporting this position follow:

1. Throughout the PRS review process we have been misled by referring to the proposed increase as a 14.4% revenue increase, while it is really a 17% rate increase. The true rate increase is indeed mitigated for some customers through the application of purchased power credits, but these credits are temporary in nature and do not apply to all of SWPA's customers. The ultimate effect of the proposed action will eventually be a 17% rate increase (and revenue increase) for all customers.

2. The proposed 17% rate increase would have a tremendous impact on Associated's customers. We provide service to some of the most economically depressed areas of the Midwest, covering most of rural Missouri and a part of southern Iowa. The proposal would result in an increased cost to Associated of $3.1 million per year, which would ultimately be passed along to the cooperative members across our service area. While no one can assess the actual impact of draining $3.1 million per year from an already economically depressed area,

our economic development staff has estimated a six-fold turnover of cash in a rural community. That is, a dollar spent in rural Missouri will turn over six times in commerce, creating additional jobs and increased tax revenues, before that dollar leaves the local economy. By depriving the cooperative customers in these areas of $3.1 million each year, we can only guess at an annual repercussion of $18.6 million in jobs, tax revenue, and the like. For this reason it is imperative that any increase needed by SWPA be fully justified and demonstrated to benefit today's customers who will be paying the bill.

3. Today's customers should not pay higher rates than are currently necessary simply to cover projected expenses which may occur in the mid-nineties. As SWPA's own studies indicate, only an 8% increase is now needed to cover expenses in FY-1990. The remaining increase is due to speculation about expenses (particularly O&M) beyond FY-1990. Today's customers should pay only what is needed to insure SWPA's financial integrity. To pay more, simply based on uncertain forecasts, is unjustifiable. Why should today's customers pay more to cover speculative costs which might be incurred for the benefit of future customers?

The RA-6120 document does not specify a particular cost evaluation period which must be used. Instead, it suggests that studies are normally done for five years. This does not preclude the use of a shorter period if special conditions, such as increased uncertainty in key O&M forecasts, cause a five-year period to produce unreliable and unrealistic results. In the 1987/1988 PRS, only a four-year evaluation period was used. Most utilities, including Associated, set their rates based on a one-year cost-of-service study, recognizing that long-range forecasts are extremely unreliable. Because of the magnitude of the increase and doubtful O&M forecasts, we recommend a phased rate based on a one-year evaluation period.

4. Another way that today's customers are forced to pay higher rates with no current benefits is through the use of the 50-year repayment period. In RA-6120.2, section 7.f.1, it is stated that SWPA should use "the same basic power system included at the time rates were approved" over the course of the PRS. However, beginning in the fifth year, SWPA freezes revenue and expenses through the 50th year of the study BUT DOES NOT FREEZE NEW INVESTMENT COSTS, which continue to increase each year. This drives today's rates higher to cover investment which will not occur for many years hence. Since today's customers receive no benefit from this speculative future investment, they should not be asked to pay higher rates to cover it.

   It could be argued that this practice is done to leave the power system in the same state it was in at the beginning of the study, however, this is not entirely true. The future power system, after many replacements with increased costs (through inflation), will have much more debt than today's system, with higher installed capital cost and annual depreciation. Future replacement costs should be borne by those who benefit from the replacement--the future customers. The effect of these future replacement costs should not be included in today's rates.

5. SWPA's O&M and GA&O expenses are responsible for about one-seventh of the 17% rate increase. This is primarily due to the increasing use of contractors for these services. This circumvents the DOE's attempt to limit SWPA activity and control costs by instituting a hiring freeze. Instead of lowering costs, as was intended, the action has resulted in increased costs as more and more work is performed by contractors, for their own profit and to the detriment of SWPA's customers.

   It is especially troublesome to customers to see SWPA office space devoted exclusively to in-house contractors for engineering services.

The only difference between a permanent in-house contractor and a full-time employee is the element of profit, which will benefit the contractor. Where is the benefit for SWPA customers?

It is difficult to believe that ever-increasing amounts of O&M and G&A are needed at a time when SWPA has no major system improvements planned. We fear that the use of contract labor will convert SWPA staff from a knowledgeable working staff into a staff of project managers, overseeing an expanding group of semi-permanent outside contractors.

6. In the PRS, SWPA continues to show an energy bank balance of 754,802 MWh each year beyond 1994. In the long run, with average hydrological conditions, it is assumed that energy into the bank will equal energy out of it. Therefore, SWPA should plan to draw the bank down to zero balance by FY-1995, at the end of the cost evaluation period. Assuming a modest energy value of only 11 mills/kWh, this would provide an additional $8.3 million of revenue to offset a portion of the rate increase needed.

   As purchase costs increase in the future, the value of energy in the bank will also increase, and this should be recognized in the PRS.

7. Most of the proposed 17% rate increase is based on forecasts of increasing Corps of Engineers' O&M expenses. Besides being the largest component of the proposed increase, it is the most difficult to justify. Because of our reluctance to accept the Corps' O&M forecast, we urge SWPA to adopt a phased rate, to allow time for a more thorough review of Corps costs. It may well prove that the remaining increases in later years would not be needed at all.

   Our primary objections to the Corps' O&M costs are in five areas:

A. Difficulty in making accurate forecasts of costs up to five years hence.

B. Conflicting statements made by COE officials.

C. Lack of adequate response of the Corps to SWPA customers' concerns.

D. Conclusions made by a subcommittee of the Southwest Power Resources Association regarding Corps O&M.

E. Inappropriate use of "age factors" in preparing the cost forecast.

F. Inclusion of extraordinary salary increases in the "trend line" for future O&M increases.

These objections are discussed in detail below.

7A. All planners recognize the difficulty in making accurate forecasts for the coming year's expenses. Forecasts beyond one year become more and more uncertain, as evidenced in past PRS projections. The accuracy of previous forecasts was investigated in order to estimate the accuracy of the current forecast. A comparison was made between the projected 1990 O&M expenses in the current PRS and those same 1990 expenses as forecast in the previous 1987/1988 PRS. While the total FY-1990 O&M expense is only 5% higher in the new PRS, significant changes can be seen in individual projects. Of the 22 projects listed, eight have significantly lower O&M projections in the new study than the old, 12 have increased significantly, and two have changed only slightly. Eight projects had differences in excess of 30% from the previous projection. This highlights the difficulty in predicting O&M expenses only two years hence. If SWPA cannot predict Corps O&M two years into the future, how can we have confidence in the proposed five-year forecast?

Looking at historical PRS projections, even for the first year of the cost evaluation period, further illustrates the difficulty in forecasting.

	Error in Projection of FY-1986 Costs in 1986 PRS	Error in Projection of FY-1988 Costs in 1988 PRS
Bull Shoals	-17%	-56%
Stockton	+48%	-12%

These projects are just two examples of the error inherent in every O&M forecast. The error in the current FY-1990 forecast will not be known until 1991. Because the proposed 17% rate increase is based largely on these uncertain O&M forecasts, we support phasing in the increase over several years, to allow time for these forecasts to prove themselves.

7B. We are also uneasy about the Corps' O&M forecast because of the conflicting statements recently made by Corps officials. First, we were given an O&M projection with record high costs and continuing increases above the inflation rate. Next, a Corps General made statements to SWPA indicating that the Corps plans to perform only breakdown maintenance, with no preventative maintenance program. This is a direct conflict to the record high O&M budget just developed. A letter sent to the Corps by SWPA requesting clarification of this issue has not been answered. We cannot support an SWPA rate increase which is driven almost entirely by Corps O&M if we cannot get clear signals from the Corps explaining the planned O&M program.

7C. The customers have been frustrated in their attempt to gain information about Corps expenses because of a lack of response by the Corps to their requests. In a letter containing 14 questions regarding Corps O&M expenses, only brief and inconclusive answers were given. A typical response was that the requested information was "probably available in the various district offices, but it would take considerable time and effort to find and compile the data."* If the customers cannot effectively review these expenses, they cannot support the record high projections made by the Corps.

7D. A subcommittee of the Southwestern Power Resources Association recently conducted a review of Corps O&M expenses, with the following conclusions:

1) For the 1983 to 1988 time period the Corps had determined that 43% of all identifiable costs had been misclassified between expense items and capital items. Steps have been taken to reclassify these costs, but no change has been made to the future O&M projections based on these findings.

2) "It is possible that cash settlements received by the Corps resulting from litigation related to faulty design and engineering of a hydropower facility are not credited to hydropower operations..."

3) "Financial, compliance, and management audits of hydropower operations are virtually non-existent."

4) "...it is apparent that hydropower does not assume a high degree of priority for accounting oversight or audit."

---

* Letter from W. O. Elliott to J. M. Shafer, February 26, 1990

5) "There has been a continuous frustration with the lack of oversight opportunity afforded for monitoring and evaluating Corps' operation, maintenance, and replacement costs...it is recommended that a plan of oversight be developed."

A copy of this study was provided to the Corps with a request for comments, but apparently the Corps has chosen to ignore the subcommittee's conclusions, since no response has been forthcoming.

Until SWPA customers can achieve effective oversight of Corps expenses, we cannot support the tremendous O&M increase which is driving the majority of the proposed SWPA rate increase.

7E. In making the future O&M projections, the Corps inappropriately applies an "age factor" to older plants which increases their O&M expense. After reviewing the baseline O&M expenses for each plant, an additional factor of 1% per year (compounded) is added for units over 20 years in age, and 2% per year (compounded) for units over 30 years of age. In the critical fifth year of the PRS, this added 5.1% and 10.4% to the baseline O&M for units over 20 and 30 years, respectively.

By the Corps own admission, "[t]hese percentages are entirely judgmental." No study has been performed by the Corps or SWPA to substantiate a higher rate of increase in O&M for older plants. In fact, there is evidence to suggest just the opposite.

1) It has been stated that baseline O&M expenses are predominantly due to salary at the projects. Why should we expect significantly higher salaries in the older projects?

2) If the baseline O&M is an accurate current estimate, we would expect any "age factor" to already be present, without the need for additional escalation.

3) A review of Corps O&M expenses for FY-1980 to 1989 reveals that, on both a $/kW and a $/kWh basis, O&M expenses have been increasing more rapidly at the newer (less than 20 years old) plants. Perhaps this higher level of O&M is caused by the need to correct problems in new and unproven designs, such as slant-axis turbine problems at the Ozark and Weber Falls projects. Alternately, this higher O&M could be caused by other "infant-mortality" problems, which would be expected to moderate after a period of time. With no new units coming on line, we would expect a decrease in overall O&M expenses as the problems in these newer units are corrected.

7F. Large salary increases were given to Corps power plant employees in 1983 (increases of 20% to 30%) and again in 1989 (increases of 17.9%). These large increases, far above the inflation rate, were necessary to bring Corps salaries up to "industry standards." Although these large increases are not expected to continue, they have influenced the historical trend line for O&M expenses. This effect should be removed from historical costs when comparisons are made to future costs. Since we do not expect these extraordinary salary increases to continue, future O&M expenses should increase more slowly than they did in the 1980s.

Because of this evidence, we cannot support the O&M forecast provided by the Corps to SWPA. Because the Corps' O&M increases are responsible for over 80% of the proposed SWPA rate increase, we believe any increase should be slowly phased in to allow more time for review of the O&M issue.

In summary, we do not support the proposed 17% rate increase, but instead request a phased approach, for the following reasons:

- o The deleterious effect on the economy of rural Missouri and southern Iowa would be lessened with a phased rate. If O&M forecasts did not prove themselves, the local economy could be maintained with minimum disruption.
- o Because it is impossible to forecast the future, less emphasis should be placed on long-range forecasts. A rate which will give SWPA adequate revenues in the short term is all that is necessary.
- o Many problems and uncertainties in the Corps' O&M forecasts cast serious doubt on its credibility. A phased-in rate increase would provide time for these forecasts to prove themselves.

Statement of Thomas Finnie
City Manager, Springfield, MO.

REMARKS FOR THE CONGRESSIONAL COMMITTEE

On behalf of the citizens of Springfield, the Mayor and City Council, I would like to express thanks to the committee for this opportunity to discuss our infrastructure requirements. Our department directors will speak to the specifics; my comments will be more on our overall concerns.

We have growing pains. We know as a growing community that there are projects that if built today, will save our citizens major dollars in future years. National Avenue needs to be extended today, not years from now when we will have to take homes and businesses at terrible cost to the taxpayer and the economic well-being to many businesses.

We need Federal support for projects that are your responsibility but are essential to our long-term vitality. We cannot build a four lane highway to Kansas City yet this is our number one need in serving Springfield citizens, Missouri citizens and this entire region. It is critical to our economic growth. We also spend too much energy coordinating our efforts with the State to have them frustrated by categorical funding limitations that often result in lower priority projects being built because of funding availability while higher priority projects go begging.

We need to correct some mistakes. We make the same number of mistakes as any business. The difference is that ours are most often well publicized since they are made out in the open in the proverbial "fish bowl". We also have to correct our mistakes in order to gain support for moving ahead. Unlike the private sector, we are not able to chalk up a mistake to the cost of doing business. Ingram Mill Road is an example of our inability to fund a project when it needed building years ago and which is now a million dollar problem.

We have to deal with the State and Federal government's desire to cut expenditures without cutting services. We are where the rubber meets the road. Our cuts mean less service and it doesn't take a long distance phone call or plane ticket to complain to those responsible. When the Federal government reduces transit funding, it does not necessarily reduce the impact of government cost on the public; it simply moves it to our level.

As is the case for many businesses, we often need to spend money in order to save or make money. For example, there may not be an overwhelming citizen outcry for a fiber optic system in Springfield. But if we don't move to ensure this technology, we may find ourselves so far behind the time in ten years as to be in the economic backwaters of the country.

We have a responsibility to protect our citizens and our environment. We need Regional, State and National policies and funding to address problems that are Regional, State and Federal in scope.

These are the issues we are coping with. You can help. When you pass legislation costing money, you should identify the cost and be willing to pay. You can quit tinkering with tax changes that claim to reduce taxes but simply move them down to us to levy. Most importantly, you can help us with those critical projects that are essential to our future well-being. I would put at the top of that list a four-lane road from Springfield to Kansas City and funding for stormwater management.

NEEDS ASSESSMENT PRESENTATION
FOR THE
CITY OF SPRINGFIELD, MISSOURI

AUGUST 31, 1990

Presented by: Mr. Charles R. Turner, P.E.
Acting Director of Public Works

Municipal managers, for any growing community, are continually evaluating the condition and capacity of the services they provide to their citizens.

Springfield is no exception. Both short and long range plans are continually being developed that reflect the most current needs of the City. The City's current Three-Year Plan for the Public Works Department shows four major priorities of service that need to be provided:

Priority #1 - Improved Street Maintenance Program
Priority #2 - Capital Improvements Program
Priority #3 - Traffic and Street Sign Maintenance and Maintenance of a Computerized Signal System
Priority #4 - Improved Tree Planting and Public Facilities Maintenance Program

Over 700 miles of streets, roads and alleys, over 800 miles of sanitary sewer line, 400 miles of sidewalk, 100 traffic signals, 50,000 traffic signs, 49 municipal buildings and over 18,000 public trees are presently maintained by the City of Springfield.

Increased maintenance cost, combined with an every expanding system, results in a reduced ability to properly maintain our roads, sidewalks and parks. As an example, since 1972 the number of lane miles of our streets has increased by 35% while at the same time the number of personnel available to maintain those streets has decreased by 5% and the amount of funds available for maintenance per mile has decreased by 26%. This has occurred at the same time that construction cost have increased 133%.

With these type of statistics, the City is faced with a future street system that will continue to deteriorate. The result will be a need for substantially more funds for the complete re-construction of these streets at a later date.

Some of the more critical street improvement needs facing Springfield today are Ingram Mill Road from Sunshine Street south to Battlefield Road, National Avenue from Route "M" to the South City Limits and Fremont Avenue from Battlefield Road to Route "M". The estimated construction cost of just these projects is $5.0 million dollars.

The demand for other city services continues to rise as the community grows. The need to provide additional sanitary sewers, stormwater protection facilities, fire stations and police protection is an ever present delimna faced by communities like Springfield.

These are not frivolous extras. These are basic public services that the public demands and deserves.

The growing awareness of problems associated with the current pollution entering our streams and water courses has now placed a greater emphasis on providing the community with a more comprehensive urban stormwater management program. This will be expensive. Combining the water quality needs, with the flood control needs will require detailed comprehensive evaluations be done on each of the City's major drainage basins. The cost of just these evaluations for Springfield will be over $2.0 million dollars.

It is less costly for the community to plan and prepare for addressing these issues before development occurs. The purchasing of proper drainageways prior to houses and businesses being constructed lessens the economical impact on the community by not having to purchase those houses and businesses in the future to correct a drainage problem.

Solid waste management is another area that is receiving greater public attentionacross the nation, and rightfully so. Residents of our City expect and deserve to have a solid waste disposal system that does not result in an increase of the potential for polluting our water supplies and wholesale usage of the land. The City of Springfield has been investigating alternatives to landfilling for several years and are now considering presenting a $37 million dollar bond issue to the voters to provide such a system.

The City has recently prepared a list of over 70 major Public Works projects that should be constructed. At this time this list represents only a recognition of problems areas that need to be fixed if the funds can be secured. Six to ten million dollars a year are desparately needed to provide the City of Springfield with an adequate capital improvements program. These costs will continue to escalate if inadequate maintenance and planning continue. Without additional funding sources, the ability to provide the necessary maintenance and planning will be difficult if not impossible.

Thank you for your time and consideration of these comments.

CITY UTILITIES of SPRINGFIELD
301 E. Central P.O. Box 551 Springfield, Missouri 65801 (417) 831-8311

Statement by
Duane Galloway, Assistant to General Manager
CITY UTILITIES OF SPRINGFIELD
before a regional hearing on
The Future of Our Nation's Infrastructure Needs
THE FULL COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
of the
UNITED STATES HOUSE OF REPRESENTATIVES
Springfield, Missouri
August 31, 1990

Good morning Mr. Chairman and members of the Committee, my name is Duane Galloway. I am an Assistant to the General Manager of City Utilities. City Utilities is a municipal utility with the responsibility of supplying the electric, natural gas, water and public transportation needs of Springfield, Missouri and the immediate surrounding area. We currently have approximately 75,000 electric customers, 63,000 natural gas customers, and 57,000 water customers. City Utilities is controlled by, and under the direction of, an eleven-member citizens committee - the Board of Public Utilities - which is appointed by the City Council.

City Utilities has a formalized long-range strategic planning process which identifies the infrastructure needs of the Utility for at least 10 years into the future. Significant major capital projects will be needed if the Utility is to continue to meet its duty to the Springfield community.

WATER PROJECTS

Burns & McDonnell, a nationally known engineering consulting firm, recently completed a study to identify a long-term water supply to meet the needs of Springfield for the next 50 years. Over a dozen possible options were evaluated. Public hearings have been held this week to gather public comment on the project recommended by the consultant. The Board of Public Utilities plans to make a final decision within 60 days. The project will cost an estimated $80 million. The Water Utility has annual revenues of approximately $15 million.

It is anticipated the project will be built by City Utilities without any Federal or State assistance using traditional tax exempt revenue bonds. While the project will be financially challenging given the limited local revenues available, it is possible for a community the size of Springfield with a municipal utility as financially sound as City Utilities. Such is probably not the case for many smaller communities, even in areas such as the Ozarks where water is considered to be plentiful.

All across the Nation, communities of all sizes are faced with repairing and replacing worn-out water systems and with finding new water sources to meet increasing demands. This is occurring at a time when Federal mandates are requiring even more stringent water quality standards, and when restrictions are being placed on the traditional financing methods used by municipalities to fund these types of projects.

City Utilities has a history of, and a reputation for, furnishing our customer-owners with high quality, dependable drinking water. We have a certified laboratory, managed by a PhD, and staffed with eleven professionals. We typically do much more water quality testing than is required and supply a finished product that far exceeds all regulatory standards. We understand the need for increasing the requirements on water quality and do not object to meeting reasonable new standards. What we do object to is costly new mandated requirements with no federal assistance, coupled with a reduction in our traditional funding mechanisms.

In all honesty, Springfield has the ability to meet our forecasted water needs. Our customers paid less for their utility services last year than they did eight years ago. If the need truly exists, there is every reason to believe that they will be willing and able to pay for future projects. Many smaller and less prosperous communities will not be able to meet their needs without some form of federal and state partnership. Strong public policy arguments supported massive federal aid in the form of grants and loans for sewer projects. Given the enormous need and the apparent lack of ability to fund those needs, we would argue that the Committee should look at increased funding of water projects as one element of meeting the Nation's infrastructure needs.

POWER SUPPLY

City Utilities, as a public power system, is owned by the local community we serve. Our rates and policies are set by a governing Board appointed by a locally elected City Council. Public power systems differ from "investor-owned utilities" (IOUs) in that publicly-owned systems are non-profit organizations operated by and for the local community, while investor-owned systems are owned by private stockholders and provide electricity for a profit. Public power systems have existed since the earliest days of electric utilities in this Country. As long as tax-exempt municipal bonds have existed, publicly-owned power systems have been issuing them to finance their capital needs.

There are 1,982 publicly-owned local electric systems in the United States, and 63 publicly-owned joint action agencies. Joint action agencies are organizations formed by several public power systems, acting in concert, to plan, build, and operate efficiently-sized power plants and other facilities and to coordinate power contracts to meet the needs of their member systems. Through economies of scale, these joint action agencies have enabled public power systems in small communities to provide electric service at reasonable rates that would not otherwise be possible.

Small public power systems are not uncommon. In fact, while City Utilities is a comparatively large public power system, the bulk of public power systems are small with 75 percent serving communities under 10,000 people. The median size public power system serves 1,696 customers.

While the reasons for creating public power systems vary, the benefits they offer are generally the same. Unlike IOU's, public power systems serve only one master - their customer-owner. On average, residential rates for customers of local public power systems are 23 percent below those charged by investor-owned utilities.

Because they are consumer-owned, public power systems offer the consumer a direct voice in the establishment of service policies and rate structures, as well as a voice in the design and siting of utility facilities. In addition, because they are publicly-owned and accountable to their locally elected governments, local officials can integrate utility operations with other local government services. As an example, the Board of Public Utilities manages the public power electric system, the municipal natural gas system, the municipal water system, and as part of a local governmental service, the electric and natural gas utilities help subsidize the public transportation system.

City Utilities' electric system, an important part of Springfield's local governmental capital-intensive infrastructure system, is heavily dependant on the use of tax-exempt financing in building needed new power generation and replacing existing power generation. If tax-exempt bonds are to be allowed to exist, and we certainly would argue that they should, we believe public power and all such traditional governmentally-owned operations should be able to access the tax-exempt bond market in a reasonable manner.

TRANSIT

City Utilities operates a public bus transportation system providing fixed-route service and demand-responsive service to Springfield, Missouri. We carry about 1.4 million passengers per year, of which over 40 percent are elderly and handicapped. Demand-responsive service, which is curb-to-curb service utilizing wheelchair lift-equipped buses, carries about 18,000 passengers per year.

Revenues from passengers recover only 13 percent of operating expenses for the transit system, and City Utilities is dependent upon Federal assistance in order to continue providing low-cost transportation service to Springfield. This year City Utilities received $779,000 in operating assistance from the Urban Mass Transportation Administration, but the remainder of the operating deficit (about $2.3 million) was collected from the electric and natural gas ratepayers.

Recent legislation, such as the Americans with Disabilities Act of 1990 and more stringent air quality regulations, increase both City Utilities' capital investment in new motor buses and its operating expenses. Without increased Federal assistance, this will translate into reduced service at a time when mass transportation should be assuming a greater role in meeting the Nation's economic, environmental, and social goals.

In your review, we recommend giving consideration to the American Public Transit Association's eleven "Principles to Guide Reauthorization of the Surface Transportation Assistance Act." These principles are attached.

PRINCIPLES

TO GUIDE REAUTHORIZATION OF THE SURFACE TRANSPORTATION ASSISTANCE ACT-1991

Adopted by The
APTA Board of Directors
September 24, 1989

Attached are eleven statements of principle adopted by the APTA Executive Committee and Board of Directors. The principles are based on deliberations of the APTA Legislative Committee, Subcommittee on Strategic Planning and the Transit 2000 Task Force.

PRINCIPLES

TO GUIDE REAUTHORIZATION OF THE SURFACE TRANSPORTATION ASSISTANCE ACT

Preamble

The following principles are proposed as a guide in reformulating federal transit and highway programs. The principles are intended for application in conjunction with increases in federal funding for transit, including funding adequate to meet current and future transit needs and the cost of federal mandates. The principles presume continued federal support at least at current levels for existing programs and projects.

DRAFT PRINCIPLES

PRINCIPLE 1

THE FEDERAL INVESTMENT IN SURFACE TRANSPORTATION SHOULD BE SUBSTANTIALLY INCREASED AND, WITH THESE INCREASES, PARTS OF THE FEDERAL PROGRAM SHOULD BE SUBSTANTIALLY RESTRUCTURED.

Rationale: The current highway and transit programs are not adequately responsive or flexible to address current and emerging needs and problems. Substantial restructuring can only occur if significant additional resources are provided.

PRINCIPLE 2

IN ORDER TO ACCOMMODATE A DIVERSITY OF PASSENGER TRAVEL WHILE REDUCING VEHICLE-MILES, THE DEFINITION OF TRANSIT AND THE UMTA CHARTER SHOULD BE BROADENED TO ENCOMPASS AND PROMOTE INCREASED AVAILABILITY AND USE OF HIGH-OCCUPANCY, SHARED-RIDE SERVICES.

Rationale: Provides a clear statement of UMTA's goals. Invites a closer linkage between mobility goals and broader national goals. Broadens the transit constituency. Promotes investment in new mobility strategies and a broader range of services. Promotes reconsideration of current eligibility restrictions.

PRINCIPLE 3

ALLOW GREATER FLEXIBILITY IN THE USE OF AVAILABLE FEDERAL FUNDS; ENHANCE AND STRENGTHEN THE EXISTING REGIONAL DECISION-MAKING AUTHORITY OVER THE USE OF FEDERAL TRANSPORTATION FUNDS.

Rationale: Strengthen local ability to address needs, set priorities and use resources for capital and operating needs in a regional context. Strengthen local decision making processes. Reduce federal program management and administrative requirements that unnecessarily dictate local actions.

PRINCIPLE 4

ESTABLISH A STRONGER MULTI MODEL APPROACH IN PLANNING, FUNDING AND DECISION-MAKING.

Rationale: Better integration of transportation decisions, funding and services. Greater assurance of appropriate trade-offs between multiple goals and objectives on the local and regional level. Encourage more cost-effective use of available funds.

PRINCIPLE 5

RELIABILITY AND PREDICTABILITY OF FEDERAL FUNDING MUST BE IMPROVED THROUGH GREATER RELIANCE ON DEDICATED FUNDING. THE COST ASSOCIATED WITH MANDATED FEDERAL ACTIONS, AND THE SUBSTANTIAL CONTRIBUTION OF TRANSIT TO THE ACHIEVEMENT OF OTHER NATIONAL GOALS PROVIDES JUSTIFICATION FOR INCREASED FEDERAL SUPPORT FROM ALL SOURCES.

Rationale: Increase reliability and predictability of funding in light of uncertainties in the general fund annual budget and appropriation process.

Recognize and support the important, legitimate contributions of transit to a host of national goals, using those contributions as a fundamental rationale for continued general fund support of transit. Limit the jeopardy to transit from annual budget and appropriations cycles. Attract new constituents in support of transit. Strengthen support for increased transit investment.

PRINCIPLE 6

INCREASE RELIANCE ON RELIABLE AND PREDICTABLE FORMULA FUNDING USING FACTORS BETTER REFLECTING TRANSIT NEEDS.

Rationale: Increase the reliability and predictability of funding to all recipients. Ensure discretionary funding priority for transit projects that cannot be accommodated within the formula program. Refocus new discretionary funds on achievement of national goals and issues of national significance, e.g. safety congestion, air quality, energy conservation, economic development, service to the transportation disadvantaged.

PRINCIPLE 7

SUBSTANTIAL ADDITIONAL FUNDING SHOULD BE PROVIDED FOR TRANSIT TO FULLY CARRY OUT THE NATIONAL GOAL OF SIGNIFICANTLY INCREASING THE PROVISION AND USE OF HIGH-OCCUPANCY, SHARED-RIDE SERVICES.

Rationale: Federal transit funding has been reduced 50% in the last 8 years in real terms. All indications are that historic disinvestment in transportation, the current condition of facilities and future demand require at least a doubling of total investment to be shared by all partners. $6-8 billion per year in federal transit investment is needed to support basic reinvestment, projects currently in the advanced stages of planning and commitment and to recover recent reductions and lost purchasing power. Substantial additional federal funds beyond this level are needed to accommodate additional riders and market share, reduce vehicle-miles of travel and attract major new funding commitments from non-federal sources.

PRINCIPLE 8

AN IMMEDIATE GAS TAX/MOTOR FUELS TAX INCREASE SHOULD BE ENACTED AND THE ENTIRE FEDERAL TAX MADE PERMANENT CONCURRENT WITH REAUTHORIZATION OF THE SURFACE TRANSPORTATION ASSISTANCE ACT TO SUPPORT NEEDED TRANSIT AND HIGHWAY INVESTMENT.

Rationale: Needs are immediate. The traditional source of transportation funding should continue to be the basic resource for increased investment. Claims will be made by others on gas tax increases with action on tax increases, including a gas tax, will likely take place sooner rather than later.

PRINCIPLE 9

THE FEDERAL TRANSPORTATION PROGRAM AND TAX CODE SHOULD BE REVISED TO PROMOTE PRIVATE AND NON-FEDERAL INVESTMENT IN TRANSIT, AND TO ELIMINATE THE TAXATION OF EMPLOYER-SUBSIDIZED TRANSIT PASSES AND OTHER DISINCENTIVES TO TRANSIT USE.

Rationale: Other federal policies should support direct investment in and use of transit rather than frustrate the goals that transit investment seeks to serve.

PRINCIPLE 10

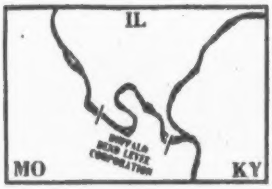
FEDERAL TRANSPORTATION POLICIES AND PROGRAMS SHOULD REQUIRE CLOSER INTEGRATION OF TRANSPORTATION INVESTMENTS AND LAND USE DECISIONS IN ORDER TO PROVIDE AN ENVIRONMENT THAT IS CONDUCIVE TO AND ENCOURAGES INCREASED PROVISION AND USE OF HIGH-OCCUPANCY, SHARED-RIDE SERVICES. OTHER FEDERAL POLICIES AFFECTING TRANSPORTATION DEMAND, PLANNING AND INVESTMENT SHOULD INCORPORATE THE SAME OBJECTIVE.

Rationale: Unless development practices and policies at the local level are consistent with basic federal transportation goals, the effectiveness of federal transportation investment will be greatly diminished along with the opportunity to advance other national goals. Federal attention to how land uses and development are arrayed across the landscape is necessary in reinforcing this essential linkage.

PRINCIPLE 11

EXPAND FEDERAL SUPPORT FOR BASIC RESEARCH, DEVELOPMENT, TRAINING AND HUMAN RESOURCES ACTIVITIES AFFECTING TRANSIT, AND ENSURE ADEQUATE DIRECTION OF THE PROGRAM BY TRANSIT INDUSTRY OFFICIALS.

Rationale: Federal investment in basic research, development and human resources have diminished dramatically in recent years. The success and cost-effectiveness of investment in facilities and services requires significant increases in funding in these areas.



BUFFALO BEND
LEVEE CORPORATION

POST OFFICE BOX 322 • CHARLESTON, MISSOURI 63834

31 Aug 1990

Statement of Lester W. Goodin, President
Buffalo Bend Levee Association
Charleston, Missouri

House Public Works and Transportation Committee Field Hearing
Springfield, Missouri

Gentlemen:

I have a most urgent problem. You are examining our nation's future infrastructure needs, yet I come from and represent an area that is specifically and by definition excluded from any consideration for infrastructure inprovement. I am from the the Mississippi Delta area of Missouri, and I am speaking for the entire Delta area, from Commerce, Missouri, to the Head of Passes below New Orleans.

May I direct your attention to Section 15 of HR 5314 entitled "The Water Resources Development Act of 1990." Section 15 deals with Flood Plain Management; paragraphs (a) through (d) of that section deal with benefit/cost analysis criteria, cost sharing, regulations, and appricibility. To summarize this bill's specific instructions: NO area within the "100-Year Flood Plain" may be included "in the benefit base for justifying Federal flood damage reduction projects."

Gentlemen, this means that virtually the entire Mississippi Delta is effectively and forever excluded from further development of its infrastructure, since virtually the entire Delta is, using current FEMA criteria, within the "100-Year Flood Plain." The Delta is, and has been for more than 150 years, highly developed land, in large part (but by no means exclusively) agricultural. For the economic and social development of its people, for the enhancement of its environmental quality, it MUST participate in the development of infrastructure. It needs not just major highway maintenance and improvement, but better secondary or feeder roads, ports to take advantage of its wonderfully efficient transport system -- the Mississippi River itself -- drainage and erosion control projects, water quality monitoring and control, areas for wildlife, wilderness areas.

Yet if House Resolution 5314 becomes law such projects will be impossible to justify almost anywhere in the Delta.

A Private Levee District In Scott & Mississippi Counties In Missouri & Alexander County In Illinois

From Mile 4 To Mile 30 On The Mississippi River Above Cairo

House Resolution 5314 has been reported out of committee and is to go before the full House. Section 15 is a critical flaw. I urge you to recall the bill for consideration of that section.

Sincerely,

Buffalo Bend Levee Association

Lester W. Goodin, President

TESTIMONY OF
ROBERT D. HANCIK, A.A.E.
DIRECTOR OF AVIATION
SPRINGFIELD REGIONAL AIRPORT
BEFORE THE
U.S. HOUSE OF REPRESENTATIVES
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
FIELD HEARING
AUGUST 31, 1990
DRURY COLLEGE
SPRINGFIELD, MISSOURI

Good morning, Mr. Chairman and members of the Committee. I am Robert Hancik, Director of Aviation of the Springfield Regional Airport; President, Great Lakes Chapter, American Association of Airport Executives; and we are also a member of AOCI. On behalf of the City of Springfield Airport Board, the AAAE and AOCI, we express our appreciation for the bold and aggressive leadership the Public Works Committee has shown to date on airport issues; in particular, yourself, Mr. Chairman, our neighbor to the south, Mr. Hammerschmidt, Mr. Clinger, and of course, Mr. Hancock.

You are continually listening to the testimony of the heavy hitters; however, through representatives like Mr. Hancock, we have had the opportunity to provide input from the smaller airport operators. I wish to briefly express my views relative to the issues you have successfully addressed on their effects on southwest Missouri and many airports like Springfield.

Each of your successes, reauthorization of AIP, encompassing the most important Passenger Facility Charge (PFC), tenant liability language, and fending off the Alamo issue, effect a Springfield, Missouri, as it would a major hub airport, but proportionately with a greater financial impact.

The capital needs of the Springfield Regional Airport, which services not only Springfield, but southwest Missouri and northern Arkansas, are obviously beyond the financial capabilities of this community when weighed against the City's general infrastructure needs of sewers, storm drainage, streets, solid waste disposal, operational dollars, etc. We are in the final stages of our Master Plan Study. Our preliminary capital costs, which we are revealing this morning, are estimated at $56.8 million over the next twenty years, and are further detailed on the attachment to this written testimony. $27 million in infrastructure in the next five years, $18 million identified as being eligible under the current federal AIP program.

We recognize the financial restraints of FAA facility improvements for operations and safety. However, our growth, with approximately 100 airline operations a day, need to be recognized in the authorization process, but not by place-naming projects in the appropriation, but decisions made on operational data and safety standards.

Gentlemen, we serve a truly regional area. This region is faced with growth beyond its infrastructure capabilities, not only in the tradition of business and industry, but by the demonstrated growth in the medical field, retirement and tourism.

The intent of the aviation trust fund has been eroded and continually raided over the years. It has been used as a political pawn at the expense of the air traveler. Changes to the current AIP program and its predecessors have only put "patches on an exploding inner tube." It is time to start rethinking how the estimated $50 billion in airport capital improvement needs of our nation's airports will be funded in the next five years. Yes, I believe in the current trend and apply the philosophy that the users should pay for the system. However, we must temper that philosophy by the country's interest and investment in maintaining and building a national air transportation system second to none. We all benefit from the air transportation of people and goods, indirectly or directly, whether one ever flies in an airplane, be it via the airlines or the corporate and general aviation fleet.

Again, I state it is time to rethink the funding of this country's airport infrastructure. The PFC is an obvious element in that equation, for which I applaud your foresight and hope the Senate eventually agrees. It must be noted those small airports that feed a hub dominated by one air carrier have extremely high air fares and the impact of an additional twelve dollars to a ticket must be measured by the spoke airport on diverting the passenger to the automobile. The current funding percentages of the AIP program offer little discretionary dollars and decision-making capabilities on projects that need to be done. The protection of unspent airport entitlement as a debit against the current year's appropriation needs to be eliminated. If an airport doesn't have a project, let's not bank the dollars, but get them into the system.

Unfortunately, my time is limited. We hope our past input through the aviation subcommittee via Mr. Hancock, has been beneficial and that of our representative organizations. I welcome any questions and offer our continuing support.

Thank you.

DRAFT

Table G1

PHASE I (0-5 YEARS) DEVELOPMENT PLAN PROJECT COSTS

Springfield Regional Airport

	Project Description	Total Cost	Recommended Financing Method Local	State	Federal
A.1	Land Acquisition (820 Acres)	$2,050,000.00	$205,000.00		$1,845,000.00
A.2	Renovate/Expand Passenger Terminal and a Portion of the Air Carrier Apron *	$10,600,000.00	$5,900,000.00		$4,700,000.00
A.3	Remove Large Hangars North of Terminal and Expand Apron	$303,000.00	$30,300.00		$272,700.00
A.4	Construct New Fuel Facilities	$1,647,000.00	$1,647,000.00		
A.5	Construct Snow Equipment Building	$1,100,000.00	$110,000.00		$990,000.00
A.6	Extend and Renovate Runway 14/32 Along With Parallel and Connecting Taxiway System with Lights and PAPI	$5,960,000.00	$596,000.00		$5,364,000.00
A.7	Install Runway 14 CAT I Approach	FAA Funded			
A.8	Construct G.A. Apron and Taxiways	$872,000.00	$43,600.00	$43,600.00	$784,800.00
A.9	Construct Partial Parallel Taxiway on the West Side of Runway 02/20	$2,812,000.00	$281,200.00		$2,530,800.00
A.10	Construct Security Fencing	$328,000.00	$32,800.00		$295,200.00
A.11	Construct Perimeter Road	$805,000.00	$80,500.00		$724,500.00
A.12	Rehabilitate Air Carrier Apron	$320,000.00	$32,000.00		$288,000.00
A.13	Rehabilitate General Aviation Apron	$125,000.00	$6,250.00	$6,250.00	$112,500.00
A.14	Relocate Taxiway "T"	$75,000.00	$7,500.00		$67,500.00
	Sub-Total/Phase I	$26,997,000.00	$8,972,150.00	$49,850.00	$17,975,000.00

* Local Share Subject to Revenue Bond or Private Financing.

Note: Costs are intended for planning purposes only and should not be used for construction cost estimates.

	GRAND TOTAL **	$56,851,000.00	$13,964,250.00	$108,650.00	$42,778,100.00

* Local Share Subject to Revenue Bond or Private Financing.

** $7,852,000 of the Total Local Share is Subject to Revenue Bond or Private Financing.

Note: Costs are intended for planning purposes only and should not be used for construction cost estimates.

August 29, 1990

Chairman Anderson, Members of the Committee, Ladies and Gentlemen:

My name is Peter Herschend. I am Executive Vice President and co-owner of Silver Dollar City, a theme park located here in Southwest Missouri, with annual visitation of 1,750,000 visitors. I am also President of the Ozark Marketing Council, a regional marketing organization to develop the travel industry here in Southwest Missouri. In addition I am President of the Travel Federation of Missouri.

Some individuals have from time to time observed that the travel industry is a frivolous industry...one that we could easily do away with, or certainly reduce if the times required it. I would argue that you should not tell that to the 20,000+ men and women who are actively employed in the first line of Southwest Missouri's travel industry. I would argue that you should not tell that to the financial community that has made outstanding loans to the travel industry. I think you should not tell that to the retail community here in Southwest Missouri, who benefits in large measure from the expenditures made by visitors to this region in excess of $1,000,000,000 annually. In other words, in Southwest Missouri, the travel industry in all of its various forms is a very significant part of the economy, of the job picture, of the long-term growth of this region.

Today, in Missouri the SIC codes (Standard Industrial Classification) that are inclusive of travel, as generally defined, are the only segment of Missouri's economy that is showing consistent and significant growth over the period of the last several years.

Employment in agriculture has declined. Employment in manufacturing is running essentially flat. The travel industry has grown. I have included those numbers and their sourcing as an addendum to these comments.

Nowhere in Missouri is this more true than here in Southwest Missouri. We have seen a time of rapid growth in visitation by others coming into the state to see and enjoy Ozark Mountain Country. We continue to see that trend in the future. The charts at the back of these comments will reflect for you the rapid growth in physical plant that Ozark Mountain Country has seen in the period 1982 through 1990. These facilities, such as restaurant seating capacity, campground spaces, theatre seats, and accommodations would not have grown were there not a significant demand for them.

However, all is not roses. We have a real potential of slow strangulation of our industry. The ability of the major highway infrastructure system leading into Southwest Missouri as well as serving inside Southwest Missouri is falling behind in its ability to handle the ever increasing number of vehicles/visitors that wish to move in this direction for recreation purposes.

I am sure that each of the Committee members, Mr. Chairman, is familiar with the great joy of riding on an interstate highway that is coming apart at the seams. I am sure, Mr. Chairman, that you and each member of this Commission have had the unending pleasure of being held up in traffic when you did not anticipate the holdup.

I am sure, Mr. Chairman, that you and each member of this Committee have made travel decisions to go to one area versus another, because you felt or knew that the travel capacities of the first area were going to be taxed, and your ability to move within that area was going to be extremely limited.

Mr. Chairman, the solution is never easy to complex issues like this. I do not purport to have the wisdom of the Committee nor the breadth of information that is being laid before you.

I am, and our travel industry in Missouri is a strong advocate of the federal government's release of the Highway Trust Funds back to the states on an equitable basis insuring that those Funds get spent for the purpose that they were intended...to rebuild and expand, where appropriate, the highway/transportation infrastructure of this nation.

Cast in a negative light, if we do not see the capacities of the interstate system, as well as the primary and secondary highway systems of Southwest Missouri maintained and increased, then speculation of economic strangulation will no longer be speculation. We will see a curtailment, and then an absolute decline in the number of visitors coming to this area.

I can draw a graph for you that will coorelate the number of visitors to the number of persons employed. Those are strong negatives, and impact the lives of thousands of people...but they do not have to be.

I hope and pray that through the work of this hearing and other community hearings that you and the members of the Committee are undertaking throughout this nation, we will be able to see the federal government's release of the Highway Funds. We will be able to see the opening of the vital arteries of traffic, not just in Southwest Missouri, but throughout this nation so that the highway systems become the primary support of economic development and are not regarded as the inhibitors of that development.

Mr. Chairman, my thanks for this opportunity. I stand ready to be of whatever assistance I can at this time or in the future.

Respectfully,

Peter F. Herschend
Executive Vice President
Silver Dollar City, Inc.

Statement of Roger W. Howard

Director of Government Affairs, Burlington Northern Railroad

Before the

House Committee on Public Works and Transportation

Infrastructure

August 31, 1990

Springfield, Missouri

My name is Roger W. Howard. I am Director of Government Affairs, Southern Region, Burlington Northern Railroad.

I am pleased to have this opportunity to discuss the positive role our company and the rail industry can play in effecting a solution to the congestion and deterioration of the nation's publicly financed infrastructure.

In recent years, Burlington Northern has worked hard to establish a solid partnership with our customers. In certain instances, our customers are truckers. We value this business and want to maintain our good working relations with them.

We have made dramatic improvements in the handling of carload and door-to-door intermodal shipments. We believe such partnerships offer a positive solution to the problems facing the publicly-owned and maintained infrastructure.

In order for this partnership to thrive we need an efficient network of local highways for pickup and delivery to compliment our long haul rail service. Together we can provide the shipping public with the most cost efficient, environmentally sound and safe transportation system possible.

Other witnesses here today will talk of the positive aspects of their modes of transportation. Let me speak to some of the virtues of the railroad industry.

RAILROADS OFFER THE BEST SOLUTION TO OUR INFRASTRUCTURE DILEMMA:

Railroads are fuel efficient--railroads use only 2.2% of the fuel consumed by all transportation modes.[1] Railroads can haul 2.76 more ton miles per gallon of fuel than can trucks.[2]

Railroads are environmentally preferable--scarcity of land and environmental concerns are obvious reasons why massive amounts of new highways cannot be added. Because railroads are more fuel efficient, they contribute less to air pollution. Because rail moves on steel, they don't create the environmental concerns associated with rubber tire wear and tire disposal.

---

[2] See AAR, Integrated Transportation Policy for an Era of Rising Expectations, August 1989, FN. 29, p. 51.

Railroads have excess capacity that current highway systems do not--in 1989, U.S. Railroads hauled one trillion ton miles[3] and has the capacity to haul many times that amount without experiencing congestion. Improved efficiency through escalation of advanced train control technology utilizing advanced telecommunications, satellite tracking and microprocessor controls can increase the capacity of main line track by as much as three (3) times. Installation of parallel track along a portion of main line can increase capacity as much as six (6) times.[4] This can all be done without the land acquisition and environmental problems common to highway construction.

Railroads have an outstanding safety record--on a per billion ton mile basis railroads experienced only 2.79 accidents.[5] Train accidents followed by release of hazardous materials have declined by 63% since 1980, while traffic volumes have increased. There has been only one hazardous material rail-related death since 1980.[6]

Railroads have an enviable employee safety record. The National Safety Council reports occupational injury rate for rail workers is substantially better than the other transportation modes, and significantly better than both the private sector and manufacturing sectors.[7]

Economies of density--as rail traffic increases over a specific corridor, the average cost per unit of freight falls. Increased densities improve rail service quality with more frequent train departures.

The nation's rail system offers a solution to pressing infrastructure concerns. We are the only freight transportation system that bears the full cost of construction and maintenance of its infrastructure and we even pay property taxes on it.

Although we have emerged from Staggers a healthier industry, transitioning from a tightly regulated environment to a customer-driven marketplace, we continue to face a threatening and competitive marketplace. Skewed by a national policy subsidizing competing modes, government policy continues to exert a profound influence on how the marketplace distributes freight among the various transportation modes. Our company and the rail industry has invested substantively in providing intermodal service to our customers. Continued and/or increased governmental policy preference to other modes will seriously jeopardize our ability to compete in the marketplace. Railroads currently operate at a severe competitive disadvantage, while public policy distorts transportation choices and reduces overall efficiency of freight transportation. Expansion of governmental policies advantaging competing modes will result in a lowering of rail profits, greater congestion on the highways and a much smaller rail system which may later require subsidization to survive. Truck diversion of rail traffic has slowed as railroads have improved service, consistency, reliability and innovation. Our intermodal technologies are accelerating and we look forward to justifying our investment and achieving potential market share.

---

[3] See "Freight Traffic Records Set by U.S. Railroads," AAR News Release, Jan. 8, 1990.

[4] Computer Simulation Performed by Burlington Northern's Technology, Engineering and Maintenance Department.

[5] Rail Data from FRA, Accident/Incident Bulletin, 1988, Op. Cit., Tables 2, 3, 14.

[6] FRA, Accident/Incident Bulletin, 1985 and 1988, Table 26.

[7] See "BLS Reports on Survey of Occupational Injuries and Illnesses in 1988," News Release of Labor Statistics, November 15, 1989, Table 3. The injury rate per 100 rail workers in 1988 was 6.8, for trucking 13.8; for air lines 12.8; for water transportation and manufacturing sectors 12.1; and for the private sector 8.3.

Today, we offer a solution to the public infrastructure crisis. With your positive consideration we seek to avert the crisis facing our private rail infrastructure.

WRITTEN STATEMENT BEFORE

THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

Relating to

THE IMPORTANCE OF INFRASTRUCTURE TO THE CITY, THE STATE AND THE COUNTRY

BY

WILLIAM E. KIRKMAN
President
Springfield Area Chamber of Commerce

August 31, 1990

In an era of global economy there are many challenging issues the United States must address. However, few issues are as pressing as transportation. If the United States is to maintain its economic leadership in the world market, the need for a high quality, highly efficient transportation network is paramount. Competition is elemental, yet how can a level of competition be maintained if the process of getting goods to market breaks down?

The Springfield Area Chamber of Commerce is especially pleased to have been included in this hearing. Transportation is of eminent concern to our efforts. Congruent to our area needs are the needs of Missouri. We believe what is good for the state is good for Springfield and what is good for Springfield is good for the state and country.

While the problems associated with the funding and allocation of transportation projects are immense on a national level, they seem almost overwhelming on the local scene. In Springfield, Missouri's third largest metropolitan area, transportation, both ground and air, is vital. The continued growth and development of Springfield is directly tied to the ability to supply needed infrastructure to both existing and potential business. The ability to create the jobs and capital investment that will make Springfield strong and ultimately, the country , is in jeporady.

The present Federal Highway Act, now ten years old, expires September 30, 1991. The act provided for the interstate highway system and with the network of interstate highways completed, it is now time to address present and future needs. The completed interstate program now needs a new direction, but a consensus of that direction seems to be difficult. We encourage and support the timely passage of the next Federal Highway Act. We favor the act proposed by the American Association of State Highway and Transportation Officials (AASHTO) and the Federal Highway Administration.

We also believe that revenue in the Federal Highway Trust Fund should be used for the purpose it was collected with no diversion or sequestering of funds. As it stands now, the federal government is holding back transportation trust funds to counterbalance the federal deficit. The revolving door that collects federal highway user taxes and then distributes funds to the states for highway construction isn't swinging as quickly as it once did. It has been estimated that Missouri would receive $200 million more per year if the trust fund balance was released and Missouri received a fair share in the next Federal

Highway Act. In addition the situation will be further complicated if the federal government raises fuel taxes to reduce the deficit. Missouri ranks fourth in the country in the amount of fuel used per vehicle. The deficit is a national problem and a federal fuel tax would place an unfair burden on Missourians. Additionally we believe, along with the Missouri Chamber of Commerce, that demonstration projects are not in the best interest of a good highway system and that a rational plan, one that is good for the entire country is by far the better policy.

While there are definite concerns and areas of need regarding federal, state, and local transportation the federal/state partnership is creating successes as well. Springfield is a city on the move and transportation infrastructure is playing a major role. Recent examples of Federal matching funds allowing construction are: the 744/Interstate 44 interchange which will open up one of Springfield's largest and most viable industrial park areas. Federal funds utilized on the James River Expressway project are already having a very positive effect on Springfield's economy. Within the city, 5-laning of key Springfield streets is a further example of federal funds at work. New construction for the most part is assisted with federal money and that assistance is greatly appreciated. Yet, because of transportation issues, Springfield increasingly finds itself at a competitive disadvantage with other parts of the country in the scramble for economic development. The lack of a 4-lane highway between Springfield and Kansas City is an outstanding example.

Transportation needs are skyrocketing in this nation. In many areas of the country all modes of transportation are operating near or at capacity. Now is the time for answers to be found to insure both the economic and social growth of America.

This written testimony expresses the concerns of midwestern citizens. Some of our needs are similar to those of the east and west coast population and some of the needs are unique to us. In your role as United State Congressmen, we are certain you will weigh those needs of Missouri with equal consideration.

STATEMENT BEFORE THE HOUSE OF PUBLIC WORKS AND TRANSPORTATION COMMITTEE RELATING TO THE FUTURE OF THE NATION'S INFRASTRUCTURE

BY HAROLD L. McCOY, DIRECTOR OF PUBLIC WORKS/DEPUTY CITY MANAGER AND CHAIRMAN OF THE JOPLIN METROPOLITAN TRANSPORTATION PLANNING ORGANIZATION.

My name is Harold McCoy. I am the Chairman of the Joplin Metropolitan Planning Organization and also Deputy City Manager of the City of Joplin, Missouri. Thank you for this opportunity to speak before you today.

Infrastructure needs affect communities on a broad spectrum. I would like to address each one individually. Joplin--being the 4th largest metro area in the State of Missouri and Southwest Missouri being one of the fastest growing areas in the United States will be greatly affected by future infrastructure funding programs.

HIGHWAY - Joplin benefits from having 34 trucking terminals, four of which are the headquarters, with 2,600 tractor units and 6,000 trailers being based in Joplin. Therefore, highways are of major concern for the future economy of the region. We are boosters of the Highway 71/I-49 corridor improvement from Kansas City to Shreveport. We appreciate the consideration the Committee has given to this project in the past. We ask your continued support for improving this corridor to a minimum of freeway standards and hopefully to an interstate standard in the future.

We support the Missouri Highway Department's position that highway trust funds should be allocated based upon highway user miles within each governmental boundary. We have a great deal of concern about the new proposed highway bills omitting funding for urban areas. If we are to use the concept of allocation based upon highway miles travelled, then urban areas should get their fair allocation under this system. An FHWA '87 report states 18 percent of the roadway miles are in urbanized areas with 59 percent travel occurring on urban roadways.

AVIATION - Joplin operates a regional airport which would be classified as a small air carrier by FAA standards. We have been devastated by the effects of deregulation. We have had drastic increases in air fares due to lack of competition and any additional increase from a tax on airline tickets would put us at a greater economic disadvantage. We do support a passenger facility charge which would allow small air carrier airports to use this revenue to match entitlement funding program. Deregulation has greatly reduced the abilities of small airports to generate revenues. Further, small air carrier airports should not be required to use their enplanement allocations for general aviation purposes. General aviation needs to be funded through discretionary funds. Such items as paved aircraft parking aprons, general aviation taxiways, and runways too short for air carriers are examples of projects to be funded from discretionary funds. The consolidation of flight service stations have created safety problems at small air carrier airports, due to the fact that after the tower operational hours of the airport, no traffic control exists. Also, the lack of up-to-date weather reports due to the consolidated flight service station, i.e. wind velocities and direction, and cloud ceiling height are additional safety concerns. The FAA needs to install automated equipment or change its method of operation to allow up-to-date weather information to be furnished with a change in weather conditions.

WASTEWATER- The new wastewater funding program, being operated through the EPA and state environmental agencies, is totally inadequate. This nation has made great strides in improving water quality in the past decade. A new program is doomed for failure because local sewer service charges will rise so drastically that they will not be supported by the local populace. Joplin has completed a $40 million program. If we were amortizing the cost of this improvement today through our sewer service charge program our rates would double, and to finance the improvement need in the next decade our rates will double again.

Southwest Missouri is one of the fastest growing areas in the nation. Impact fees, service charges, construction fees, and assessments will not address the demands put on the local communities to support expansion of needed facilities. Secondary concern is EPA's proposed program of upgrading stream qualities which will require additional stages of treatment, removal of additional items from the wastestream can be removed by present processes. We urge the Committee to closely monitor the proposed loan program to finance wastewater facilities that is now underway. Let us not lose our progress we have made in recent decades to an unworkable program.

Local communities have been abandoned by the federal government. We initially lost federal revenue sharing, the EPA Grant Program has been abandoned, housing community development funds are being discontinued, proposed highway bills omit funding for local needs and aviation trust funds are not being distributed.

In Missouri, as in many states across the nation, you must vote on each tax increase. Very simply, the voters will not, in our opinion, endorse additional taxation required to replace the lost funds or grants that were furnished by above programs. Since we do not have the ability to raise revenues at will, the infrastructure we depend upon for our economic well-being will literally fall around us or from under us.

We urge the Committee to review the new federalism attitudes towards your local communities.

Further, being from conservative Southwest Missouri, I support a balanced budget but not at the expense of our infrastructure needs in the highway and aviation programs. We urge you to release the present trust funds and not allow user fees to be diverted now or increased in the future for deficit reduction.

Thank you for coming to Southwest Missouri. We appreciate your efforts in Congress and thank you for this opportunity.

TESTIMONY OF BLAIR MORAN

HIGHWAY 60 COMMITTEE

SIKESTON, MISSOURI

BEFORE THE

SURFACE TRANSPORTATION SUBCOMMITTEE

OF THE

HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

SPRINGFIELD, MISSOURI

AUGUST 31, 1990

THANK YOU MR. CHAIRMAN, I APPRECIATE THE OPPORTUNITY TO APPEAR BEFORE YOU TODAY TO EXPRESS OUR CONCERNS ON THE TOPIC OF FEDERAL HIGHWAY POLICY.

I LIVE IN SIKESTON, MISSOURI IN THE SOUTHEASTERN CORNER OF THIS STATE AND WE HAVE BEEN. WAITING FOR 30 YEARS FOR THE COMPLETION OF A FOUR-LANE CORRIDOR ACCROSS THE SOUTHERN TIER OF THIS STATE.

FOR THE RECORD, I WOULD LIKE TO POINT OUT THAT THIS SECTION OF SOUTH-CENTRAL MISSOURI AND NORTH-CENTRAL ARKANSAS IS THE LARGEST AREA IN THE EASTERN TWO-THIRDS OF THE UNITED STATES NOT SERVED BY AN INTERSTATE HIGHWAY. THIS SITUATION IS COMPOUNDED BY THE FACT THAT WE ALSO HAVE NO STATE FOUR-LANE HIGHWAYS THROUGH THIS REGION.

STUDY AFTER STUDY ON THE TOPIC OF ECONOMIC-DEVELOPMENT CONCLUDE THAT BUSINESSES EXPAND ONLY ALONG TRANSPORTATION ARTERIES. SO IT COMES AS NO SURPRISE THAT THIS REGION OF OURS ALSO CONTAINS SOME OF THE POOREST COUNTIES IN THE COUNTRY.

WHEN OTHERS TELL YOU THAT THE INTERSTATE SYSTEM HAS BEEN COMPLETED, WE WOULD ASK THAT YOU REMEMBER THAT SOME REGIONS SUCH AS OURS HAVE BEEN LEFT BEHIND. WE DON'T NEED, OR ASK FOR, AN INTERSTATE. BUT WE WOULD LIKE THE COMMITTEE TO REALIZE THAT NEW CONSTRUCTION IS STILL DESPARATELY NEEDED.

IN ADDITION, WE'D LIKE TO OFFER THE FOLLOWING THOUGHTS AS THE SUBCOMMITTEE PREPARES TO REWRITE THE HIGHWAY BILL:

- AN INCREASE IN THE LOCAL MATCHING REQUIREMENT WOULD BE DEVASTATING TO THE POORER STATES WITHOUT THE TAX BASE TO GENERATE THESE RESOURCES.

- THE COMMITTEE COULD GREATLY ASSIST REGIONS LIKE OURS BY OFFERING AN ALTERNATIVE FORMULA FOR PROJECTS IN AREAS WITH HIGH CONCENTRATIONS OF POVERTY. THIS MIGHT HELP COUNTER THE DISTORTIONS WE'VE SEEN IN OUR STATE WHERE ORGANIZED URBAN STATE LEGISLATIVE DELEGATIONS HAVE SECURED A DISPROPORTIONATE SHARE OF THE FEDERAL FUNDS ALLOCATED.

YOU CAN ARGUE THAT BEING A RURAL COMMUNITY IN A MINIMUM ALLOCATION STATE IS THE WORST OF ALL POSSIBLE WORLDS WITH RESPECT TO THE FEDERAL FORMULA. AFTER OUR STATE RECEIVES ITS DISPROPORTIONATELY LOW SHARE, THE URBAN AREAS GRAB A DISPROPORTIONATELY HIGH SHARE, AND WE ARE LEFT WITH THE BARE MINIMUM.

MR. CHAIRMAN, WE HAVE MANY PEOPLE IN THIS REGION WHO KNOW ALL ABOUT HARD WORK. BUT THE JOBS AREN'T COMING HERE LIKE THEY SHOULD BECAUSE THERE'S NO ACCEPTABLE TRANSPORTATION NETWORK. OUR IDEA OF WELFARE REFORM IS TO CREATE MORE JOBS, BUT WE NEED SOME BASIC INVESTMENT IN OUR HIGHWAY SYSTEM TO BRING THOSE JOBS THAT WILL BUILD OUR FUTURE.

THANK YOU ONCE AGAIN FOR YOUR INVITATION AND YOU KIND ATTENTION.

STATEMENT BEFORE THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

Relating to

THE FUTURE OF OUR NATION'S INFRASTRUCTURE

By

WAYNE MURI
Chief Engineer
Missouri Highway and Transportation Department

August 31, 1990

Mr. Chairman, my name is Wayne Muri, and I am the Chief Engineer of the Missouri Highway and Transportation Department. I am pleased to respond to the Committee's invitation to appear at this hearing on the future of our nation's infrastructure. I welcome you and thank you for coming to Missouri.

The United States is facing serious economic challenges in the 1990s. Public investment in the infrastructure is critical to improving the economy and to improving U.S. competition in the world marketplace. This has been shown in studies done by Dr. David Aschauer, formerly a senior economist with the Federal Reserve Bank of Chicago.

There are several issues now before Congress that will affect Missouri's infrastructure investment and the future of our transportation system I'd like to talk about.

NEW FEDERAL TRANSPORTATION PROGRAM

The new federal transportation program must include all modes and integrate them into an efficient system. Missouri will need flexibility in using federal funds to make that system work. The National Transportation Policy presented by Secretary of Transportation Skinner is an excellent program and would do just that. The national transportation policy developed by the American Association of State Highway and Transportation Officials (AASHTO) over the past three years also will do that. Missouri would receive its fair share of federal funds for the first time in many years under either program.

Highways

The Department of Transportation (DOT) and AASHTO programs would give Missouri its fair share in a number of ways.

They will identify a national highway system. The formula for this system will be based on the number of miles of roads driven and the number of miles of roads in a state. Missouri has the sixth-largest state highway system in the U.S. and, as the crossroads of the nation, is used by many.

The DOT and AASHTO programs also will give us the flexibilty to allocate funds among transportation modes. That will allow us to develop a system that can make Missouri more competitive and improve the people's mobility.

Much will be done and many points will be debated before the next act is approved. The DOT and AASHTO programs can be important tools in developing the next surface transportation act. These programs now would provide Missourians with as much as $200 million more per year in federal highway funds. That's almost double the $250 million Missouri now receives. For southern Missouri, that could mean making Route 60 dual-lane and Route 71 a freeway.

Another critical issue for Missouri in the next federal surface transportation act will be the ratio in which federal funds are matched with state funds. The ratio for Missouri now averages about 82 percent federal, 18 percent state. There is discussion of increasing the states' share of the matching ratio. If that happens Missouri would have to forego the funds or raise taxes in order to have sufficient money to match the federal portion.

The current minimum allocation plan keeps Missouri from getting its fair share of funds. Minimum allocation is intended to ensure there is a balance in the distribution of funds among the states. Minimum allocation states are supposed to receive an amount governed by a formula now pegged at 85 percent. While this may seem to be a reasonable figure, it is too low. If minimum allocation is retained, the factor used in determining a state's share should be at least 90 percent.

Demonstration projects or use of discretionary funds that are allowed under the current act mean no additional money for Missouri. Once again, we do not receive our fair share. Demonstration projects or discretionary funds for Missouri mean money is taken out of one pocket and put in another because they are subtracted from our minimum allocation.

Transit

Missouri's population is aging significantly, persons with disabilities are demanding attention to their transportation needs and two job families are increasingly common.

These factors put new demands on our transit system and make it necessary for us to have a strong federal program for public transit. To strengthen the transit program increased federal funding is essential.

Rail

Railroads are a crucial part of a transportation network and essential for strong economic growth. Future transportation programs must preserve rail service and support rail projects as alternatives to other improvements.

Amtrak provides a needed service across Missouri. It has served more than 1.3 million Missourians since it began. Ridership has grown from approximately 50,000 in 1980 to over 157,000 in 1989. Funding and development should be continued for this service.

Local rail assistance programs, which aid several local rail operations in Missouri, should also be continued. These programs help provide rail freight service to smaller communities and agricultural shippers. Both depend on the programs to make transportation costs economical and their goods more affordable.

Aviation

Missouri was selected in May, 1989, by the Federal Aviation Administration (FAA) as one of three states to participate in a two-year State Block Grant Pilot Program. The purpose of the pilot program is to see if states can efficiently administer the Federal Airport Improvement Program.

The states involved are administering the program for all airports having less than 10,000 passengers. Missouri's first year was very successful and the airport sponsors seem pleased. Since most of the first year was needed to establish and organize procedures, that only allows states one year to demonstrate their ability to administer the program. That is not enough time. The pilot program should be extended for at least one year.

Although the pilot program has given aviation in Missouri a boost, most of our airports are old and in need of major repair, like most of the nation's infrastructure.

The aviation industry in Missouri is a primary economic generator that contributes nearly $12.5 billion annually to the state's economy.

Because of the enormous increases projected in air travel and the already mounting pressures to increase airport capacity more funding is essential. Airports of state and national importance should be funded by federal aviation user fees and, where possible, by state aviation fees. General fund support should also be continued.

Waterways

Port authorities offer industries cost savings through the use of waterway transportation. They can help make the U.S. more competitive in world markets. Missouri currently assists 14 public port authorities. This support allows them to maintain the contacts they need to encourage expansion of existing industries and the location of new industries in their communities. The base is started in many areas for the federal government to develop a national port and waterway system. This should be done and tied into the transportation system to provide a complete surface transportation program.

FEDERAL DEFICIT

Proposals to increase the federal fuel tax to reduce the deficit could have a serious adverse effect on Missouri. Mr. Chairman, thank you for fighting these proposals. They would be, as you know, an abuse of the user-fee concept on which the highway system is built. In addition such a plan would force some parts of the country, including Missouri, to pay a disproportionate share.

Our state ranks fourth in the nation in the amount of fuel used per vehicle. An increase in the gas tax of 25 cents per gallon would cost more than $600 million per year in Missouri alone. We realize Iraq's invasion of Kuwait may put this proposal on the back burner for awhile but we feel it will continue to be an option. Please continue to oppose an increase in the fuel tax for reducing the deficit. Any increase in motorist user fees should be used for highways.

CLEAN AIR ACT

The clean air act now being considered by a conference committee could also affect Missouri's transportation system. The Missouri Highway and Transportation Department supports efforts to improve the environment. But two issues in the proposed clean air bill could be detrimental to the states.

The first is the conformity provisions that give the Environmental Protection Agency (EPA) absolute power over highway projects. EPA, rather than the Federal Highway Adminstration (FHWA) would determine whether a project would be built, based on its environmental impact. This would allow EPA to deny funding for a project and Missouri would have no recourse. If Missouri tried to build with state money, EPA could stop all federal highway funds for other projects in Missouri, such as the Mississippi River bridge at Cape Girardeau or the improvement of Route 60.

The second would require gasohol use in St. Louis and similar areas. Gasohol is taxed at only three cents per gallon, while gasoline is taxed at nine cents per gallon. This six-cent gap cost Missouri $8 million last year and the loss is expected to be $9 million next year. Missouri would lose $82 million a year if gasohol is mandated in the conference bill. The present gasohol exemption is intended to encourage gasohol use by lowering the price. It makes no sense to continue that exemption if gasohol must be used.

Transportation is the key to the success of Missouri and the rest of the country. We enjoy the convenience and economic benefits of a transportation system second to none. But we must continue to invest in our transportation system to compete in the global marketplace.

Please consider our recommendations and concerns and adopt legislation that will give Missouri a more equitable share of transportation funding. We also ask you to act in a timely manner so we can plan carefully.

Mr. Chairman, thank you for this opportunity to testify, and for coming to Missouri. We will be pleased to respond to questions the committee may have, and to requests for information.

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

SUBCOMMITTEE ON SURFACE TRANSPORTATION

FIELD HEARING, SPRINGFIELD MISSOURI, AUGUST 31, 1990

Testimony submitted by Laurel R. Thompson
President, West Plains Missouri Industrial Development Corporation
Chairman, Transportation and Economic Development Committee, Greater West Plains Area Chamber of Commerce
Vice-President and Manager, KWPM, Inc., operating radio station KWPM (AM) and KSPQ (FM), West Plains Missouri

We welcome the opportunity to present testimony to this subcommittee, and will present information supporting two primary areas of need. First, the need for long-range planning for completion of upgrading to four lanes the trucker's apparent route of choice from cities like Omaha and Kansas City through Springfield and West Plains Missouri, to Jonesboro Arkansas, Memphis and points south and southeast. Secondly, we continue to search for any possible source of help in addressing the immediate problems of the most severly overloaded portion of that corridor, U.S. Route 63 between Willow Springs and West Plains Missouri.

From the first interstate highway legislation to present time, the Ozarks has been completely by-passed by the system. Even though this northwest-southeast corridor has long been talked about, and the affected states have attempted to treat the most urgent needs, needed federal priorities, coordination and planning have not been present. Even so, only two major areas still need to upgrade to four lanes to accomplish this important diagonal link-up of at least four major north-south and east-west interstates. Parts of Highway 7, from Harrisonville Missouri to Clinton, and much of Highway 13, Clinton to Boliver, need the upgrade, as does U.S. 63 from Willow Springs Missouri to Jonesboro Arkansas. We feel the much faster-than-predicted growth of traffic loads along this entire route, as inadequate as some of it is, is well documented by Missouri traffic studies. Likewise, the mushrooming of tourist travel and rapid proliferation and development of a variety of light to medium industry in South-Central Missouri and North Arkansas is adding greatly to already dangerous traffic overload problems. These overloads are particularly explosive and dangerous along a 20 mile portion of U.S. 63 between Willow Springs and West Plains in Howell County, Missouri. We have studied this situation very closely over the past two or three years, and our problems continue to escalate far beyond the most liberal predictions. The combination of unexpected heavy traffic loads, traffic types, terrain and topography provide a dangerous combination of factors not really present in any other two-lane highways we have found. Twenty-eight percent of vehicles are heavy trucks; 34 percent of Highway 63 between Willow Springs and West Plains is yellow-striped no-passing zones; and in much of the area where passing is legal, the short distance available, traffic load, and congestion prohibit it. This results in dangerously "stacked traffic", with locals realizing that passing attempts are chancy at best and non-productive, but drivers from out of the area become impatient and problems result. While tourism is increasing and does contribute a share of the load, the overwhelming bulk is consistent work-a-day traffic. Area industry has shown explosive growth during the past three years, health care traffic is growing even faster with Ozarks Medical Center at West Plains seeing utilization growth as high as 37 percent during just one of those years; rapid expansion of several area wood products industries, including Bruce Hardwood Flooring with more than 200 new jobs, has increased heavy, slow truck traffic immensely; Southwest Mobile Systems, a defense contractor, is just embarking on two major expansions - two huge defense contracts involving a lot of heavy truck movements and up to 550 new jobs; Safeway Charcoal, south of West Plains, reports that the present Burlington Northern piggyback policy has increased the number of Safeway trucks to Springfield by 800 so far this year alone; every Tuesday, the Ozarks Regional Stockyards north of West Plains sees an average of 4,000 cattle coming into and out of the yards, many utilizing 63 North - all in heavy, slow moving trucks and trailers both coming and going. We are also seeing the probability of a major expansion in poultry processing in West Plains that almost certainly will have a tremendous impact on ag traffic over a 35 mile radius within about 5 years.

The Farm Bureau has recognized the tremendous new pressures on agriculture-related transport created by the Highway 63 bottle-neck between Willow Springs and West Plains, and urges expeditious planning for 4 lane development of that entire 20 mile section of Highway 63. The hazardous results of mixing farm equipment movements with the current traffic load are obvious.

Another compounding factor, major new development at the ODC Industrial Park area north of Pomona, about midway between West Plains and Willow Springs, appears likely. Pepsi-Cola has moved their area distribution center to the park near the airport with all their trucks headquartered there. Discussions are on-going with two high-tech firms definitely moving in our direction. The two companies are involved with converting wood waste to energy, alternate fuels, and systems to improve our ecology. They are interested in up to a total of 300 acres north of Pomona with projected new employment of up to 300 people and good highway access a major prerequisite.

Local retail sales reflect the rapid expansion of travel in this area with sales increases from 1986 to 1988 of over 15 percent, 1989 saw an increase of 9.6 percent over 1988, and the first six months of 1990 increasing at a whopping 12.5 percent over 1989's booming growth. Area employment is at an all-time high with unemployment at new lows.

During this summer, our unemployment rate has dropped to as low as 4.9 percent; we're seeing people regularly driving to West Plains to shop and daily commuters to work from more than a 50 mile radius - all on single lane roads. Fall enrollment at Southwest Missouri State University - West Plains Campus is up 22 percent over last year's record high; and this is a totally mobile commuting student body, driving to West Plains from every direction. Even more growth is indicated in various Vo-Tech and nursing programs in West Plains, as the various training programs attempt to keep up with job growth opportunities.

We, of course, welcome this healthy growth, but recent traffic accident information provided this week by the Missouri State Highway Patrol paints a frightening scenario. While very recently, we have been fortunate as far as fatalities on this particular stretch of highway are concerned, emergency medical people tell us the accidents on Highway 63 between Willow Springs and West Plains generally produce major trauma - much worse than average - because they all involve highway speeds. The Highway Patrol report shows that we had 25 percent more personal injury accidents in 1989 than we saw in 1988. And at least two recent accidents involved school busses - either of which could have been a major disaster of intolerable proportions. Our area emergency vehicles have had a great deal of difficulty with traffic congestion from Highway 60 south to West Plains, and the heavy utilization of this highway by a number of the OMC medical staff - often in emergency situations - has generated great concern within the medical community.

This year as school started, the schools along this portion of U.S. 63 have a total of 38 busses moving on or across U.S. 63 twice each day. Willow Springs' 13 busses include one route that crosses U.S. 63 five times each morning and five times each afternoon. Another of their busses, twice daily, crosses at an intersection where a Missouri State Trooper was killed a few years ago making a turn on U.S. 63 while visibility was partially restricted. Richards Rural Elementary School has 8 busses working along and across U.S. 63 north of West Plains, and the West Plains R-7 district busses cross this congested highway 17 times, twice daily. Assuming an average of 30 to 40 students per bus, these movements constitute an unacceptable risk factor for tragedy.

We understand that statistics show that dual lane roads are 8 times safer than two-way traffic, and we feel the topography on this 20 mile stretch of Highway 63 could well make that ratio even more lop-sided. By 1988, traffic loads had mushroomed to far exceed all design standards for the entire twenty-plus miles. Now, the latest Missouri Highway Department traffic count number (from 1989) indicate a 10 to 12 percent increase in traffic between Willow Springs and West Plains in just that one year, and all indications are that growth is still exploding. The lowest 24 hour traffic count along that route is 8,000 and ranges up to a high of 15,754 movements per day just north of West Plains. Missouri has plans to address the most urgent needs just north of West Plains, but at least half of the 20 plus miles, plus a critical railroad crossing problem at Pomona, is all the in the "unfunded ten year study".

Clearly, our states must come up with additional revenues simply to hope to keep up with our deteriorating infrastructure, but to help our U.S. 63 immediate needs, we would hope that we might find some faster, even immediate federal help with a special project through the Highway Trust Fund. If no such emergency system is currently available, we would urge Congress to seriously work toward the inclusion of such mechanisms in the new Federal Highway Bill. The people in our area have worked very hard to pull our area out of the "economically depressed" column, only to have their efforts and resultant success threatened by the stifling effect of 20 miles of outdated, horribly overloaded and dangerous highway. Our needs and growth figures are not speculative - the area growth has already pushed highway usage on U.S. 63 between Willow Springs and West Plains to at least 160 percent of maximum planned capacity at points of lightest traffic, and at the heaviest point to more than 315 percent of planned maximum capacity. We're perched on a powder keg with a short fuse, and plead for help in our search for ways to avert disaster.

We must generate funds - we must re-think some priorities. Dollars are expendable, but the tragic potentials in LOST human lives and suffering must be addressed.

TESTIMONY FROM THE I-66 STEERING COMMITTEE BEFORE THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

This testimony is being offered for the I-66 Steering Committee and its Chairman, Mayor Bob Knight, of Wichita, Kansas. This testimony is being offered by a member of the staff of the Steering Committee:

Walter Wildman, Associate Director

Technical data supplied by Dr. Lonnie E. Haefner, of L. E. Haefner and Associates, St. Louis, MO.

We appreciate the opportunity to offer testimony on the I-66 Corridor Project. The past two years have seen a serious examination of the need for a new national statement of surface transportation policy. Several stimuli have spurred professional and trade association groups to undertake such a review and document their findings. The most relevant issues appear to be:

1. The doubling of surface travel demand by the year 2020.
2. Continued urban congestion and gridlock.
3. A fifty percent decrease in American productivity over the last decade, tied to lagging infrastructure investment.
4. Direct negative impacts of the above on our international trade processes.
5. The closing of Interstate Authorization in 1992.
6. Related needs to identify new highway corridors which serve post-interstate demographic and economic growth patterns and serve rural America's accessibility needs.
7. The need for increased highway funding to accomodate the above travel demand growth, improve our domestic productivity and effectiveness in international trade.

In light of the above, this testimonial document is a request for consideration of a 2,400 mile corridor stretching east to west across America. Termed the I-66 Corridor, it will yield significant national increase in accessibility, tourism, economic impact and intermodal avenues for international trade. The rationale for the presence of the corridor is the fact that only two major east-west flows exist to process travel across the U.S. - that of I-40 and I-70. Separated by up to 350 miles, the result is a lack of direct travel capabilities through America's heartland, linking major rural producing areas with major urban and rural centers.

Further, as the interstate authorizations draw to a close in 1992, it is appropriate to yield opportunity for a new review of America's corridor patterns. The post-interstate age must address several germane questions - How have population and activity centers shifted in the U.S. in the last decade of Interstate Construction? - What are the opportunities for growth in the future of the U.S.? - How can major highway corridors help such growth be achieved?

The approximately 2,400 mile long route is expected to originate in the vicinity of existing I-5, which is located east of the California Coastal Ranges and in the Fresno-Bakersfield Valley, and thence run eastward through Nevada, Arizona, Utah, Colorado, New Mexico, Kansas, Missouri, Illinois, Kentucky, West Virginia, with an eastern terminus in Washington, D.C., termed the northern option, or Norfolk, Virginia, termed the southern option.

Preliminary cost analysis has been performed, resulting in an initial cost range of 17-17.5 billion dollars for the route. This will be further refined with the use of detailed cost modelling by the engineering team in the near future. Significant environmental issues may arise during future detailed studies in addition to those listed in the pre-application.

The engineering cross-section associated with the alignment is that of high-type, Interstate design standards which include a 200-350 foot right-of-way, and local service frontage roads. The design speed is conceived at 70 mph, with grades and curves within acceptable Interstate standards. Originally conceived as two 12 foot lanes in each direction, it may be developed as three lanes in each direction, with one lane dedicated as exclusive truck lane. Subgrade, subbase, pavements and related geometrics would be of design and depth to accomodate heavy weight trucks sanctioned in the 1982 Surface Transportation Assistance Act (STAA). The economic benefits of such operation have been thoroughly documented in Transportation Research Board Special Report 223.

As stated earlier, a doubling of national travel demand is expected by year 2020. The presence of I-66 will reduce traffic on I-40 and I-70 by approximately one-third, and yield a longer life of useful traffic flow for those facilities. In addition, as the truck percentages in each system are expected to be in the 20-35% range, the removal of truck traffic from the stream can be expected to reduce accident rates on facilities by about 20%. This is a significant reduction.

In addition, this route allows a direct linkage of west-east deep water ports to midwest railroads, and travel from the west coast to the gulf coast and east coast ports within 1½ to 3 days from the west coast. Thus, containerized cargo and perishables can be moved intermodally by rail-water-truck or truck-rail or water-truck in a national "land bridge system" which connects the major internal and export-import break-bulk points of the nation with world markets. This movement is significantly faster than by any one mode in isolation, or deep water traverse through the Panama Canal. Such related moves have become a conventional opportunity, as Asian freight is brought to U.S. west coast ports, trucked to the midwest or east, then airlifted, barged and/or deep-sea exported from the U.S. to Europe. This represents very significant opportunities for the U.S. to become a major intermodal cargo clearinghouse for world trade movements, in addition to enhancing its own export-import flow patterns. The presence of the I-66 corridor would greatly improve tonnage across the ports of San Francisco, Oakland and Long Beach, California and enhance the above clearinghouse effect in the midwest and at east coast and gulf ports.

Finally, simple model analysis of the impact on the corridor of the proposed I-66 facility is underway through the development of multipliers. Multipliers are being developed for business activity, household income, travel expenditures, and government revenues. It is planned that future work will also include employment, property value losses and gains, and export multipliers.

Use of the above of multipliers indicate the impacts that can be experienced during and after construction of the proposed I-66 facility on counties within a 50-mile corridor. Based on preliminary analysis, the northern route option of proposed I-66 is anticipated to experience an economic impact in excess of 303.7 billion and a construction impact of 62.7 billion. The southern route option would experience an economic impact in excess of 281.5 billion and a construction impact of 64.5 billion. This is truly a significant gain, and illustrates the benefit of adequate highway corridors to GNP.

Considerably more detailed information can be obtained from the working paper and two video presentations. These documents will be made available upon request.

A Commitment To Excellence

James Wingfield

James B. Wingfield
Director Driver Marketing
Contractor Relations

I'D LIKE TO SAY A FEW WORDS OF INTRODUCTION ABOUT MY COMPANY, TRI-STATE MOTOR TRANSIT, AND OUR OPERATIONS.

TRI-STATE MOTOR TRANSIT HAS OPERATED FOR OVER 50 YEARS AS AN IRREGULAR ROUTE, HEAVY, AND SPECIALIZED MOTOR HAULER, HEADQUARTERED IN JOPLIN, MISSOURI. THE COMPANY HAS GROWN TO BECOME ONE OF THE NATION'S TOP 50 TRUCKING COMPANIES WHICH OPERATES FROM COAST TO COAST AND IS ONE OF THE PREMIER SPECIALIZED MOTOR HAULERS.

WE HAVE A BROAD RANGE OF GENERAL COMMODITY RIGHTS BETWEEN ALL POINTS IN 48 STATES. OUR FLEET IS SUPPORTED BY GOVERNMENT AND COMMERCIAL EXPLOSIVES, NUCLEAR MATERIALS, AEROSPACE GOODS, AND HEAVY OR OVER-SIZED/OVER-DIMENSIONAL LOADS.

TRI-STATE HAS APPROXIMATELY 26 TERMINALS LOCATED THROUGHOUT THE COUNTRY FROM THE WEST COAST TO THE EAST COAST, AND WE OPERATE HEAVILY IN THE UPPER AND LOWER MIDWEST. MOST NOTABLY, BESIDES OUR JOPLIN, MISSOURI HEADQUARTERS, WE HAVE TERMINALS LOCATED IN HOUSTON, TEXAS; NASH, TEXAS; KANSAS CITY, MISSOURI; SHERMAN,TEXAS; RIALTO, CALIFORNIA; AND SEATTLE, WASHINGTON.

TRI-STATE IS ONE OF THE TOP TRANSPORTERS FOR THE DEPARTMENT OF DEFENSE.

AS REGARDS OUR INPUT TO THIS COMMITTEE, I WOULD LIKE TO ADDRESS THE LONGER NATIONAL SCOPE; RELATE IT TO OUR OPERATIONS AND END BY ENDORSING A PROJECT VERY CLOSE TO HOME.

TRI-STATE MOTOR TRANSIT ENDORSES THE VIEW OF THE AMERICAN TRUCKING ASSOCIATION SUPPORTING A "HIGHWAY SYSTEM OF NATIONAL SIGNIFICANCE".

AS SET FORTH IN MR. THOMAS DONOHUE'S SUMMARY STATEMENT TO THE SUB-COMMITTEE ON SURFACE TRANSPORTATION OF THE COMMITTEE ON THE PUBLIC WORKS AND TRANSPORTATION DATED MARCH 15 OF THIS YEAR, "77 PERCENT OF ALL COMMODITIES NOW MOVES ON TRUCKS...AND A RENEWED TRANSPORTATION SYSTEM WILL UNDERGIRD OUR DRIVE TOWARD THE REBUILDING OF OUR NATION'S INDUSTRIAL STRENGTH."

FOREMOST IN THIS POSITION IS MAINTENANCE AND REBUILDING OF OUR INTERSTATE SYSTEM ADDING ADDITIONAL INTERSTATES WHERE NECESSARY.

AS WE ALL KNOW, AN HISTORICAL JUSTIFICATION FOR THE NATIONAL INTERSTATE SYSTEM WAS NATIONAL DEFENSE. AS THIS COMPANY CAN CERTAINLY ATTEST, OUR NATIONAL DEFENSE CONCERNS WERE INDEED SERVED BY THE TRANSPORTATION OF ORDINANCE AND MATERIAL TO SUPPORT OUR EFFORTS IN VIETNAM, AND MOST RECENTLY HUNDREDS OF LOADS OF MILITARY CARGO WERE SHIPPED PER DAY BY THIS COMPANY ALONE IN SUPPORT OF OUR MILITARY PRESENCE IN THE PERSIAN GULF.

CERTAINLY, MAINTENANCE OF INTERSTATE SYSTEMS, WHICH OVER THE YEARS COST MORE THAN $13 BILLION TO CONSTRUCT, MUST BE PARAMOUNT IN OUR INFRASTRUCTURE NEEDS.

ON THE COMMERCIAL SIDE, A USEFUL ILLUSTRATION MIGHT BE HELPFUL.

THIS COMPANY IS ONE OF THE NATION'S FOREMOST HAULERS IN THE AREAS OF SPECIALIZED, OVER-DIMENSIONAL COMMODITIES.

AFTER RESEARCHING THE CURRENT HIGHWAY SYSTEM WITH OUR OVER-DIMENSIONAL SPECIALISTS AT TRI-STATE, WE DISCOVERED THAT A RAPID DETERIORATION OF THE EASTERN SEABOARD INTERSTATE SYSTEM IS BECOMING EVIDENT.

BEING THE FIRST AND OLDEST OF THE INTERSTATES, IT IS NOT SURPRISING THAT THEY ARE ALSO THE MOST DILAPIDATED AND BECAUSE OF THIS, AN EROSION IMPACT HAS BEEN FELT.

FOR EXAMPLE, OUR RESEARCH INDICATES THAT IN THE PAST 2 YEARS, I-79 HAS BEEN SHUT TO OVER-DIMENSIONAL TRAFFIC AT 3 POINTS IN WEST VIRGINIA, I-64 HAS BEEN SHUT TO O.D. TRAFFIC IN WEST VIRGINIA, SECTIONS OF INTERSTATE 64 IN EASTERN KENTUCKY CANNOT ACCOMODATE OVER-DIMENSIONAL TRAFFIC, SECTIONS OF INTERSTATE 70 REROUTING HAS CAUSED HUNDREDS AND HUNDREDS OF MILES OF DETOURS. THERE ARE SEVERAL OTHER EXAMPLES.

MOST OF THESE RESTRICTIONS HAVE BEEN RECENT, AND ARE THE RESULT OF SIMPLE DECAY. LITERALLY, SOME AREAS OF THE NORTHEAST CANNOT ANY LONGER BE REACHED WITH OVER-DIMENSIONAL CARGO. OUR ESTIMATES ARE THAT WE HAVE TO REFUSE 15 TO 20 PERCENT OF THE SHIPPING REQUESTS TO THE NORTHEAST BECAUSE OF THESE RESTRICTIONS, THEREBY HAMPERING MIDWESTERN AND WESTERN SHIPPERS WISHING TO SERVE THE EASTERN SEABOARD.

BY ENDORSING THE BASIC PURVIEW OF, THE ATA'S CALL FOR A "HIGHWAY SYSTEM OF NATIONAL SIGNIFICANCE", NOT ONLY THE INTERSTATE SYSTEM COULD BE ENHANCED, BUT OTHER NATIONAL

ARTERIAL SYSTEM ROUTINGS COULD BE JUSTIFIABLY IMPROVED AS WELL.

THIS ASPECT OF THE NEWLY PROPOSED HIGHWAY PROGRAM WOULD ALLOW FOR PROJECTS SUCH AS THE HIGHWAY 71, 4-LANE PROJECT WHICH COULD PROVIDE A VASTLY NEEDED NORTH-SOUTH ARTERIAL ROUTE FROM SOUTH TEXAS TO THE CANADIAN BORDER. THIS IS A PROJECT NEAR AND DEAR TO OUR HEARTS, GIVEN OUR PROXIMITY TO THE CURRENT 71 HIGHWAY.

SOME FIND IT IRONIC THAT WHILE IT WOULD APPEAR THAT THIS PARTICULAR U.S. HIGHWAY ROUTING WOULD BE HEAVILY TRAVELED BY OUR COMPANY, SUCH IS NOT THE CASE. FOR INSTANCE, DUE TO HEAVY CONGESTION ON ITS 2-LANE PORTIONS, AND THE LACK OF LIMITED ACCESS, TRI-STATE REFUSES TO USE THIS ARTERY SOUTH OF JOPLIN FOR EXPLOSIVE SHIPMENTS, EVEN THOUGH IT IS AN ACCEPTABLE ROUTE.

FOR SAFETY CONCERNS, WE OPT INSTEAD TO UTILIZE THE INDIAN NATIONS TURNPIKE IN WESTERN OKLAHOMA, EVEN THOUGH IT RESULTS IN COSTLY HOURS OUT OF ROUTE.

FOR THE SAME REASONS, AND DUE TO MANY OLDER RAILROAD OVERPASSES AND OTHER OVERHANGING STRUCTURES, FEW OVER-DIMENSIONAL--OVER-HEIGHTH LOADS CAN BE USED ON THIS CORRIDOR AS WELL.

ALL OF US WHO ARE INVOLVED IN LONG-DISTANCE TRUCKING IN THE AREA SUPPORT THE 4-LANE 71 PROJECT OR THE "INTERSTATE 59" PROJECT AS IT IS CALLED IN THE SOUTHERN STATES. IT IS, HOWEVER, BUT ONE OF SEVERAL OTHER POTENTIAL EXAMPLES OF MUCH

NEEDED U.S. ARTERIAL IMPROVEMENTS WHICH COULD BE AFFECTED UNDER A NEW HIGHWAY PLAN.

IN CLOSING, I WOULD LIKE TO THANK THIS HONORABLE PANEL FOR THE OPPORTUNITY TO EXPRESS SOME OF OUR INDUSTRY'S CONCERN.

RE: United States House of Representatives Public Works
and Transportation Committee Field Hearing

Dear Congressman Hancock:

At present, septic tank usage, municipal and industrial rainfall runoff, sewage treatment plant discharges, landfill sitting and leachate, and other related water quality issues are being treated separately by local and county governments. Public concern over water quality is high and is also generally treating these various, interrelated issues as if they were separate. These issues need to be addressed in a systematic fashion by all levels of government.

In the late 1980's, under authority in the Water Resources Development Act of 1986, the U.S. Army Corps of Engineers did a study of the Beaver Lake drainage in northwest Arkansas. Based on the data developed, they recommended various changes that could be made to improve water quality in that area.

Quite a bit of historic water quality data has been collected in Southwest Missouri by various federal and state agencies. In Greene County we are actively pursuing water quality investigations on several fronts--including wellhead protection studies and inventories, underground storage tank removal and certification, watershed protection and preservation, area wide wastewater facilities planning, and stormwater quality management. Other studies are in development stages in surrounding counties, but unfortunately this information is somewhat piecemeal and uncoordinated. We are looking for a program from which a coordinated effort may emenate.

Present and projected impacts on water quality in this region from rapid growth in agribusiness, recreation, retirement and major population centers needs to be determined. Local and County governments need this data catalogued and developed in a systematic manner so they can make comprehensive planning and decisions based on factual information.

The Honorable Mel Hancock
August 30, 1990
Page 2

Commissioners from several counties in this area of Missouri have met with representatives from the Corps of Engineers and discussed this matter. They explained that the water quality study of Beaver Lake was a result of public involvement with their congressional delegation. We are very interested in getting this kind of help in addressing our regional water quality concerns.

Sincerely,

H Compton

TESTIMONY SUBMITTED BY
THE MISSOURI ASSOCIATION OF COUNTIES
BEFORE THE U.S. HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

"THE FUTURE OF OUR NATION'S INFRASTRUCTURE"

Springfield, Missouri
August 31, 1990

Mr. Chairman, and honorable members of the House Committee on Public Works and Transportation, the Missouri Association of Counties is extremely pleased to have the opportunity to provide input into your field hearings on the nation's infrastructure. While we recognize that the committee will be looking at all aspects of the country's infrastructure, our comments will be focused on Missouri's large county transportation network -- a network that is literally crumbling before our eyes.

Missouri county government has an enormous responsibility in attempting to maintain the largest transportation network in the state. Counties are responsible for approximately 70,000 miles of road (roughly 60% of all roads in the state) and 12,800 "off-system" bridges over 20 feet in length (55% of all bridges over 20 feet long in the state). The county bridge system is in a particularly dangerous condition. Based on federal criteria, 94% of these bridges are either structurally deficient or functionally obsolete. Many have been closed due to age and wear and a number have simply collapsed from decay. County bridges, while not carrying vast amounts of traffic, nonetheless are vital links in the overall transportation network. They connect rural and urban areas, carry school buses and emergency vehicles, and transport agricultural products from farm to market. These products are vital to the economic well-being of the state as a whole. Economic development, tourism, and agriculture industries are extremely dependent on a well-maintained transportation system. Missouri ranks 17th in the country in tourism and 10th nationally in exporting agricultural commodities. If the county bridge system is not rebuilt, these very important industries and Missouri's overall economy will certainly suffer.

In terms of dollars, the Missouri county "off-system" bridge network alone needs an **ADDITIONAL $120 MILLION ANNUALLY OVER THE NEXT TEN YEARS** just to "catch up" with the incredible backlog of bridgework. The state as a whole will need almost **FIVE TIMES** that much over the same period to meet unfunded highway needs. Clearly, state and local officials will not have the luxury of seeing those kinds of revenues forthcoming. That being the case, it is imperative that the revenues that are available are spent in the most prudent and equitable manner possible.

Federal mandates are, however, making it difficult for county officials to get the most out of the money that is available. "National Bridge Inspection Standards" recently imposed by the Federal Highway Administration are a prime example of the unfunded mandate issue. The new standards require political entities to identify and then inspect fracture critical and scour critical bridges. The required inspections could conceivably take the vast majority of the federal bridge monies allocated to counties (currently $13 million annually), thereby leaving virtually nothing for actual bridge repair and replacement.

Another problem area is the inability of many counties to come up with the necessary match money needed for an 80/20 federal highway project under the federal bridge replacement program. While progress has been made since the inception of the program, building a bridge under federal constraints is an extremely slow and cumbersome process. Common criticisms from local officials include (1) excessive paperwork which commonly causes the time to complete a bridge to exceed three years; (2) costs under the federal program are excessive and exceed the cost of an identical nonprogram bridge by 33 percent; and (3) the Davis-Bacon Act which has a tendency to inflate the cost of county projects. Considering the critical shortage of highway funds, it is unacceptable to waste both time and money on bureaucratic red tape. A relaxation of cumbersome federal standards and a greater amount of local flexibility in the spending of available federal funds would be a tremendous step in the right direction.

It is refreshing to note that the U.S. Department of Transportation apparently agrees with our view. In Moving America, a statement of national transportation policy issued in February of this year, the department cited the fostering of state and local initiatives as a means to an end of providing a sound financial base for transportation: "The federal government must provide additional flexibility to state and local governments in making use of federal transportation funds.... Rigid federal standards governing the way that federal-aid monies can be used or the specific way that federal-aid facilities must be built can impose unnecessary costs and prevent state and local governments from pursuing the most cost-effective options."

Mr. Chairman, your committee and the members of the U.S. Congress will consider the reauthorization of the Federal Surface Transportation Act within the next year. We respectfully ask that Congress act in a timely fashion by reauthorizing a new act prior to the October 1, 1991, deadline. The needs are simply too great not to do so. The American Association of State Highway and Transportation Officials (AASHTO) and the Federal Highway Administration (FHWA) are presently working on what will hopefully be the next federal highway act. The AASHTO plan would reallocate some of these federal highway funds and give Missouri approximately $200 million more per year in badly needed revenues. Missourians currently pay 2.6% of all federal motor fuel tax revenues collected, yet our state receives a great deal less than what our motorists invest. In fact, Missouri has gotten back at least what it has paid in only twice in the last 30 years. Missouri is a transportation "hub" with numerous interstate and major highways transversing our borders. According to a recent TRIP (The Road Information Program) study, Missouri ranks first in the number of vehicle miles traveled in the seven state West North Central Region.

Clearly our significant state and local needs warrant an increased allocation, to say nothing of the fact that it is time that Missouri receives its fair share.

Mr.Chairman, we know that you and your colleagues in Congress are faced with meeting very difficult federal budget targets in the next thirty days. We are fully aware that the federal deficit problem is of grave concern and that drastic steps need to be taken to reduce the deficit. However, we do not believe that the money in the Highway Trust Fund should be "held hostage" for deficit-reduction purposes, nor do we believe that an increase in the federal gasoline tax should be used to help offset the national debt. The Missouri Association of Counties is on record in opposition to the latter (see attachment A). Any increase in the motor fuel tax must be spent for what it was intended -- highway and bridge improvements. Likewise, a sequestration of highway funds in an attempt to meet deficit reduction targets by October 1 of this year would be crippling to transportation efforts not only in our state, but across the nation. WE STRONGLY urge you to look at other options.

Mr. Chairman, the cost of inaction is far too great. The state and local highway system in Missouri CANNOT withstand another period of neglect. We respectfully ask that you take the necessary action to see that adequate federal highway funds are forthcoming in the critical years ahead. Thank you for your consideration.

ATTATCHMENT A

RESOLUTION IN OPPOSITION TO INCREASING THE FEDERAL GASOLINE TAX TO REDUCE THE FEDERAL DEFICIT

WHEREAS, there continue to be proposals introduced in the United States Congress to seek increased federal motor fuel taxes to help reduce the federal deficit, and

WHEREAS, such proposals would be devastating to the viability of the Highway Trust Fund and to local road and bridge programs financed to a large extent from dedicated motor fuel taxes, and

WHEREAS, such proposals would destroy the long-standing concept of motor fuel taxation as a direct user fee dedicated to transportation improvement, and

WHEREAS, federal tax increases on motor fuel serve to preclude voter approval of needed state motor fuel tax increases,

THEREFORE, BE IT RESOLVED, the Missouri Association of Counties does hereby go on record as being opposed to raising the federal motor fuel tax for deficit reduction purposes and urges the members of the Missouri Congressional delegation to oppose this idea and support continued dedication of all federal motor fuel tax revenues to the Highway Trust Fund, and

BE IT FURTHER RESOLVED, that the executive director of the Association be requested to furnish a copy of this resolution to each member of the Missouri Congressional delegation and the board of directors of the National Association of Counties.

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

SATURDAY, SEPTEMBER 8, 1990

HOUSE OF REPRESENTATIVES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Springdale, AR.

The committee met, pursuant to notice, at 9 a.m., in Salon C, Holiday Inn, Springdale, AR, Hon. Glenn M. Anderson (chairman of the committee) presiding.

Present. Representatives Anderson, Roe, Mineta, Rahall, Laughlin, Hammerschmidt, Shuster, McEwen, Petri, Packard, Lightfoot, Inhofe, Emerson, and Hancock.

The CHAIRMAN. Good morning. The Committee on Public Works and Transportation Regional Hearing on the future of our Nation's infrastructure will come to order.

It is a great pleasure for our Committee to be here in Northwest Arkansas today. We will be hearing testimony from an impressive group of witnesses, and I know that this is going to be an extremely productive hearing, and before I yield to my colleague from Arkansas, Congressman John Paul Hammerschmidt, I just want to express my appreciation to him for his continuing leadership and valuable contributions to the Committee's efforts to address our Nation's pressing infrastructure needs.

I especially want to thank him for recommending back in February that we hold this hearing in Northwest Arkansas. It is a perfect setting for us to look at the infrastructure in a rapid growth region of rural America, and of course, no one would know that better than John Paul Hammerschmidt.

For more than two decades, he has been extremely attentive to the needs of this area, and I can see why Highway 71 receives so much attention in Washington, when ordinarily such a project would be almost exclusively a state responsibility. Congressman Hammerschmidt has seen to it that the project is a federal priority as well, and one that enjoys full federal support. I can also fully understand why both Houses of the Arkansas Legislature unanimously passed, and the Governor signed into law, legislation naming Highway 71 for Congressman John Paul Hammerschmidt. After all that he has done for this very important project, it is certainly appropriate that the highway should bear his name.

As much as John Paul has done for this District, the State of Arkansas, and our Nation, there is something I would be remiss if I did not add, and that is that John Paul Hammerschmidt is a great and good friend of mine of long-standing. He is warm and decent, and a fine individual, and I'm certain that these qualities and the fact that all who know him consider him a friend, have helped him to be the outstanding legislator that he is, and to achieve all that he has achieved.

Therefore, at this time, I am pleased to recognize my good friend, the Honorable John Paul Hammerschmidt, who will introduce the Members of the committee with us today.

John Paul?

Mr. HAMMERSCHMIDT. Thank you very much, Mr. Chairman. I deeply appreciate your very generous remarks, and I want to thank you and the other Members of the Public Works and Transportation Committee who have taken time out of their schedules to attend today's hearings and to enjoy some of Arkansas' good hospitality.

Normally, we don't introduce Members, we just introduce witnesses, but we are going to make an exception today, so I will introduce the Chairman and ranking Members first, and as I introduce each Member, it would be helpful for our audience if you would raise your hand.

Joining us today are, of course, our fine Chairman Congressman Glenn Anderson from Hawthorne, California. Chairman Anderson has served on our committee with great distinction for more than two decades. He has provided great leadership in developing our committee's very substantial record in support of a strong national public works and transportation infrastructure. Mr. Chairman.

Congressman Bob Roe of Wayne, New Jersey, is one of the most senior Members of the committee. He has served very ably for many years as Chairman of our Water Resources Subcommittee, and is now the distinguished Chairman of the House Science, Space and Technology Committee. Bob.

Mr. ROE. Thank you.

Mr. HAMMERSCHMIDT. Congressman Norm Mineta of San Jose, California, has long been a prominent and highly respected leader on our committee. He has served for a number of years as Chairman of our Aviation Subcommittee and is now Chairman of our Surface Transportation Subcommittee. Norm.

Congressman Bud Shuster of Everett, Pennsylvania, is another of our very distinguished senior Members. He has served very effectively as the ranking Member of our Surface Transportation Subcommittee for the past 15 years.

Congressman Nick Joe Rahall of Beckley, West Virginia, is one of our senior Members who serves on our Surface Transportation and Economic Development Subcommittee. He also chairs the Mining and Natural Resources Subcommittee of the House Interior and Ancillary Affairs Committee. Nick Joe.

Congressman Bob McEwen of Hillsboro, Ohio, is a very skillful ranking Member on our Investigation and Oversight Subcommittee. He has previously served as a ranking Member on the Public Buildings and Grounds Subcommittee.

Congressman Tom Petri of Fond Du Lac, Wisconsin, is our very able ranking Member on the Public Buildings and Grounds Subcommittee.

Congressman Ron Packard of Ocean Side, California, is a greatly respected ranking Member on our Economic Development Subcommittee.

Congressman Jim Ross Lightfoot of Shenandoah, Iowa, serves very effectively on our Aviation, Water Resources, and Public Buildings and Grounds Subcommittee.

Congressman Greg Laughlin from West Columbia, Texas, is an important Member of our Aviation, Surface Transportation and Water Resources Subcommittee.

Congressman Jim Inhofe, our neighbor from Tulsa, Oklahoma, former Mayor there, is a very capable Member of our Aviation Investigation and Oversight Public Buildings and Grounds and Water Resources Subcommittee.

Congressman Bill Emerson is another neighbor from Cape Girardeau, Missouri. He serves with great distinction on our Economic Development Surface Transportation and Water Resources Subcommittee.

And last, but certainly not least, Congressman Mel Hancock from nearby Springfield, Missouri, our neighbor to the north, is a very valuable Member of our Aviation and Surface Transportation and Water Resources Subcommittee.

So, I'm delighted that my colleagues have joined us today. I'm confident that this will be a very productive hearing for all of us, Mr. Chairman, and I thank you very much.

[The prepared statement of Mr. Hammerschmidt follows:]

REMARKS BY HON. JOHN PAUL HAMMERSCHMIDT
INFRASTRUCTURE NEEDS HEARING
SPRINGDALE, ARKANSAS
SEPTEMBER 8, 1990

THANK YOU, MR. CHAIRMAN.

I WANT TO COMMEND YOU FOR YOUR STRONG LEADERSHIP IN SETTING OUR COMMITTEE'S ACTIVE AGENDA TO ADDRESS THE NATION'S INFRASTRUCTURE NEEDS AND FOR SCHEDULING TODAY'S HEARING. AGAIN, I WANT TO WELCOME MY COMMITTEE COLLEAGUES AND THE DISTINGUISHED WITNESSES WHO WILL BE TESTIFYING, AND ALL OF OUR GUESTS IN THE AUDIENCE TODAY.

WHEN CHAIRMAN ANDERSON AND I FIRST DISCUSSED THIS SERIES OF HEARINGS EARLIER THIS YEAR, WE AGREED THAT IN ADDITION TO OUR EXAMINATION OF URBAN INFRASTRUCTURE NEEDS, IT WOULD BE IMPORTANT AS WELL THAT WE LOOK INTO THE INFRASTRUCTURE NEEDS OF RURAL AMERICA. AND WE ARE DOING JUST THAT.

IN FACT, OUT OF THE 15 OR SO INFRASTRUCTURE HEARINGS WE ARE HOLDING NATIONALLY, THREE OF THOSE ARE IN THIS REGION, WHICH IS LARGELY RURAL AND HAS COMMON INTERESTS. TODAY'S HEARING IS ACTUALLY THE CULMINATION OF THIS SET OF HEARINGS, WHICH WE BEGAN SOME 10 DAYS AGO IN TULSA, OKLAHOMA, AND SPRINGFIELD, MISSOURI, WHICH ARE SO ABLY REPRESENTED BY CONGRESSMAN JIM INHOFE AND CONGRESSMAN MEL HANCOCK RESPECTIVELY.

I SUGGESTED THAT WE COME TO NORTHWEST ARKANSAS BECAUSE I FELT THAT IT WOULD BE IDEAL FOR OUR PURPOSES. IT IS A VIBRANT REGION OF THE NATION AND LARGELY RURAL, WITH A GROWTH RATE THAT HAS ACTUALLY OUTSTRIPPED ITS INFRASTRUCTURE.

MR. CHAIRMAN, YOU HAVE VERY ABLY OUTLINED OUR NATIONAL GOALS WITH RESPECT TO REBUILDING THE NATION'S INFRASTRUCTURE, AND I CERTAINLY SHARE YOUR CONCERN ABOUT THE LEVEL OF DETERIORATION IN AMERICA'S NETWORK OF ROADS, BRIDGES, AIRPORTS, AND WATER SUPPLY, SEWAGE TREATMENT AND SOLID WASTE DISPOSAL FACILITIES. WE HAVE AN ENORMOUS JOB AHEAD OF US NATIONWIDE, AND ONE THAT WILL REQUIRE A MAJOR FINANCIAL INVESTMENT.

HERE IN ARKANSAS, WE WILL BE LOOKING AT THE CORE INFRASTRUCTURE NEEDS--SURFACE TRANSPORTATION, AVIATION, WATER RESOURCES, WATER POLLUTION, AND SOLID WASTE DISPOSAL. WE WANT TO BE ABLE TO MEET ALL OF OUR NEEDS IN EACH OF THESE AREAS AND IN A MANNER THAT IS FISCALLY SOUND AND ENVIRONMENTALLY RESPONSIBLE. FORTUNATELY, AS WE STRIVE TO MEET THESE NEEDS, WE DO HAVE IN PLACE AND AT WORK A STRONG FEDERAL-STATE-LOCAL AND PRIVATE PARTNERSHIP HERE IN ARKANSAS.

AT THE STATE LEVEL, THE STATE HIGHWAY COMMISSION, THE ARKANSAS HIGHWAY AND TRANSPORTATION DEPARTMENT, THE ARKANSAS AERONAUTICS COMMISSION, THE DEPARTMENT OF AERONAUTICS, THE SOIL

AND WATER RESOURCES COMMISSION, AND THE ECONOMIC DEVELOPMENT DISTRICTS DO A TREMENDOUS JOB IN DEVELOPING AND IMPROVING THE STATE'S INFRASTRUCTURE.

A NUMBER OF FEDERAL AGENCIES ALSO PLAY AN IMPORTANT ROLE IN INFRASTRUCTURE BUILDING AND REBUILDING, INCLUDING THE FEDERAL HIGHWAY ADMINISTRATION, FEDERAL AVIATION ADMINISTRATION, SOIL CONSERVATION SERVICE, CORPS OF ENGINEERS, ENVIRONMENTAL PROTECTION AGENCY, AND THE FARMERS HOME ADMINISTRATION.

OUR LOCAL CITY AND COUNTY GOVERNMENTS AND CHAMBERS OF COMMERCE ARE ALSO ON THE FRONT LINES IN THIS EFFORT. AND THEY GET EXTREMELY IMPORTANT SUPPORT FROM THE MANY CONCERNED CITIZENS IN THE PRIVATE SECTOR, WHO ARE ALSO ACTIVELY INVOLVED IN THE PROCESS.

IN THAT REGARD, WE ARE ESPECIALLY DELIGHTED TO HAVE WITH US TODAY MEMBERS OF THE NORTHWEST ARKANSAS COUNCIL, A NEWLY FORMED REGIONAL ORGANIZATION THAT IS WORKING HARD FOR AN IMPROVED TRANSPORTATION SYSTEM IN THIS REGION. THE DISTINGUISHED COUNCIL MEMBERS JOINING US TODAY INCLUDE DON TYSON, SAM WALTON, J.B. HUNT, ALICE WALTON, AND JIM BLAIR.

IN FACT, ALL LEVELS OF GOVERNMENT AND THE PRIVATE SECTOR WILL BE REPRESENTED AT THE WITNESS TABLE TODAY. JOINING US FROM WASHINGTON ARE DR. THOMAS LARSON, ADMINISTRATOR OF THE FEDERAL HIGHWAY ADMINISTRATION, AND LEONARD GRIGGS, ASSOCIATE ADMINISTRATOR FOR AIRPORTS WITH THE FAA; AND FROM DALLAS, BRIG. GEN. STANLEY GENEGA, THE CORPS OF ENGINEERS' SOUTHWEST DIVISION ENGINEER.

WE KNOW, OF COURSE, THAT THIS COMMITTEE HAS NOT COME TO ARKANSAS TO SOLVE ALL OF OUR STATE'S INFRASTRUCTURE PROBLEMS. THESE PROBLEMS ARE NOW PRIMARILY UNDER THE AUTHORITY OF STATE AGENCIES, ALTHOUGH WE HAVE MAJOR FEDERAL PROGRAMS THAT PROVIDE STATES WITH ASSISTANCE TO HELP IN ALL OF THESE AREAS. THIS HEARING IS REALLY PART OF AN EFFORT TO DEVELOP AN OVERALL NATIONAL STRATEGY ON HOW TO BEST IMPROVE AND MAINTAIN OUR NATION'S INFRASTRUCTURE.

HOWEVER, I KNOW THAT LOCALLY, INTEREST HAS BEEN EXPRESSED IN PURSUING THE FEASIBILITY OF A REGIONAL AIRPORT, AND CERTAINLY THIS MIGHT BE AN IDEAL PLACE FOR THE FEDERAL GOVERNMENT TO BE CLOSELY INVOLVED IN PLANNING AND FINANCING.

IN ADDITION, THE COMMITTEE WILL BE TAKING A CLOSER LOOK AT SURFACE TRANSPORTATION IN NORTHWEST ARKANSAS DURING THE HEARING WE HAVE SCHEDULED FOR EARLY NEXT MONTH IN FORT SMITH.

THAT HEARING WILL ALLOW THE ADDITIONAL OPPORTUNITY TO DISCUSS A NUMBER OF ISSUES THAT I KNOW WILL BE BROUGHT UP HERE TODAY, INCLUDING THE HIGHWAY 71 CORRIDOR, WHICH RUNS FROM I-40 NORTH TO THE ARKANSAS-MISSOURI STATE LINE, AND THE HIGHWAY 412 CORRIDOR, THE EAST-WEST FOUR-LANE ROUTE THAT CROSSES THE NORTHERN PART OF ARKANSAS.

I ESPECIALLY WANT TO CONGRATULATE THE ARKANSAS HIGHWAY DEPARTMENT ON THE GREAT PROGRESS THEY HAVE MADE AND THE AMOUNT OF FUNDING THEY HAVE BEEN ABLE TO DEVOTE TO HIGHWAY 71, GIVEN THE ADDITIONAL FUNDS THAT HAVE BEEN MADE AVAILABLE TO ARKANSAS BY THE FEDERAL GOVERNMENT IN RECENT YEARS.

I ALSO WANT TO COMMEND THE DEPARTMENT FOR USING ALL OF THEIR OBLIGATIONAL AUTHORITY IN 1990, WHICH ALLOWED THE STATE TO RECEIVE AN ADDITIONAL $7 MILLION IN REDISTRIBUTED OBLIGATIONAL AUTHORITY IN AUGUST.

NEXT MONTH'S FORT SMITH HEARING WILL BE ANOTHER IN THE SERIES OF SUCH HEARINGS BEING CONDUCTED BY OUR SURFACE TRANSPORTATION SUBCOMMITTEE IN PREPARATION FOR DRAFTING THE NEXT MAJOR HIGHWAY BILL.

I MIGHT ADD THAT IN THAT HEARING, AS WELL AS TODAY'S HEARING, WE WILL BE LOOKING AT NEW AND INNOVATIVE WAYS TO FINANCE OUR INFRASTRUCTURE NEEDS. ONE OPTION WOULD BE TO ALLOW THE USE OF TOLLS ON NEW FEDERAL-AID HIGHWAYS. ALLOWING SUCH TOLLS ON NEW HIGHWAYS MAY BE ONE OF THE WAYS TO MEET THE NEED FOR NEW HIGHWAY CONSTRUCTION, ESPECIALLY GIVEN THE CURRENT BUDGETARY CONSTRAINTS. I SEE A GREAT DEAL OF MERIT IN THIS, AND I AM ACTIVELY PURSUING THE POSSIBILITY OF HAVING THIS CONCEPT INCLUDED IN NEXT YEAR'S HIGHWAY REAUTHORIZATION BILL.

AGAIN, I WANT TO THANK YOU, MR. CHAIRMAN, FOR CONVENING THIS HEARING TODAY, AND I LOOK FORWARD TO HEARING THE TESTIMONY OF OUR DISTINGUISHED WITNESSES.

The **Chairman**. Thank you, John Paul, and I, too, want to join with you on welcoming so many Members to this morning's hearing. It is truly a testament, not only to the infrastructure issue itself, but to your leadership and hard work in making this hearing possible, and inviting us.

Now, this year our Committee has been examining many aspects of the infrastructure issue, seeking a better understanding about our Nation's public work crisis.

We have explored emerging infrastructure needs from the national perspective, and reviewed the impact of infrastructure on private investment and on the ability of the United States to compete in international markets. We also plan to look at infrastructure financing alternatives and new technologies.

It is important, however, that we understand the kinds of infrastructure problems that are being experienced at the local levels, and so we have embarked on a series of hearings at various sites around the Nation to talk with you, the people most directly involved with our infrastructure.

Let me tell you why infrastructure is a national priority, and the answer is, our economy.

The United States is fifty-fifth in the world in capital investment. Japan spends five times more than we do on infrastructure, and West Germany's annual productivity rate is three times our's.

Infrastructure is not just potholes, it's productivity. Infrastructure is not only concrete, it's competitiveness—yet what we see today is a system of peril and not pride.

Sixty percent of our highways and 41 percent of our bridges are in need of work. Traffic congestion has increased over 50 percent in the last 10 years. In our Nation's largest urban areas, two billion hours of time are lost annually, and if you're delayed 20 minutes each day in rush hour, by the end of your career, you will have wasted two working years.

By the year 2000, traffic delays caused by inadequate roads, will cost $50 billion in lost wages on wasted gasoline.

No new airport has been built in this country since 1974.

Many of our urban water systems are over 100 years old and lose as much water as they move.

Countless jobs are being lost and, according to the Rebuild America Coalition, in Arkansas alone, 17 percent of all paved rural highway miles in the state, 14 percent of urban highways and streets, and 25 percent of highway bridges are rated as deficient, and it's not just highways or bridges, and it's not just Arkansas. This is a national problem of alarming dimensions.

Because of this, we are looking to you to help us to gain further insight into our infrastructure needs.

The question today is, what is the condition of the infrastructure in Arkansas, particularly this region of the state? Are your roads, bridges, public buildings, sewers, waste water treatment plants, water supply facilities, and other basic services, adequate to meet the current and anticipated needs of this area, and if not, what can be done, and by whom?

We look forward to today's hearing to answer these and other questions.

Now, I would like to recognize other Members for brief opening remarks that they may wish to make.

Mr. MINETA. Mr. Chairman, if I might?

The CHAIRMAN. Mr. Mineta?

Mr. MINETA. Is Mr. Hammerschmidt going to make opening remarks other than——

The CHAIRMAN. Mr. Hammerschmidt?

Mr. HAMMERSCHMIDT. I yield to the distinguished gentleman from California, and then I'll make mine.

Mr. MINETA. Thank you very much.

Mr. Chairman, I want to applaud you for your leadership for holding these hearings, but frankly, the fact that there are 14 Members of the Congress who have come to Springdale, is really a reflection of the love and respect frankly that we have for Congressman John Paul Hammerschmidt. You wouldn't have this kind of a turnout for any other Member of Congress.

Mr. Chairman, as you have already pointed out, our Nation's infrastructure must be prevented from crumbling into ruins.

As the Public Works and Transportation Committee deliberates the status of America's infrastructure, we will be focusing on how to preserve our Nation's competitiveness in an international global marketplace, and more importantly, trying to preserve our quality of life into the twenty-first century.

The key question that must be answered is, what must the Congress do to rebuild America? Today, we take that first step toward finding the solution.

A sound American infrastructure is absolutely essential, if the United States is to flourish in the 1990's and into the twenty-first century. A sound American infrastructure will bolster our international competitiveness, foster economic development in terms of state and Local Government, improve public safety, and enhance our public quality of life.

When we mention infrastructure, the tendency is to think roads, bridges, mass transportation, airports, waterways, water supply, waste water treatment and solid waste disposal systems. However, make no mistake about it, an essential element of the Nation's infrastructure will focus on a sound network of transportation system.

Meeting our transportation needs is a substantial challenge. We are not only concerned about the future, but about playing catch-up ball on the Nation's unmet needs.

Net public investment by local, state and Federal Government, in terms of transportation infrastructure, averaged 2.3 percent of GNP in the 1960 and the 1970's. In the 1980's, that dropped to four-tenths of one percent.

Meanwhile, urban and rural traffic congestion has increased by over 50 percent since 1980, and what's worse is that a recent study by the General Accounting Office, predicts that delays on urban freeways will increase 436 percent by the year 2005, and then you take areas that are starting to develop like the northwest area of Arkansas, and you see the rapid growth here, and then you wonder, is there any reason why the kinds of problems we're facing are not only local but national in terms of half of our bridges being deficient or functionally obsolete.

More than a million miles of highways will need to be resurfaced in the next 10 years alone, and all the while, Federal Highway expenditures have been on the decline, and so we have to reverse that also in terms of mass transit funding.

Under funding these programs may have made sense in terms of some short term fiscal relief, but over the long haul, we have crippled our ability to compete by inadvertently denying America's businesses and the American people to a fully functional transportation system.

The bottom line is this. We must invest and invest quickly and wisely in our transportation infrastructure before it is too late, and that is why so many of our Subcommittee Members from the Subcommittee on Surface Transportation are participating in these hearings, Mr. Chairman, with you, and with Mr. Hammerschmidt, because our Subcommittee, with the great help of my very very fine colleague, Congressman Bud Shuster of Pennsylvania, will continue under your leadership, Mr. Chairman, and Mr. Hammerschmidt, to develop comprehensive legislation to reauthorize the Surface Transportation Program for the twenty-first century, and our focus will be on preserving our Nation's infrastructure.

The truth is, Mr. Chairman, that we must invest in the future if we are to compete in the world marketplace.

Again, Mr. Chairman, to you and Mr. Hammerschmidt, my thanks for your leadership in having these hearings across the country.

The CHAIRMAN. Thank you, Norm. John Paul?

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman. Let me digress for a moment by apologizing to those of you standing in the back of the room, because this is the largest room we could get. I'm sorry that we don't have seats for everyone. We appreciate your attendance very much.

If the witnesses and others will bear with us for a few minutes, we've got a few opening statements, and I have two or three minutes of opening statement remarks. But then after that, we're going to be good listeners, because we know we have some very important people to listen to.

I want to thank you my distinguished friend from San Jose, California, Mr. Mineta, for his kind remarks, and to comment--I don't know whether—I don't—I'm doing this without his permission, but tentatively we have some Surface Transportation hearings set up here in Arkansas for October 6th if nothing slips, and things in Congress have a way of slipping. But if nothing slips, why we're looking forward to his leadership on those hearings in Fort Smith on October 6th. So, we will be pursuing the Surface Transportation segment of infrastructure further, at that time.

Mr. Chairman, I want to commend you for your strong leadership in setting our committee active Agency to address the Nation's infrastructure needs and for scheduling today's hearings. Again, I want to welcome my committee colleagues and the distinguished witnesses who will be testifying, and all of our guests in the audience today.

When Chairman Anderson and I first discussed this series of hearings earlier this year, we agreed that in addition to our examination of urban infrastructure needs, it would be important as well that we look into the infrastructure needs of rural America. And we are doing just that.

In fact, out of the 15 or so infrastructure hearings we are holding nationally, three of those are in this region, which is largely rural and which has common interests. Today's hearing is actually the culmination of this set of hearings which we began some 10 days ago in Tulsa, Oklahoma, and Springfield, Missouri, which were so ably represented by Congressman Jim Inhofe and Congressman Mel Hancock, respectively.

So, I suggested that we come to Northwest Arkansas because I felt that it would be ideal for our purposes. It is a vibrant region of the Nation, large rural, with a growth rate that has actually outstripped its infrastructure.

Mr. Chairman, you have very ably outlined our national goals with respect to rebuilding the Nation's infrastructure, and I certainly share your concern about the level of deterioration in America's network of roads, bridges, airports, and water supply, sewage treatment and solid waste disposal facilities. We have an enormous job ahead of us nationwide, and one that will require a major financial investment.

Here in Arkansas, we will be looking at the core infrastructure needs—surface transportation, aviation, water resources, water pollution, and solid waste disposal. We want to be able to meet all of our needs in each of these areas, and in a manner that is fiscally sound and environmentally responsible. Fortunately, as we strive to meet these needs, we do have in place and at work, a strong federal, state, local and private partnership here in Arkansas.

At the state level, the State Highway Commission, the Arkansas Highway and Transportation Department, the Arkansas Aeronautics Commission, the Department of Aeronautics, the Soil and Water Resources Commission, and the Economic Development Districts do a tremendous job in developing and improving the state's infrastructure.

A number of federal agencies also play an important role in infrastructure building and rebuilding, including the Federal Highway Administration, the Federal Aviation Administration, the Soil Conservation Service, the Corps of Engineers, the Environmental Protection Agency, and the Farmers Home Administration. Our Local, City and County Governments and Chambers of Commerce are also on the front lines in this effort, and they get extremely important support from the many concerned citizens in the private sector, who are also actively involved in the process.

In that regard, we are especially delighted to have with us today, members of the Northwest Arkansas Council, a newly formed regional organization that is working hard for an improved transportation system in this region. The distinguished Counsel members joining us today include Don Tyson, Sam Walton, J.B. Hunt, Alice Walton, and Jim Blair.

In fact, all levels of Government and the private sector will be represented at the witness table today. Joining us from Washington are Dr. Thomas Larson, Administrator of the Federal Highway Administration, and Leonard Griggs, Associate Administrator for Airports with the FAA; and from Dallas, Brigadier General Stanley Genega, the Corps of Engineers' Southwest Division Engineer.

We know, of course, that this committee has not come to Arkansas to solve all of our state's infrastructure problems. These problems are now primarily under the authority of state agencies, although we have major federal programs that provide states with assistance to help in all of these areas. This hearing is really part of an effort to develop an overall national strategy on how to best improve and maintain our nation's infrastructure.

However, I know that locally, interest has been expressed in pursuing the feasibility of a regional airport, and certainly this might be the ideal place for the Federal Government to be closely involved in planning and financing.

In addition, the committee will be taking a closer look at surface transportation in northwest Arkansas during the hearing that we have scheduled, as I've mentioned, for early next month in Fort Smith.

That hearing will allow the additional opportunity to discuss a number of issues that I know will be brought up here today, including the Highway 71 corridor, which runs from I-40 north to the Arkansas-Missouri state line, and the Highway 412 corridor, the east-west four lane route that crosses the northern part of Arkansas.

I want to especially congratulate the Arkansas Highway Department on the great progress they have made and the amount of funding that they have been able to devote to Highway 71, given the additional funds that have been made available to Arkansas by the Federal Government in recent years.

I also want to commend the Department for using all of their obligational authority in 1990, which allows the state to receive an additional $7 million in redistributed obligational authority just last month, in August.

Next month's Fort Smith hearing will be another in the series of such hearings being conducted by our Surface Transportation Subcommittee in preparation for drafting the next major highway bill, under the leadership of Congressman Mineta and Bud Shuster.

I might add that in that hearing, as well as today's hearing, we will be looking at new and innovative ways to finance our infrastructure needs. One option would be to allow the use of tolls on new federal aid highways. Allowing such tolls on new highways may be one of the ways to meet the needs for new highway construction, especially given the current budgetary constraints. So, I see a great deal of merit in this, and I am actively pursuing the possibility of having this concept included in next year's highway reauthorization bill. Certainly I will be discussing it with Congressman Mineta and Congressman Shuster.

Again, I want to thank you, Mr. Chairman, for convening this hearing today, and I look forward to hearing the testimony of our distinguished witnesses.

The CHAIRMAN. Thank you, John Paul. And Bob, Congressman Bob Roe of New Jersey, the Chairman of the Science, Space and Technology Committee.

Mr. ROE. Thank you, Mr. Chairman.

The thought occurs to me, Mr. Chairman—First of all, I'm paying my high regards to you for having this outstanding hearing. We have more people participating, Members of Congress, than we had when we had the hearing in Washington. I wanted you to know that.

In order to lighten up the severity of the bulk processes that are going on today and having a chance to listen to the witnesses and not to the Members of Congress—however, when you ask anybody to comment that's at this table, they're all going to comment—and I had to find out something about Northwest Arkansas — and I'm going to close by talking a little bit about John Paul—and I wanted to know something, and I didn't really have—I thought it was a little—but I asked it anyway. So, I asked Don Tyson, I said, "Tell me, Don, can you answer something for me," and he looked a little bit, you know askance, and whatever, and he said, "What would you like to know?" I said, "Well, how many chickens are consumed in the United States in a day, and I'll bet that you in Arkansas know," and he tells me that there's 15 million that are consumed in a day, and there's 105 million—Don, if I'm correct—in a week in the Nation.

The third observation I want to make is I'm looking over Arkansas and I want you to know that Northwestern Arkansas could be an absolute duplicate for the Northwestern section of New Jersey. One other point that I want to make is that—and being up front, I have an admonition and a confession I want to make this morning—and I know that we're here to talk about infrastructure and water and bridges and highways and the whole bit—but you know, this year they redistricted, every 10 years they redistrict the nation based upon the population. We in New Jersey are going to lose one seat—and I've got to be up front with you, I came down looking over Arkansas, and you may have room for me, and I have to be a little bit—but not in Northwest Arkansas, Norman said, because we don't want to run against John Paul.

I'll close on two quick points. One, John Paul is one of our really outstanding leaders in the United States, and I think that gives rise to the point of so many Members being here—and let me close on this point to put it all into a quite clear perspective—you know, one of the correspondents, if I may, to the press that are here, made the point when we landed, and Chairman Anderson and John Paul made their presentation, and he asked a very good question—he said, "My god, here we have the situation taking place in Iraq and the major buildup that's taking place in the Mid East area, and you've got a budget situation, how are you going to pay for all of this situation . . ."—recall that yesterday—". . . vis a vis the point of you building infrastructure."

Infrastructure is not a good word. You know, it's kind of like—it's a tough one to deal with—but let me give you just one analogy quickly.

When they built the George Washington bridge going across the Hudson River, and it was, I guess, dedicated by Mayor La Guardia—I was only three years old at that point, I want you to know that it cost $63 million. When they, 15 or 18 years later, put the double decking on that bridge, the double decking that they put on the bridge cost $143 million. The entire George Washington bridge, when it was constructed, cost $200 million. If you were to attempt to duplicate the George Washington bridge today, assuming you could get an Environmental Impact Statement, it would cost at least 4 or $5 billion.

So, when we talk about infrastructure, put the word out of your mind and think about the great wealth of America—the great wealth of America lies in its infrastructure, built by different generations.

If you were to talk to the Soviets, Mr. Hunt, one of the major problems is they haven't got a transportation system, they cannot distribute their goods.

If you were to talk about, Mr. Walton, about creating an entrepreneurship, and you were to talk about the work that's been created, you couldn't do that yet in other countries unless we teach them. That's part of infrastructure from my point of view.

If you talked to Mr. Tyson about creating food for other marketplaces of this country or the world, that also is infrastructure.

But if you can't get the goods to market, and you can't distribute them because you don't have the roads, the bridges, and the highways and things we need, and the water supply to drink, and the clean water that we need to survive as human beings, that's what infrastructure is about.

So, we are really basically talking about the wealth of the country, and that's what we should start to talk about and not what it's going to cost us, what we're willing to invest, to keep the growth of the country going the way it should go.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you, Bob.

Congressman Jim Inhofe.

Mr. INHOFE. Thank you, Mr. Chairman. The Chairman and Mr. Hammerschmidt have been kind enough to let me make an opening remark along the personal line.

This is kind of like a homecoming to me. First of all, I'm honored to be a cousin by marriage to the Walton's. We, Mr. Chairman, in our part of the country call them "shirt-tail cousins," so it's nice to be back with them.

Secondly, three of my four children graduated from the University of Arkansas, and I don't think there's anyone at this table on the Public Works and Transportation Committee who has a stronger commitment to the completion of what we used to call Highway 33, than I do, after having had three children go through the University of Arkansas.

I've been waiting to tell this one story, since Mr. Blair is here. Mr. Blair, for the benefit of the panel up here, is Chairman of the Board of Trustees for the University of Arkansas.

During the years that my children were in Arkansas, I was Mayor of the City of Tulsa. Two of my daughters were cheerleaders for the Hogs. Either the opening game run, or one of the opening games each year, is the University of Tulsa versus the University of Arkansas at Fayetteville, and the University used to always put my two daughters in front of the Tulsa section to lead the Hog cheers when I was Mayor of Tulsa.

So, Mr. Blair, I've been waiting for a long time to tell you that I appreciated the exposure more than the discretion.

It's nice to be back home.

The CHAIRMAN. Are there any other Members who wish to make opening statements?

Mr. PACKARD. Mr. Chairman, I would just ask that Members' prepared statements, be entered in the record, and that we allow the witnesses to go ahead.

The CHAIRMAN. No objection?

[No response]

The CHAIRMAN. So ordered.

[Statements of Representatives Packard and Rahall follow:]

STATEMENT OF
THE HONORABLE RONALD C. PACKARD
REPRESENTING THE 43RD DISTRICT OF CALIFORNIA
BEFORE THE HOUSE COMMITTEE ON
PUBLIC WORKS AND TRANSPORTATION
SEPTEMBER 8, 1990
SPRINGDALE, ARKANSAS

THANK YOU MR. CHAIRMAN:

I AM INDEED PLEASED TO JOIN YOU AND MY OTHER COLLEAGUES HERE IN ARKANSAS 3RD CONGRESSIONAL DISTRICT FOR THIS MOST IMPORTANT HEARING. ARKANSAS 3RD CONGRESSIONAL DISTRICT IS REPRESENTED BY ONE OF THE MOST RESPECTED MEMBERS OF CONGRESS AND A GOOD FRIEND OF MINE, JOHN PAUL HAMMERSCHMIDT.

AS THE RANKING REPUBLICAN MEMBER OF THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION, JOHN PAUL HAS BEEN A LEADER IN CONGRESS IN THE AREA OF INFRASTRUCTURE AND ECONOMIC DEVELOPMENT. HE HAS WORKED DILIGENTLY WITH ME AND OTHER MEMBERS OF CONGRESS TO BUILD MUCH NEEDED INFRASTRUCTURE PROJECTS IN AREAS THAT ARE DEFICIENT. I NEED NOT INFORM ANYONE IN THIS FORUM THAT JOHN PAUL HAMMERSCHMIDT IS A TIRELESS WORKER TO ENSURE THAT THE NEEDS OF NORTHWEST ARKANSAS ARE IDENTIFIED AND MET.

THE HEARING TODAY IS ONE IN A SERIES OF HEARINGS THROUGHOUT THE NATION IN AN EFFORT TO BRING PROMINENCE TO THE ISSUE OF INFRASTRUCTURE. ALL TOO OFTEN INFRASTRUCTURE IS NOT DISCUSSED

UNTIL A BRIDGE FALLS DOWN OR A HIGHWAY IS CLOSED BECAUSE IT IS SUBSTANDARD. THIS SERIES OF HEARINGS IS HELPING TO BRING THE IMPORTANCE OF INFRASTRUCTURE INTO A PRIMARY FOCUS.

MAKE NO MISTAKE, ADEQUATE INFRASTRUCTURE AND INTERNATIONAL COMPETITIVENESS GO HAND IN HAND. THE UNITED STATES HAS BECOME LESS COMPETITIVE BECAUSE OUR CORE INFRASTRUCTURE NEEDS HAVE GONE UNMET. HIGHWAYS ARE CONGESTED; AIRPORTS ARE DELAYED; IN AREAS SUCH AS MINE IN SOUTHERN CALIFORNIA WATER SUPPLY IS BECOMING SERIOUSLY DEFICIENT. THESE PROBLEMS ARE MORE THAN JUST INCONVENIENCES, THEY DIRECTLY IMPACT OUR NATIONAL ECONOMY AND IN TURN OUR INTERNATIONAL COMPETITIVENESS. WE AS A NATION MUST MAKE AN EFFORT TO REBUILD AMERICA'S INFRASTRUCTURE OR WE WILL FALL FURTHER BEHIND IN THE EVER COMPETITIVE GLOBAL MARKETPLACE.

I COMMEND CHAIRMAN ANDERSON AND CONGRESSMAN HAMMERSCHMIDT FOR SCHEDULING THIS HEARING AND THE SERIES OF HEARINGS ON INFRASTRUCTURE NEEDS THAT WILL TAKE THE COMMITTEE ACROSS THE NATION. I WOULD ALSO LIKE TO THANK CONGRESSMAN HAMMERSCHMIDT FOR HIS HOSPITALITY AS WELL AS THANK EVERYONE WHO HAS WORKED SO HARD TO MAKE OUR STAY HERE ENJOYABLE.

OPENING STATEMENT OF HON. NICK J. RAHALL II (D-WV)

Mr. Chairman, I would like to take a moment to express my thanks to you and our distinguished universally respected ranking minority member John Paul Hammerschmidt for inviting me to participate in this hearing on infrastructure needs. I am more than pleased to be able to take testimony on the infrastructure needs of rural Arkansas, so that I can compare them with the rural needs expresed by my fellow West Virginians. I expect to feel right at home with the distinguished witnesses on our panel today.

If anyone needs to have a clearer understanding of why our committee continues to hold its scheduled series of hearings across the country on infrastructure needs, let me cite some statistics that should enlighten you:

There are nearly 3.9 million miles of roadway in the United States today. Eighty (80) percent is surfaced.

The replacement value of those millions of miles of road is approximately $480 billion dollars.

Each year, the U.S. road network handles more than 1.8 trillion vehicle miles of travel. Eighty (80) percent is done on the Federal-aid highway system, which comprises less than 22 percent of the Nation's road mileage.

In 1985, the Nation's highways transported 610 billion ton-miles, or 40 percent of total freight tonnage, reflecting a 70 percent increase over a 20 year period.

In 1985, total expenditures by the Federal Government, States and local governments on the Nation's highways and bridges was $45.1 billion.

More than 220,000 of our Nation's bridges, out of a total 575,000, are either structurally deficient or functionally obsolete.

The added cost of driving on bad roads is approximately $16.2 billion, or $99.60 per driver, and we waste approximately 1.38 billion gallons of gasoline in traffic congestion on limited access highways per year. By the year 2005, this gasoline waste is expected to rise to 7.32 billion gallons.

Despite what the administration has proposed to spend on infrastructure needs, which amounts to more in reduced funding than increases, we cannot possibly meet our needs without increasing our financial commitment.

As a representative from West Virginia, I can tell you that the States cannot deal with spending more of its resources on highways and bridges, or other infrastructure needs. They need, and they deeply appreciate, Federal funding for their highways.

It is not only a crisis in West Virginia, it is a national disgrace, and it must become a national priority.

I believe the Chairman's field hearings throughout the country in the past weeks will bring our infrastructure needs and their crisis proportions, quickly and forcefully to the forefront of the Nation and its people, and hopefully to the immediate attention of President Bush and the Congress as a whole.

Our threat is no longer communism—it is competition. Let's work together to rebuild America.

The CHAIRMAN. Because so many people have been willing to participate in this hearing, and because of our time constraints, I'm going to ask each witness to summarize his statement orally in hopefully two or three minutes.

Each witness' full statement will be printed in its entirety in the record of the hearing.

Our first panel of witnesses today will be giving us an overview of infrastructure needs and they are Mr. Jim Blair, the legal counsel for Tyson Foods, Incorporated, Mr. Don Tyson, the Chairman and Chief Executive Officer of Tyson Foods, Incorporated, Mr. J.B. Hunt, the Chairman of J.B. Hunt Transport, Incorporated, Mr. Sam Walton, the Chairman of Wal-Mart Stores, Incorporated, and Alice Walton, the Chairman and President of the Llama Company.

I want to welcome all of you, and let's begin with Mr. Blair.

TESTIMONY OF JAMES B. BLAIR, CHAIRMAN, UNIVERSITY OF ARKANSAS BOARD OF TRUSTEES, GENERAL COUNSEL OF TYSON FOODS, INC., MEMBER OF THE NORTHWEST ARKANSAS COUNCIL

Mr. BLAIR. Thank you very much, Mr. Chairman. We are awed by the attention and by having all of the distinguished Members of this committee here. We do know it's in part in tribute to our own Congressman John Paul Hammerschmidt.

You know, when he ran for Congress in 1966, he was running as a favor to Winthrop Rockefeller to help strengthen the ticket of the Republican party. He didn't have any idea he could win, he didn't intend to win. He was the most surprised person in the state when he found he had to move to Washington. But he has been our gain ever since, and he was a businessman and has a businessman's point of view in terms of what you are telling us about productivity, which is one of the bywords of this Northwest Arkansas Council.

There has been a statement submitted, Mr. Chairman, over the aegis of the Arkansas Council, and I sponsor that statement and ask that it be submitted in the record.

I would tell you that in 1950, the population of Northwest Arkansas, Washington and Benton County, was not growing as fast as the rest of the United States, and there is a chart over here which shows the acceleration of the population growth of Northwest Arkansas as against the National population growth.

In about 1960, it started increasing dramatically, and it continues to increase at an increasing rate. Congressman Roe, you are the tackee up there. I believe that's what they call acceleration.

But we are now something over 200,000 and in the very foreseeable future, we will be something over 300,000 people, one of the largest areas that doesn't have any direct link to the interstate highway system.

The people on this panel are probably too modest to tell their own accomplishments, but the people at this table have created since 1960, over 350,000 jobs. They employ over 350,000 people today. That's almost a Congressional district. They run thousands and thousands of trucks over the roads.

Mr. Walton here, if the statistics I'm reading are correct, will, at the end of this year, his company will be the largest retailer in the United States.

Mr. Hunt here runs 4,400 trucks. He is the largest trucking company in the United States, and also the most fuel efficient.

Mr. Tyson is the world's largest chicken farmer. In 1950, when Sam was opening his first five and dime store, Mr. Tyson was opening his first poultry processing plant. He now has 41 processing plants and employs 44,000 people, kills 25 to 26,000,000 chickens a week.

Alice Walton, who is the Chairman of the Northwest Arkansas Council, is, I believe, the largest minority investment banking company in the United States, but I'd have to check those figures.

These people, however, are committed to productivity, and they haven't ever asked the Government for any particular help. They have been an entrepreneurship.

But what is happening is that the result of all this and a lot of other factors, are moving the population of the United States to where this is about to become the population center of the United States.

We have another chart here that shows—and the two lines are depending on whether the south grows a little faster or the west grows a little faster—but the population center of the United States is just slightly southwest of St. Louis and moving this way, and any projection you can make, you are in what is very shortly going to be the population center of the United States, and I think that has significance for some of the things that we would like to ask you to do.

In regard to the highway system, the highways of what I believe is now going to be called of national significance, there is a missing link that Congressman Hammerschmidt referred to—if we could have the next chart.

When the interstate highway system was constructed in the 1950's, a center corridor north and south down the center of the United States was just left out.

We, of course, strongly support the creation of a highway of national significance that would move from Kansas City to Shreveport, and really would allow traffic to move from the Great Lakes to the Gulf. We don't want anybody to think that because we are focused on Northwest Arkansas, that we are not concerned about Texarkana and all the rest of Arkansas having access to this, because we are. That will be addressed in greater detail.

If we could see the next chart, please.

The other thing that we are going to be concerned with, we are going to ask for a special demonstration project which is to put in a 20 mile stretch of four lane highway that will connect up Northwest Arkansas to the Cherokee Turnpike. This is the highway that Congressman Inhofe's children used to drive over, and it is a terribly dangerous highway, and this chart shows the degree of traffic, injuries, and fatalities, in reference to how the highway is structured, and you can see the peaks of that chart are above the average for rural highways.

It is many many times the average, and what is going to happen when the Cherokee Turnpike is finished, is all that traffic is going to funnel in to this two lane rural stretch that already has a higher accident rate than most rural highways by far, and going to make it much more dangerous.

So, it is not only productivity, but it is saving lives and it is in terms of safety.

The other thing that we are going to ask for, and the panel members will cover in greater detail, is an idea whose idea, I think, is a time that's come.

You have pointed out that there has not been an airport built in the United States since 1974. We think we have an area where you could build what is called, or would be called a reliever airport. It would be a major cargo distribution airport. Because it is in the population center of the United States, because it is very close to the geographic center of the United States, air cargo that now breaks over big population centers causing enormous congestion and enormous expense, could break over this relief airport and be distributed all over the United States.

The trucking distribution and all of that is in place. It would involve participation of the private sector. Federal Express has expressed an interest in being involved, where they would do their maintenance here. There are other private companies that would do this.

This would create a highway-airport link, which would even include a highway linkup to the Kerr-McClellan Navigation System, so it would also include a water link totally intermodal.

We think all of these things would do something for us, which I would illustrate by the metaphor that we are like a potted plant which has started from a seed, germinated, grown as fast as we could, we have been as productive as we can, but we are about to become root bound because no attention has been given to the infrastructure, except incrementally in many many years.

All of these people are doing business essentially over the same transportation system that existed when they started. It is incrementally improved, but if we are going to continue the growth that will add to the productivity of the United States—these people are Mr. Tyson that exports hundreds of millions of dollars a year which helps our trade deficit, Mr. Walton with his "Buy American" program has revitalized many small American industries, because of his enormous ability to distribute goods—all of this we think will lead to a healthier economy.

So, we would ask that legislation be enacted that allows the Highway Trust Fund to be spent down. That some of this money be used for what it was intended to be used.

Arkansas pays in a hundred cents and gets back eighty-two cents. Even though we are a poor rural state, we are a net donor, and we would like to see, of course, that everybody gets back approximately what they spend in, and we would also think because fuel, diesel fuel taxes are so high, that there ought to be a formula allocation that takes, in view of where this diesel fuel is spent and used, that some of it flows back.

We know that the committee is giving all of this serious attention. We know that many of you are already outspoken proponents of that legislation. We would pledge our support.

We thank you very much for coming here, and God bless all of you.

[The prepared statement of Mr. Blair appears on p. 1643.]

The CHAIRMAN. Our next witness is Mr. Don Tyson, the Chairman of Tyson Foods, and Don, you were referred to awhile ago as the biggest chicken man. You don't look that big.

Mr. TYSON. Well, thank you, Mr. Chairman, we try.

TESTIMONY OF DON TYSON, CHAIRMAN AND CHIEF EXECUTIVE OFFICER, TYSON FOODS, INC.

Mr. TYSON. Mr. Chairman, Congressman Hammerschmidt and Members.

U.S. Highway 412 in Northwest Arkansas to I–44 in Tulsa has a missing link.

The development of a special demonstration project would improve highway safety, relieve congested traffic, improve rural access, and help link up the McClellan-Kerr Arkansas River Navigation System.

A partnership of the Federal Government, Oklahoma, Arkansas, and the private sector, working together, could correct this problem for the citizens of our area.

Thank you very much.

[The prepared statement of Mr. Tyson appears on p. 1765.]

The **CHAIRMAN**. Thank you, Don.

Mr. J.B. Hunt, Chairman of Hunt Transport.

TESTIMONY OF J.B. HUNT, CHAIRMAN, HUNT TRANSPORT, INC.

Mr. **HUNT**. Thank you, Mr. Chairman and Members of Congress. Don has made his statement pretty short. I have a bit more to say than that, but when I came here about 20 years ago to go in the trucking business, I had five old trucks and seven worn out trailers, and we started trucking, and everybody said, "Why would you come to Northwest Arkansas?"

Well, there's something that's different than anywhere else, and I can feel it, and I know it is, and it's a great place to live, and it's second to none. So, I have enjoyed living here, and now we've got up to 4,200 trucks, almost 10,000 trailers. We burn about 54 trailer loads of diesel fuel a day that costs about $500,000. Our payroll is up to almost $1 million a day, which is about 8,000 employees.

The thing that bothers me here more than anything else is I was a truck driver, and the roads haven't changed much here in 30 years, and we have about 17,000 trucks and trailers coming in here a year.

Mr. Walton has about 500 trucks per day come and go here, and Mr. Tyson has more than likely 260 or 300 a day, and I just can't figure out why that we can't do something with this major problem.

I was asked to come to Texarkana last year to meet with a group of Highway Department people—Governors and everything—and I told my wife, I said, "Well, if I'm going to talk about Highway 71, I need to drive down there." So, we get in the car, drive down to Texarkana, and on the way down there, I had this terrible feeling. It was the same feeling I had in World War II, when I was crawling under barbed wire fences with machine guns over my head, and when I got out from under that machine gun, I would always shake myself and say, "Thank God, I made it."

When I got to Texarkana in this new Cadillac, when I hit the freeway, I had that same feeling, "Thank God, I made it."

That is the crookedest road, heavily traveled—it's unbelievable. I'll tell you, it is terrible.

I know Mr. Walton and Mr. Tyson are not in the habit of begging, and I'm not, but I'll tell you what—I would beg anyone to fix that road.

So, I thank you Congressmen for coming down here, and I thank John Paul. If we name the road Hammerschmidt, I think it should be Mr. Hammerschmidt.

Thank you and God bless you.

The **Chairman**. Thank you, J.B.

Our next witness, Mr. Sam Walton, Chairman of Wal-Mart Stores.

TESTIMONY OF SAM M. WALTON, CHAIRMAN OF THE BOARD, WAL-MART STORES, INC.

Mr. **Walton**. May I stand a moment? I have never made a formal speech in my life, I have never made a formal presentation in my life, and I have never made a presentation to any congressional group before in my life, so I, too, so much appreciate your presence and your being here.

John Paul was a budding entrepreneur in Boone County—J.B. and Don, you remember—He was running the largest lumber yard—it wasn't called a Home Center—of anybody in Northwest Arkansas.

And Jim, you're so right, he was shocked more than anyone else when he got elected. I didn't think he would beat Jim Trimbell, but he did, and what a blessing he has been to Arkansas ever since.

So, I'm glad to be here. I appreciate so much the support of our friends from Tulsa, and all over this Northwest Arkansas area. I especially appreciate the great work that has been done by Evaldie Lindsey, Alice, and the Northwest Arkansas Council. That distinguished group of folks—Jim, I guess you're on that committee—that has done so much to bring this here.

Do you mind if I get my uniform on? I'm really not feeling good, Mr. Chairman, until I——

[Applause.]

Mr. **Walton** [continuing]. If you can't hear me, raise your hand and we'll do something about it.

We have got an unusual area here. It's full of other entrepreneurs, small businesses that will be, and I think, as successful as Don and J.B., and possibly Wal-Mart in time. This area—I wish we had time to introduce them—and I guess you've got a feel for it, the last 20 hours that you've been here, our guests, but it is most unusual, and I think that given 10 years, in the year 2000, if we do our work right, we will give many of those growing companies an opportunity to do what we have been privileged to enjoy. I think it's a unique area.

I know our ambitions, our objectives, are most ambitious. I know that the idea of a large regional airport in Northwest Arkansas that would be possibly a reliever airport, Jim, as you suggested, and possibly be multipurpose used by possibly some air cargo companies, or others, seems like it may not be practical at this point.

But the more I look at this material that has been assembled, the more I think about where our company has been and where we're going, John Paul, the more I really believe that, like in all of our businesses and I think the businesses that are represented here and in Oklahoma, we can make this thing pay.

I think it can become cost effective, and I think that's the way these businesses have grown. I know it has been with us. We have to make a profit, or we don't put in another store, and we've had to do that from the very beginning.

I really believe, Jim, that should we be able to get this road extended from Siloam Springs over to Springdale, should we be able to continue the work that you referred, J.B., on 71 south as well as north, and then if we can lay this airport in the middle of this area and serve the needs, I think that we will be able to do some of the things that we want to do.

I had never thought about—You know, we are a partnership in Wal-Mart. We talk about our partners being our associates, and they are, and we talk about our stockholders being partners, and we talk about our customers being partners, and our vendors, but the largest partner, Mr. Chairman—and I've never really thought about it this way—that what we have in our company, is the United States Government of America—and I really believe that we can achieve our goals as a company.

We think we need to double our size and can double our size in five years time. We're going to be $32 billion plus this year, Bill—the informality of calling that fine Congressman from Missouri, Bill—but we think we will do $32 billion plus. We think that in five years, we will be doing $64 billion. This year, as a partner—and I'm proud and pleased that we pay the income taxes that we do, the corporate taxes, and I'm glad even to pay the taxes on the diesel fuel that we run, as well as the gasoline that we use wherever—but I expect this year—and I hope you'll forgive my—It's not—I don't ordinarily talk about these kind of numbers—but this year, we will corporately pay between $800 and $900 million in taxes just from our Wal-Mart Company alone in Bentonville, Arkansas. Next year, if our profits are maintained and we're on track, we will pay in excess of $1 billion in taxes to the U.S. Treasury, and we're glad to do it, and glad to be able to.

But our plans are rather real ambitious. In the year 2,000, we think we'll be four times the size we are today, and I think we actually can achieve it, but in order to do it, we're going to have to have this airport that we're talking about. We're going to have to have the road system that will support us, and we'll have to let people move in and out of here.

Don, you know that we're buying, and you know we're buying all over the world, but we're buying first as much as we can from the United States of America.

You know, as a philosophy, Mr. Chairman, we have changed from going to New York to buy our goods, going to Tokyo to buy our goods, to Taiwan or Hong Kong, we're saying to folks today, "If you want to do business with us, we'd rather have you to come on into our area, come on our own turf, bring your samples, bring your projects, and we'll sit down and talk to you about a plan and we'll become your partners," but they need to come to Bentonville, Arkansas.

Well, it's tough to get to Bentonville, Arkansas.

We just feel like if we have the opportunity and we have the infra—I can't even pronounce the word, Congressman Roe—but we've got that thing that we need, the base, we'll have—we'll be able to double our sales and double our payments to the United States Government. We think next year we'll be paying over $1 billion in corporate income tax and glad to do it. We think that in the year 2000—I won't even talk about it because it's a wild number—

we think in the year 2000, we'll be doing over $100 billion in sales, but we've got to bring in a lot of people here to do it, we've got to be consistent in what we do, and we just need—but we think we can make it pay.

We think we have a program that will pay for this airport and will pay for these roads, and an investment made now to help us out, will be well spent and well considered for the United States of America.

And we really appreciate your time and your attention and any help that you can give us, and then we stand ready to help any of you in any way that we can. Thank you very much.

[The prepared statement of Mr. Walton appears on p. 1834.]

The CHAIRMAN. Well, thank you, Sam, and we thank you especially for paying those taxes.

Our next witness is Ms. Alice Walton, the Chairman and President of the Llama Company.

TESTIMONY OF ALICE L. WALTON, CHAIRPERSON AND PRESIDENT, LLAMA CO.

Ms. WALTON. Thank you, Chairman Anderson, and our dear friend and distinguished Congressman Hammerschmidt, and other Members who have taken the time and made the effort to attend this meeting and get to know a little more about our part of the world.

There is only one person in my life who I have never envied, and that's that person that follows my daddy, but I guess we all hit that at some point or another, so I'm just going to take it from there.

You know, we used to always go on family vacations and mom and dad would throw the four kids in a station wagon and we'd try to camp out in a different part of the country every year, and it was a great experience. We met other little kids from all over the United States—went east, went west, went south, went north—and they'd say, "Well, where are you from?" and we'd say, "Well, we're from Northwest Arkansas," and they'd say, "Well, where is that?" And we'd say, "Well, it's real pretty and has real nice people, and mountains, and water, but you really can't get there from here."

I'm not going to admit whether that was 20 or 30 years ago, and some things have improved, but the basic statement unfortunately does remain the same.

We ask for your support and we pledge you our support in a public-private partnership, to try to help relieve this situation, and to continue our efforts to support the economy of the Midwest, and this country, as a whole.

Northwest Arkansas, the Third Congressional District of Arkansas, is a multi-billion dollar economic hub of production and distribution at the population center trend line of the United States, and has experienced amazing population and economic growth over the last 30 years.

Northwest Arkansas is one of the largest centers of population in America, which does not have a four lane link to the interstate system, or an adequate airport facility to meet the region's needs.

In spite of those infrastructure deficiencies, two counties of the region, Washington and Benton, have seen their population grow 129 percent since 1960.

According to the preliminary 1990 census figures, these two counties of Northwest Arkansas had a population growth over the past 10 years which accounted for 64 percent of Arkansas' total population increase from the period of from 1980 to 1990, a rate of growth which is more than eight times the state average.

The economic well-being of Northwest Arkansas mirrors the growth in population as evidenced by almost a 16 times increase in property tax assessments during the last 25 years, and almost a 2,000 percent increase in bank deposits during this same period.

Looking forward, the future looks equally bright. However, without an improved highway system and an adequate airport, the future growth and economic prosperity of Northwest Arkansas and the whole Midwestern region, could well be jeopardized.

We need to build a mid-America reliever airport similar to the Alliance Airport near Dallas, in Northwest Arkansas. Such a facility would not only provide us with a safe dependable link to the Nation's aviation system, but it would be an economical method of helping solve the overcrowding and congestion of air space, airports, and ground access facilities at the seven major mid-America hub airports.

The aviation industry must recognize, based on pure economics Government spending restraints and noise pollution problems, at the major airports, and the major destination cities, that the only timely, efficient, economic solution, to our national air traffic problems, is the separation of destination and rural hub transfer facilities.

We propose that the public-private partnership joint effort be immediately developed as a mid-America reliever airport and supported by private interest air cargo and maintenance operations.

We also desperately need the direct four lane access to the interstate highway system, both along U.S. 412 and the Interstate 44 at Tulsa, and U.S. 71 to I-40 on the south, and the Interstate 44 on the north.

We believe that the needs of Northwest Arkansas for an improved transportation system is of national scope and meets the funding and programmatic criteria for development.

We would appreciate your favorable consideration of our request, and we thank you for your time.

[The prepared statement of Ms. Walton appears on p. 1832.]

The CHAIRMAN. Thank you, Alice.

I want to thank you, panel. You have already clearly presented a strong case for private businesses' need for improved highways and airport facilities in northwest Arkansas, and the positive effect it would have on your ability to compete in the marketplace.

Now, are there currently any plans in the works at the state or county level to meet some of these needs, and what specifically do you see as the federal, the specific federal role?

I'm asking that question—Mr. Blair, okay. John Paul suggested directing that to you, although it was kind of to the whole panel, and also we're going to have to keep our questions and our answers fairly brief, because I'm told there's a couple of them that are already late—a couple of witnesses that have to be at some other things.

Jim?

Mr. **Blair**. Mr. Chairman, the answer is, yes, I believe the state is very supportive of these proposals. An amended Order has been issued by the State Highway Department approving the project we refer to as the Special Demonstration Project, which is the link to the Cherokee Turnpike.

The arrangements have been made with the State Highway Department approving the flow of a substantially greater than normal amount of the federal funds and state funds into Highway 71, and there are pieces of it under construction, and certainly Congressman Hammerschmidt has been very involved in all of this.

It has such an attention, Mr. Chairman, that a local television station in Fort Smith, every night at the end of their news program, every night gives a status report on the construction of Highway 71. I don't know whether that goes on anywhere else in the United States or not.

But the local community, the business community, is willing to consider any alternate means of financing. The Governor has been here and has put his personal stamp of approval on that inner link of the Cherokee Turnpike, and has said that he will cooperate in any kind of a program that can help to establish it.

We do need substantial federal help. By making this a special demonstration project, as I understand the way the system works, there could be quick direct funding and if you haven't had an opportunity—and I know you had this hearing in Tulsa—to see what remarkable things have been done with the Cherokee Turnpike construction—they put a half a dozen contractors on different segments and did it all at once and they're going to have it finished ahead of schedule sometime in 1991.

So, since that's going to funnel all of that traffic into this dangerous highway, we're having to be in a hurry too, so I believe the answer is, we can rally every other sector of the society and the government in support of these projects.

Mr. **Hammerschmidt**. Mr. Chairman, let me just comment.

Jim, thank you for your response.

You know, we're going to have a Surface Transportation panel here, and we're going to have the Chairman of the Highway Commission and Bobby Hopper, our local Highway Commissioner that can speak more comprehensively to the Chairman's question, as you know.

I know we are really pressed for time here and we have a distinguished witness who came from Washington that is trying to get to a very important event, and we promised that we'd get him out after awhile, but let me just say, we've never had a more distinguished panel before this committee, in Washington, or anywhere else in the field hearings, than we have here this morning, and we very very much appreciate your testimony, all of you. You did a great job and we appreciate it.

Thank you. Thank you, gentlemen.

The **Chairman**. Any other questions of this panel?

Mr. **Laughlin**. Mr. Chairman, I would just have an observation—John Paul and I have talked about this, my district is very similar to John Paul's district, but I didn't realize how much until I got here last night. My staff scheduled me for yesterday morning, several months in advance of yesterday, to visit Tyson Foods in Seguin, Texas. While I was there, Jim, you might be interested to know that when you were talking about foreign trade, they were loading these sacks, half in English and half in Russian, which I can't read, Don—I assume it's the same thing the English is.

But these bags being loaded at Tyson Foods in Sequin, Texas, to go to Russia, helping with the trade deficit, and the very problems you were talking about have been brought home very well, because rural America is dependent. J.B. Hunt's trucks run up and down the highways in my district, and Sam Walton has got his huge distribution center about 10 miles from Sequin over in Larone County, but it's over there in Hays County outside my district, but it points out those locations are there because they are near an interstate highway.

So, we appreciate your testimony today, and thanks for making all of us feel at home here.

Thank you, Mr. Chairman.

Mr. **Mineta**. Mr. Chairman, if I might just very quickly.

Mr. Blair, roughly what is the cost estimate of that 20 mile section?

Mr. **Blair**. 40 to $50 million.

Mr. **Mineta**. And as I understand it, the U.S. 412 that you're talking about, does that parallel Arkansas 68 and——

Mr. **Blair**. My understanding is it will supersede Arkansas 68. Arkansas 68 will become 412.

Mr. **Mineta**. And so what we know is that Oklahoma 33 is the Cherokee Turnpike on the Oklahoma side?

Mr. **Blair**. Essentially, it, I believe, and Congressman Inhofe could correct me, is essentially, yes, it will replace it.

Mr. **Mineta**. And that's a state funded toll project?

Mr. **Blair**. I believe that's correct.

Mr. **Mineta**. And you anticipate that this portion of U.S. 412 would also be a toll project?

Mr. **Blair**. That is one way it could be done, and we don't have any legislation in our state that authorizes it to be done that way.

Mr. **Mineta**. Well, that was the next question I was going to ask, if you've made any approach to the Arkansas Department of Transportation along that line.

Mr. **Blair**. We have in the sense we have said it has to be done quickly and we will certainly support any kind of alternate financing.

Mr. **Mineta**. With respect to the airport, Congressman Packard and I are putting a Bill together as it relates to regional planning of regional airports. And it seems to me that maybe this is the kind of thing we could be looking at there, as well as some of the road system that are being suggested in your testimony, under a new program that's anticipated in the new legislation that I'm putting together right now called Highways of National Significance.

So, I believe this is the kind of thing that has the local and state economic development benefits that we're looking at—the kind of partnership you're talking about here.

Again, thank you very, very much.

Mr. HAMMERSCHMIDT. Will the gentleman yield?

Mr. MINETA. Absolutely.

Mr. HAMMERSCHMIDT. Mr. Chairman, Arkansas put together this 412 corridor by taking parts and pieces of the most logical east-west route, so we would have a corridor to work with, so it's parts of several different highways, 68 being the major highway.

It may be, and I mentioned that in my opening statement, that we may want to consider taking money out of the Highway Trust Fund to make sure that a toll road will work. In other words, subsidize it to the degree that it won't work, and let it continue that way.

Oklahoma is way ahead of us, because they started that Will Rogers Turnpike right after World War II, and they've had lucrative toll roads and they have had revenues from that flowing from it.

But it is an area of consideration I know we will want to discuss before we go out.

Mr. MINETA. Mr. Chairman, if I might, since we have a user of the highway system and one of the largest trucking firms represented right here at this panel, I'm wondering if I could ask a question about LCV's, the Longer Combination Vehicles.

There is a push right now to the possibility of raising our 80,000 pound limit to something higher, possibly 120,000 pounds, possibly going to triple 28 trucks or double 48's, and I'm wondering if you have any comments on whether or not we at the congressional level ought to be doing anything to push for, or to include in our next surface transportation, highway mass transit type of legislation, any consideration of those increased limits, given the talk about productivity. And we have to weigh that against safety, as well.

Any thought on that? Mr. Tyson.

Mr. TYSON. That's J.B.

Mr. MINETA. J.B. Hunt, Mr. Walton?

Mr. HUNT. I wouldn't recommend raising the weight, not in our business. An 80,000 pound gross is just about all that I—I would say though, let us pull two trailers, because that gives you more traction, more brakes, and do that on a restricted basis.

I'm on that committee, and I'm recommending to pull two 48's or two 53's, but with a master driver, with big engines, low speeds like 55 miles an hour, but only on four lane highways, and make it safe.

But to put more weight than 80,000 pounds on any one trailer today, I think would be stretching it.

Mr. MINETA. Thank you very much.

Mr. WALTER. Congressman Mineta, I've heard our folks talk about that, too, and I think they would like the same position.

Paul Carter, our Finance Officer, is here, and Paul, you probably know a little bit more about that than I do. Would you care to comment on that? Have you got any feeling for it?

Mr. CARTER. I think that's basically the position our people hold, the transportation crew—is what you said.

Mr. TYSON. I believe that limit, that 80,000 pound limit, should do it as far as we're concerned, but that would just be our position.

Mr. MINETA. Thank you very much, Mr. Chairman.

The **Chairman**. I want to thank the panel very very much for their presentation.

Mr. Hancock? I'm sorry.

Mr. **Hancock**. Just real briefly, I think I would be remiss—We're talking about the partnerships. My district is the Southwestern District, the Seventh District of Missouri. I've always considered Northwest Arkansas, Southwest Missouri, and Oklahoma, of being in a partnership, kind of an economic entity, and I just think I would be remiss.

I have been hearing a lot about Oklahoma, but I want to mention Missouri in this, too, because this is an area that is the population growth center. You know, the tourism industry is a major industry for us here, and the north-south links on tourism is one of the keys to the development of Northwest Arkansas, and Southwest Missouri, and Northeastern Oklahoma.

Thank you, Mr. Chairman.

Mr. **Tyson**. Mel, it may not have anything to do with it, but we're proud of our hillbilly heritage here in Northwest Arkansas, and you folks are in the hills, as well, in South Missouri, as well as Eastern Oklahoma. Maybe that has something to do with the entrepreneurship that we're talking about, as well.

Mr. **Rahall**. I can't let that go by—as well as West Virginia.

Mr. **Tyson**. You're right, my friend.

Mr. **Mineta**. We've got a great degree of it in Silicon Valley, as well.

The **Chairman**. Any further questions? If not, thank you very very much for your presentation.

Our next panel of witnesses will be addressing aviation needs. Mr. Leonard Griggs, the Assistant Administrator of the FAA; Mr. Fred Davison, Chairman of the Arkansas Aeronautics Commission, accompanied by Mr. Tommy Hancock, Director of the Arkansas Department of Aeronautics,; Mr. Raymond Ellis, a member of the Chamber of Commerce and Aviation and Air Transportation Task Force; and Mr. James Rodgers, Manager of a Little Rock Airport.

I know that Mr. Griggs has to leave very short, so let us begin with Mr. Griggs.

Mr. **Hammerschmidt**. Mr. Chairman, before Mr. Griggs begins—first of all I want to welcome all the members of the panel. Let me say that Mr. Max Hall is going to bring a statement from Mr. Davison who was held up because of the weather in Little Rock, so Mr. Hall will be representing Mr. Davison in reading his statement.

The **Chairman**. Mr. Griggs.

TESTIMONY OF LEONARD L. GRIGGS, JR., ASSISTANT ADMINISTRATOR FOR AIRPORTS, FEDERAL AVIATION ADMINISTRATION

Mr. **Griggs**. Well, Mr. Chairman, I'm Leonard Griggs, and thank you all very much.

I think I understand the secret now, it's called enthusiasm, and coming from Missouri, I'm supposed to go back to my daughter's engagement party this afternoon, and I'm not too sure I shouldn't have held it here. Thank you all very much.

I am pleased to have this opportunity to appear before you all to discuss the aviation infrastructure needs of Northwest Arkansas.

As you all might or might not know, the FAA's grant program, which is authorized by this committee, has been the key factor in making available substantial assistance to airports throughout the country.

Since the enactment of this program in 1982, we have issued nearly 10,000 grants, for $8.9 billion to help finance airport development and planning projects at our Nation's airports.

These have included funding for land acquisition, runways, taxiways, aprons, safety and security equipment, noise mitigation, and terminal buildings.

This year alone, our program level is almost $1.5 billion, and thanks to this committee, if it passes the House and the Senate, our program level could be over $1.6 billion next year.

There remains a pressing need for a strong airport program today, particularly with the capacity problems our Nation is experiencing, which were highlighted today by a couple of the witnesses.

There is a clear need for significant capital improvement to increase capacity, if we are to meet the growing demands of the travelling public.

I know as the former Airport Director in St. Louis, I was the recipient of an awful lot of money approved by this Committee.

Secretary Skinner's National Transportation Policy recognizes that a continued strong local presence in planning and financing is critical, and you heard that echoed here today.

Additionally, we have supported, and the House of Representatives has passed legislation that included a Passenger Facility Charge which would provide a local community option of charging airline passengers a modest fee to assist in financing local projects.

Aviation is the absolute cornerstone of economic vitality in the United States and in Arkansas.

Since 1982, through the AIP Program, a total of over $90.6 million has been approved for airports in Arkansas. Of this total, $39.4 million was in entitlement funds; the remaining $51.2 million was from discretionary money of which this year we hope to have $165 million plus.

Aviation, both air carrier and general aviation, is particularly important to Northwest Arkansas, where the highway system, as you have heard today, requires time consuming travel through small towns, and in some cases, mountainous terrain.

It is absolutely clear that a modern well maintained system of airports is important to foster the timely and efficient transportation of people and goods.

There are nine existing airports in this region, and it's important that I cover those for everybody's information.

Two of these airports are primary airports with air carrier service. The remaining seven are general aviation facilities. Four of these airports have received more than $1 million in airport grants, and through the end of 1990, Fayetteville, almost $4.5 million, Fort Smith, $6.32 million, Rogers, $3.94 million, and Springdale, $1.97 million.

There are also a variety of ongoing and planned projects at nine airports in Northwest Arkansas.

At Fayetteville, we have a multiyear grant of 1.25 million for obstruction removal, safety improvements, and airport rescue and fire fighting vehicles.

We anticipate also that this airport may be undertaking additional work in FY 1991, for an extended safety area.

At Fort Smith, there is a multiyear grant of $1.7 million for taxiway reconstruction and runway lighting.

Bentonville has a current airport master plan underway with a $13,000 federal grant, and as a result of this study, may initiate a runway extension project in the future.

At Berryville, we anticipate the airport may undertake a project in FY 1992 to extend and widen the runway.

We expect a forthcoming project at Harrison, and at Russellville, a planning study is anticipated.

We also see a project in FY 1991, in Siloam Springs, to reconstruct an apron and a taxiway, and at Springdale, we anticipate an FY 1992 project for land purchase and apron construction, and a project in FY 1993 and 1994 to reconstruct the runway and taxiway.

Clearly, the aviation officials in this area and state are working hard to upgrade and modernize their facilities to better serve the traveling public.

Under our Facilities and Equipment Program, we have scheduled an ASR 9 airport radar which will be very very important. This state-of-the-art radar will be located in the vicinity of the Fayetteville airport, and will be used to provide radar air control services for these airports within approximately 40 miles of Fayetteville. Radar data will be remoted from Fayetteville to Fort Smith, Arkansas, enhancing safety and improving the air traffic control tower operation.

In closing, Mr. Chairman and Members of the Committee, I want to state that we in the FAA recognize the importance of a strong aviation infrastructure and a strong economy in Northwest Arkansas.

As I've heard today, you all would like to see a planning program started for a regional airport, similar to Alliance. As you might or might not know, and I would like to elaborate on this, the FAA does not build airports. However, I am very encouraged by the leadership and the progress that I've seen here today, and Mr. Chairman, we will be more prepared to sit down with the state officials and work with you all to see if we cannot start the planning process.

If the planning process proves that this is, indeed, as practical and as pragmatic as we have heard, we will certainly participate in it.

[The prepared statement of Mr. Griggs appears on p. 1682.]

The CHAIRMAN. Well, thank you, Mr. Griggs, and I know that you have to be out of this room at 10:30, and that's in about five minutes, so I'm going to change our procedure a little bit. I will ask our question of you, let you go, and then bring the rest of the panel up and we will start over again.

Mr. GRIGGS. I deeply appreciate it. I only wish I was having the ceremony down here, sir.

The CHAIRMAN. Well, there's one thing, your answers are going to have to be short, too.

Mr. GRIGGS. I'll try, sir.

The CHAIRMAN. How important is general aviation and the condition of rural aviation facilities to the economic growth in this area?

Mr. GRIGGS. I think it is absolutely important, sir. If you take a look at the highway infrastructure, if you take a look, as others have testified, at the difficulty of getting in here, aviation is the entrance to it and the exit from it, and I think it's demonstrated across this nation.

Unfortunately, a lot of all we hear is major hub airports. We hear about Dallas, we hear about the new airport in Denver. But at all of these major hub airports, if you don't have a relief system, if you don't have a smaller airport, and in an area like Northwest Arkansas, if you don't have a system of strong airports to sustain it, you're not going to have the growth, sir. It's absolutely the key, and essential.

The CHAIRMAN. John Paul, do you have any questions, or any——

Mr. HAMMERSCHMIDT. No. I want to thank Mr. Leonard Griggs for being here. You know, he is the Assistant Administrator for Airports for this whole country, and it's very important that he be here. I'm sorry that you can't stay and hear some other very important aviation people, Mr. Griggs, like Jim Rodgers from Little Rock, and Ray Ellis, who is an institution, and Max Hall, who is a pilot and representing Mr. Davison.

I know you have to go, but also you will get their testimony, and I am sure you will have an opportunity to go over it. So, we very much appreciate your coming and being here.

Mr. GRIGGS. Well, let me say, sir, I have known Mr. Rodgers for a great number of years, and thanks to your subcommittee, we just gave Little Rock last week almost a $3 million grant, and I think you will see big things at their airport, also.

Mr. HAMMERSCHMIDT. While you're here, I might mention they have an ILS problem, but we will discuss that at another time.

Mr. GRIGGS. Sir, we just gave them a grant for $1 million. The ILS will open the runway. It has been resolved, sir.

Mr. HAMMERSCHMIDT. Wonderful.

Mr. GRIGGS. They are not going to build anymore runways with that ILS, sir.

The CHAIRMAN. Any other questions before we release him?

Mr. MINETA. No, but Mr. Chairman, I just want to thank Colonel Griggs for being here.

The CHAIRMAN. Thank you, Mr. Griggs, and we will release you at this time.

Mr. GRIGGS. Thank you, sir.

The CHAIRMAN. Our next witness is Mr. Max Hall, Engineering Services, Incorporated from Springdale. I think you are also representing Mr. Davison.

Mr. Hall.

TESTIMONY OF MAX HALL, ENGINEERING SERVICES, INC., ENVIRONMENTAL AND SANITATION LAND SURVEY AND DEVELOPMENT AIRPORT DESIGN, SPRINGDALE, AR

Mr. HALL. Mr. Chairman, Congressman John Paul Hammerschmidt, and Members of your distinguished committee, Mr. Davison has unfortunately been delayed due to the weather.

Mr. Davison asked that I read his statement for him, and also, Mr. Davison sends his regrets that he cannot appear before you and his most sincere appreciation to the Congressmen for holding your hearings in Northwest Arkansas.

I will now read his prepared statement.

Dear Congressman Hammerschmidt:

I am pleased to receive your invitation to participate in your committee Hearing on Saturday, September 8, 1990.

There are 22 Public Use Municipal Airports in the 3rd Congressional District.

This includes four Commercial Service Airports. Eighteen [18] of the airports are in the National Plan of Integrated Airports Systems. There are five heliports at hospitals in the 3rd District.

Attached are portions of the Arkansas Airport System Plan which identify and project expected growth in the 3rd District to the year 2008. The 3 volume Systems Plan was prepared in 1988-89 for the Federal Aviation Administration and our Commission by the engineering firm of Barnard Dunkelberg and Company and Garver and Garver, Inc. The plan is a guide for aviation development in the State of Arkansas. Our airports will be linked closely with economic growth and development.

The following attachments show:

1. Planning districts composed of counties with generally common socioeconomic considerations.
2. Arkansas airports in the National Plan of Integrated Airports Systems.
3. Forecasts of general aviation operations at public use airports. Those in the 3rd District are identified by county. These projections are based on population growth trends, number of commercial air operations for passengers and freight, and general aviation needs.
4. A record of state funds provided to airports in the 3rd District over the past five years. These funds are derived from sales tax on aviation fuels and aviation related products. No funds are received from General Revenue.

Problems: In general, the counties in north and west Arkansas are in far better shape in their local participation in airport development than most other areas of the state. The problem common to all is funding. In order to relieve some smaller communities of cash burdens, the Arkansas Aeronautics Commission has accepted payment in kind—the use of local city and county road and other equipment, as qualifying on a 50-50 basis in lieu of cash payment. Terrain features in northwest Arkansas are also a problem in some communities when developing or improving an airport. A current example in the 3rd District of these problems is the development of an airport at Marshall in Searcy County.

Sincerely, Fred Davison, Chairman, Arkansas Aeronautics Commission.

Gentlemen, there are a series of maps and charts attached here that he would have liked to have explained to you. I believe they are self-explanatory, and in the interest of saving time, they do follow along with the letter, and I will dispense with that.

[The prepared statement of Mr. Davison appears on p. 1687.]

The CHAIRMAN. Thank you.

Mr. HAMMERSCHMIDT. Mr. Chairman, by unanimous consent, I would ask that all that be made a part of the record.

The CHAIRMAN. Yes, it will be made a part of the record without objection.

Mr. Ellis.

TESTIMONY OF RAYMOND J. ELLIS, CHAMBER OF COMMERCE, AVIATION AND AIR TRANSPORTATION TASK FORCE

Mr. Ellis. Mr. Chairman, Congressman Hammerschmidt and Members of Congress. Thank you. We're happy to have you here.

About all I can say, at this time, is to second the motion of those who have preceded me.

I am a native of Arkansas, a long time resident of Fayetteville, and have an extensive background in air transportation.

I might add here that most of these gentlemen who preceded me in their statements, that we have helped all of them to get started in the airplane business.

Northwest Arkansas is located at the heart of the nation. It is at the crossroads of America. It is an educational, food producing, merchandising, and transportation area, all of which has made it one of the most progressive, fastest growing, and economical centers in the country.

The University of Arkansas with its state and nationwide impact is the nucleus and base from which the areas has grown, and it is the catalyst for continued growth.

We have some of the largest and leading trucking firms in the country based here. J.B. Hunt and Arkansas Best Freight. We have the leading poultry producers, some of which are Tyson's, George's, Peterson Industries and Hudson Foods, and we have one of the top merchandising companies, Wal-Mart.

All of these companies grew up and are based in Northwest Arkansas. All of them have contributed massively to the growth, development, and economic base of the area.

All of these institutions and businesses have used the airplane as a business tool in the building of their own businesses. They have made great use of our airports and air facilities, and created great demand for public air services. Efficient, convenient, and safe airports and air service are vital to them as well as to the general public.

Northwest Arkansas has an outstanding system of airports and airways facilities, and until now, these facilities have kept pace with the growth and development of the area. But they are being outgrown.

What we need now are improved airways and air traffic facilities and an air carrier regional airport, in order to meet the needs of this progressive area.

Drake Field, Fayetteville, which has served as the regional facility for many years, has one of the major, and most impressive emplanement statistics records in the central part of the country. These statistics have confirmed that fact and have exceeded the forecasts made in previous years.

Drake field is served by four commuter airlines having connections with five major airlines at hub cities in the surrounding states. This commuter airline growth developed from the earliest air service companies serving this area, with Scheduled Skyways and Frontier Airlines as the base, both of whom have been merged with newer, and larger, and more progressive airlines.

The commuter airlines serving this area are very positive in their need for an all weather airport meeting the national standards for a safe and highly efficient airport. A regional airport serving the public's need is vital to the continued growth and development of this area.

Of critical value to the national airport systems is the fact that a new airport facility which can serve Northwest Arkansas, can also serve mid-America as a reliever airport to alleviate congestion at major air hubs of the heartland. In relieving airport congestion, air space, ground access, noise and air pollution problems are relieved as well.

Federal and state transportation funds are available through transportation trust funds, up to 90 percent of which can be used for the development of airports and airport facilities. User taxes, federal and state, on airplane tickets, fuel, and sales taxes, have been accumulating in trust funds, and will continue to be paid into these funds.

Teams and organizations are ready to raise the local funds and to start the action. We are asking you to help us in this project.

Thank you, we appreciate you being here.

[The prepared statement of Mr. Ellis appears on p. 1671.]

The Chairman ANDERSON. Thank you, Mr. Ellis.

Mr. Rodgers, James Rodgers from Little Rock.

TESTIMONY OF JAMES R. RODGERS, AIRPORT MANAGER, LITTLE ROCK REGIONAL AIRPORT

Mr. Chairman, Congressman Hammerschmidt, Committee Members, ladies and gentlemen. I would like to thank you for inviting me to speak at your committee hearing to comment on the future infrastructure needs of Arkansas, especially as they relate to airport development.

For many a visitor to Arkansas, the airport delivers the first impression of our state. The airport is one of the most visual and tangible links in reaching beyond our borders. The business traveler, the increasing number of convention goers, the "Natural State" vacationers are all impressed with what we have to offer. The presence of quality air transportation is a state attribute. But the airport also serves as the backdrop for another thriving economic force. As an example, what has taken place in central Arkansas.

Beyond the airport, business leadership believes strongly that a growing Arkansas airline industry provides a catalyst for other opportunities that benefit the entire community and state. Our commitment to the future is evident with our long-term capital improvements to accommodate projected increases in air traffic.

In the next year alone, about $25 million will be spent on improvement projects already under construction. Two of those projects will be the completion of a new $60 million parallel runway that is expected to be operational in the Spring of 1991. The next is a 45 acre campus costing roughly $16 million for a tenant at Adams Field, British Aerospace. That is to be completed by the Summer of 1991.

But our capital improvement plan doesn't stop there. We project our needs for the next 10 years to be in excess of over $50 million to meet the ever increasing demands that are placed on our facilities. New and expanded access roads will be needed, land will have to be acquired, maintenance of existing and construction of new runways, taxiways, and aircraft parking aprons will be required.

I believe that now is a particularly appropriate time to reflect on the commitments that must be made by the various entities involved with providing a strong and healthy environment essential for the continued growth of aviation.

The various entities that must provide total support are:

1. Federal Government. We must continue to see responsive as well as responsible legislation out of Washington, such as the most recently passed Reauthorization Bill which now includes Passenger Facility Charges. Nothing is more frustrating to those of us in the industry than to see a doubling of the number of people we serve experience strains on the system; both in the air and on the ground, know that funds are being collected, and yet not made available to significantly reduce this ever increasing demand. The amount approved in H.R. 5170 for airport improvements, modernization of the airway system, research and development, and the FAA's operations and maintenance fund is never enough, but they certainly are much more realistic and given the ability to assess PFCs, they go a long way towards meeting the nation's need for increased aviation capacity.

The Federal Aviation Administration, also a partner, must also continue to be sensitive to the various needs of individual communities and how each need must address community concerns, but also fit into strengthening the overall aviation system.

The second partner, state government. The state agencies interested in promoting aviation development must understand that it goes beyond just economic development for a given community. It also requires responsible legislation and dollars to construct, expand, and maintain facilities. The right legislation can be fashioned into an extremely useful tool to help local communities become much more attractive in encouraging new entrants into a market.

And last, but certainly not least, local governments and authorities. The new voluntary charges and increase in appropriations, if approved, is the beginning of an opportunity to provide first class facilities for those living and visiting our communities. The traveling public deserves the best airways facilities system that we can provide.

The entities involved have made considerable progress in achieving this system, and it is certainly within our power to further consolidate this progress.

Thank you.

[The prepared statement of Mr. Rodgers appears on p. 1745.]

The **Chairman**. Thank you, Mr. Rodgers, and I am going to ask the question again that I asked before Mr. Griggs left, and I would like to have you comment on it, if you would, please.

How important is general aviation and the condition of the rural aviation facilities to the economic growth in this area? And that's to all of you.

Mr. **Rogers**. Mr. Chairman, we consider it extremely important. The facility that we have there in Little Rock is a joint use facility. Certainly air carrier NGA, utilizes that facility.

For Arkansas, being the rural state that it is, general aviation is almost essential. It's one of the primary means for our citizens to get throughout the state, and certainly beyond the borders.

So, we are extremely supportive and certainly supportive of any reliever type of facility that can be funded.

The **Chairman**. Any questions? Mr. Ellis?

Mr. **Hammerschmidt**. Well, Mr. Chairman, before Mr. Ellis makes his comment, let me tell you a little bit about Mr. Ellis.

He is the granddaddy of general aviation in Arkansas.

Mr. **Walton**. That's appropriate, John Paul, I'm glad you brought that up. Ray taught a lot of us how to fly a hundred years ago.

Mr. **Hammerschmidt**. That's right.

Mr. **Walton**. Go ahead.

Mr. **Hammerschmidt**. Well, I was just going to say that he's an institution here, and he is the forerunner of general aviation certainly in western Arkansas. We're delighted that he's with us today.

Excuse me for the interruption, Ray, but I wanted to tell my colleagues who you were.

Mr. **Ellis**. Thank you, thank you, John Paul.

General aviation is—let me explain this. In other words, air transportation is divided into three basic divisions. First, there is the military, then the air carrier, and all of the rest of the activities in aviation is lumped into one division, general aviation.

The greatest contribution that has been made to aviation in this part of the country is through general aviation.

In other words, even though our air carrier development has been important and contributed greatly, general aviation has contributed the massive benefits to this area.

Mr. **Hammerschmidt**. Let me also comment about the next person that's getting ready to respond. Max Hall is a general aviation pilot, not only of airplanes but of helicopters. He has a great war record in Vietnam and is getting ready to have one in the Persian Gulf, it looks like, because he's a reservist. But anyway, we are delighted to have you before us, Max.

Mr. **Hall**. Mr. Chairman, let me direct a couple of comments in response to your question there.

Over the last 20 years, in my private practice as a civil engineer, I have watched the growth of communities around the state. Those communities that have two items there, one a suitable industrial park, and secondly, a suitable airport, have experienced a fairly stable economy. We can look at other parts of the state and not see that.

In other words, those that have an active general aviation, and have a facility to get in and out, have been able to maintain their economic levels within the community, and have been fairly stable.

I think it's important to note that in some areas when FAA was not able, or the Arkansas Department of Aeronautics, to help a particular community retain their jobs or improve their jobs, the Arkansas Industrial Commission has stepped in and assisted numerous committees in Arkansas for economic development, and has recognized the value of the general aviation airports toward maintaining and improving the number of jobs within a community.

The **Chairman**. Any further questions?

Mr. Roe.

Mr. **Roe**. I would like to ask a question that's on my mind. What has been the growth in air freight?

Mr. **Ellis**. The growth in air freight has been tremendous in this area. For example, Federal Express has been a big factor. In other words, it has been served by companies like Federal Express, and United, UPS, and our air freight has grown tremendously. It would be hard for me to say just how much that the benefits have been, but I know that Federal Express has been vitally interested in an airport development in this area.

In fact, Fred Smith was a stockholder in Skyways back in the early days, and has been a supporter of it, and the air freight has been tremendous. I can't tell you the exact figures on it, but it has been a tremendous factor.

Mr. **Hammerschmidt**. Will the gentleman yield?

Mr. **Ellis**. Yes.

Mr. **Hammerschmidt**. Just as a matter of information, I think it's kind of interesting—you know, we are proud of our entrepreneurs in Arkansas, but Fred Smith started his business in Arkansas, and then later he moved it to Memphis, which was his home. But anyway, I wanted you to know that he started in Arkansas.

Mr. **Roe**. I'm just looking over the field to see how many firms are going to be moving from Arkansas into New Jersey. I just wanted to observe that fact.

I think the air freight issue is important, and I think one thing we have to get across is some people take the approach that to build another airport is an important thing—and of course, it is—but I think the way you are locking it into the economic development of the region with your trucking aspect, your highway aspect, into the intermodal relationship as far as air freight is concerned, I think is a vitally important issue and I thank you for your answer.

Mr. **Ellis**. They compliment each other.

Mr. **Packard**. Mr. Chairman?

The **Chairman**. Ron.

Mr. **Packard**. I'd be interested to know after you have reviewed the needs of your airport services for Northwestern Arkansas, do you feel that the existing infrastructure that you have can be upgraded and expanded to meet the needs and the future needs, or is it going to require new facilities? I'm talking now about passenger carrier as well as general aviation.

Mr. **Ellis**. The new facilities are vital in the airports and also in our radar controlled areas, and we have a vital need for it, and if they are in the plans to bring—of restructuring our airways, Northwest Arkansas is a key area in the reshaping of our airways and airspace, and there isn't any question but what new facilities like the regional airport—in other words, a control area, a center, we need, in connection with our control system. They are definitely needed. We will have to have new facilities in that respect.

Mr. **Packard**. Well, Mr. Chairman, if I may. Have local agencies identified, and regional agencies identified, a site for a regional airport, a new regional airport?

Mr. ELLIS. Yes. In other words, numerous studies have been made in the past, and local sites have been part of—are known. In other words, it should be located in the central part of the northwest Arkansas area, which is near the Tontitown area. The need at that location has been established.

Mr. PACKARD. Thank you, Mr. Chairman.

The CHAIRMAN. Mr. Lightfoot?

Mr. LIGHTFOOT. Thank you, Mr. Chairman. Just a quick question. I got here under general aviation aircraft, and the people who have access to that with Bentonville, Springdale, Fayetteville, have some actual facilities to get in and out of. But as Mr. Walton mentioned earlier, that with his company, they like to bring people here for that face to face contact.

Do you have any idea how many people come into this area on a daily basis, who cannot get here because of a lack of commercial routes coming in that have to, say, fly to Tulsa and drive over on this road which needs to improved, or some other area? How many folks do we have on a daily basis that if you had a regional facility, would be coming right here, rather than spending many hours on the highways trying to get here?

Mr. WALTON. I could answer that probably as well as anybody—if you'll excuse me.

Mr. LIGHTFOOT. Sure.

Mr. WALTON. Would you mind if I reply to that?

Mr. LIGHTFOOT. No, go right ahead.

Mr. WALTON. You're the Congressman from Iowa, in fact, Shenandoah, right?

Mr. LIGHTFOOT. You've got it.

Mr. WALTON. I had this information awhile ago. We have an average now of over 1,000 vendors, suppliers, and manufacturers, visiting Bentonville a week, in an average week, at this point in time.

Ray knows better than anybody. He's been flying in and out of Drake Field for years. Many, many times that facility is not all right, because of the weather problems that we have, so often we have to rent a car in Tulsa, and I expect every third or fourth of them fly into Tulsa, rent a car, and drive to Bentonville. They have to get here the best way they can.

It's just very difficult to get in here from New York, Chicago, or from the Orient, or anywhere else, and so often, as good as the service is at Drake Field, there are many days that they can't get in because of the weather.

And of course, as our company grows, and as Tyson's and all these other small and middle sized companies in Northwest Arkansas grow, I think the problem is just going to be compounded.

I know that represents a fair figure, at this point, for Wal-Mart. If we do what we hope to achieve, that number is going to increase, and increase, and increase, and the problem will get greater, and greater, and greater, and more dangerous as well.

Mr. LIGHTFOOT. Thank you, Mr. Chairman.

The CHAIRMAN. Another question?

Mr. HALL. Mr. Chairman, let me add a comment.

As was said earlier, we have nine airports in Northwest Arkansas, not any of which are suitable for the purpose of today's needs.

There's nine up here, and not any one of them lend theirselves to expansion to meet tomorrow's need.

Drake Field has done us well over the years, and we have other airports that are very good for their use in the past, but for today's needs and tomorrow's needs, Drake Field, due to the terrain and the weather that's associated with it, it does not lend itself to further development, and cannot meet tomorrow's needs. It has done well in the past and we're certainly not critical of it.

So, the regional airport concept is a necessity, not only for today but for tomorrow, to meet the needs of the area.

The CHAIRMAN. Thank you.

Any further questions?

Mr. INHOFE. Just one comment, Mr. Chairman. Until such time as the regional airport is in place, we in Tulsa enjoy your business.

The CHAIRMAN. Okay. Well, thank you very very much for your presentation.

Mr. HAMMERSCHMIDT. Thank you.

The CHAIRMAN. Our next panel of witnesses will be addressing Surface Transportation needs. They are Dr. Thomas Larson, the Federal Highway Administration; Mr. Raymond Pritchett, Chairman of the Arkansas Highway Commission, accompanied by Mr. Maurice Smith, Director of the Department of Highways and Transportation of the Arkansas Highways Transportation Department; Mr. Bobby Hopper, Commissioner of the Arkansas Highway Commission; and Mr. Robert Young, President and Chief Executive Officer of the Arkansas Best Corporation.

Welcome, gentlemen, and if we could begin with Dr. Larson.

TESTIMONY OF DR. THOMAS D. LARSON, ADMINISTRATOR, FEDERAL HIGHWAY ADMINISTRATION

Mr. LARSON. Good morning, Mr. Chairman, our host, John Paul Hammerschmidt, and distinguished Members of the committee.

This is a very special treat for me. I have not had the privilege of appearing before such a large number of the Public Works Committee Membership.

I have worked on a more singular basis. I spent eight years in Pennsylvania as a Commissioner, and my Representative was Congressman Shuster, and I thought that was all I needed. It probably was. Since that time, I have gotten to know many of the other Members, and I have to say in a very sincere way and before this entire audience, that working with Secretary Sam Skinner, working with this distinguished committee is certainly the high point of my professional career.

I have been in transportation my entire life, and to work in this arena and to work in a topic area where people obviously care a great deal—As we listened to these distinguished Americans this morning, and heard of their goals and aspirations, and realizing that I can in some small way perhaps have an influence, is really a remarkable privilege for me to enjoy at this point of my life.

A few months ago, our host Congressman John Paul Hammerschmidt, stated in this committee's May 1989 infrastructure testimony, and I quote, "The development of infrastructure to support economic growth is crucial to the development of any area, and there is a legitimate role for the Federal Government to play in ensuring that all regions of the country are able to utilize their resources, develop the necessary infrastructure, and learn to bring about their own expansion and development."

It would be hard to begin with any better words than these concerning the role of infrastructure.

I thought what I might do is expand in just a few moments on the economic impact of transportation infrastructure, and then I will give a few observations on the present circumstance, because one of the functions of federal highways is to monitor the condition of the highways and bridges on a nationwide basis.

I will give just a few remarks on that, and then I will close with a few thoughts on reauthorization and why some of the things that are at least being thought about by the administration play very well here in Northwest Arkansas, in my opinion.

First on the matter of economic impacts, I had an academic background before I came into the public sector, and I'm pleased that my colleagues in academia are catching up with the practitioners and becoming willing to admit that there is, in fact, a very direct linkage between transportation and economic growth and productivity.

People like David Ashower in the Chicago Federal Reserve Bank, people at Harvard, people now on the President's Economic Council, are saying, "Yes, by George, there is an impact," and we can prove it economically. Mr. Walton knew that a long time ago, but there are now important people, and people that are advising in high circles, that are making important contributions in this arena.

One observation here that is important, and is that if there is going to be this productivity enhancement, if there is going to be this positive economic impact, there indeed has to be a targeting. You can't make random investments and have the kind of impact that you might want, and so here in Northwest Arkansas, we have heard of a pattern of investments that are intended to have a very particular kind of a consequence.

The interstate system that is now essentially complete had that advantage. It was a targeted system stating that here is a pattern of investments that will affect the country, and it would be hard to argue that that investment strategy has not worked in a very remarkable way.

Turning to the second topic, that of the current situation, there are a lot of things that make assessing current needs in a current situation very very difficult. It is indeed a slippery place to stand when you start talking about what are the needs, or what are the conditions, in a national sense. It's much easier to talk about the needs in Northwest Arkansas than for the United States of America, but that's a job that we have to deal with.

Travel trends, the condition of the roads at any particular point in time, the performance of the highway plan as to the congestion, all of these things have to be dealt with.

On an aggregate basis, in dealing with travel first, we see a continuing growth in travel, 2 to 3 percent, up through the year 2005. Historically, it has been higher than that, and clearly the energy availability can impact that dramatically, as we saw during the

70's, but we have to make a projection, and it is that 2 to 3 percent annual growth that we are anticipating.

It's very uneven. There are places in the country where it is growing much much faster than that, but that, again, is a national figure.

The condition of the nation's infrastructure, transportation infrastructure, is again an uneven picture. There are three areas where there are particular needs.

One is in the rural interstate highways. Those have shown a decline. The bridges on the federal-aid system have slipped, and in the urbanized area there is rampant congestion growth that is imperiling the growth in almost all of our major metropolitan areas.

In the metropolitan areas, congestion has become for many people the number one problem of an area. A poll taken, for example, in California, in the San Francisco Chronicle, a few months ago said that congestion in the Bay area is the number one problem.

Rush hours are now in some places extending all day and well into the morning and evening. It is an occurrence that has gone well beyond the peak hour phenomenon that we saw in the past.

One of the things about federal highways is that bi-annually we try to assess, using factors such as I have just named, and others, the national circumstance. The last report was June, 1989. And on the basis of the travel forecasts that I have mentioned, the condition that we find, we have anticipated a $606 to $703 billion need in 1989 dollars, over the period of 1987 through 2005. This would be to eliminate the backlog and meet, just meet the accruing needs, and if you take this into an annualized basis, you're talking about $32 to $37 billion.

Now, this doesn't deal with the congestion in the urban areas and it doesn't deal with the bridges. I won't go into all the bridge details, but we estimate that as another $100 billion, so that if you add up all of these numbers, the system needs for highways: $32 to $37; for bridges: $5; or a $38.3 to $42.3 billion national need, and this is a total investment, and not just the federal share. And I'm happy to say to Arkansas, my colleagues, and to all of the other states, that they have stepped forward magnificently to the responsibilities from a state level. That is one of the real success stories in our overall program.

We are doing things in non-construction ways. We are trying to institute in a very aggressive way, what we call intelligent vehicle highways, to make the highways safer for trucks, for cars, and to increase their capacity.

Certainly, in Chairman Anderson's district, we have some very exciting technology being used. But after all that is said and done, there still will be a very major investment. Certainly, as I have listened here to the needs in Arkansas for Highway 71, and 412, these are needs that are going to have to be met in the good old fashioned way, by building added capacity, by improving what is there.

The last point that I was going to make and this will play back to the Arkansas circumstance, is regarding what we see for the future.

Secretary Skinner has had a very aggressive program of listening and traveling. I think that it would be hard to find a Cabinet Secretary who has made a greater effort to learn the business and to meet the major actors in the business than Secretary Sam Skinner has done over the past months.

As a result of that, a policy statement was advanced. It was advanced as a framework, a framework within which all the players could find the kind of support that they needed.

Some of the things that we believe are important from that policy.

First, that the balance in the Highway Trust Fund should be used in a fiscally responsible manner.

The Trust Fund, interestingly, is probably one of the many unfortunate fall outs of the Vietnam War. That balance started in the 1970's, and has consisted, by and large, in an even fashion since the 1970's. We believe that that is a resource that should be used.

We think that there should be an increased reliance on user fees, and we want more private sector involvement, and we certainly want to give the states more flexibility to do what they are already doing very well, even better.

Coming back to Arkansas, we think that for 412 and 71, there are some solutions, in the Administration's thinking, at least, up to this point.

We would propose that tolls be permitted, that there be a commingling of federal and private monies, to advance toll projects.

Oklahoma is doing this. I'm proud that in my state of Pennsylvania, we will soon be celebrating the fiftieth anniversary of the opening of the Pennsylvania Turnpike, and it is that continuing growth and continuing financial viability over all those 50 years that has been a major asset to Pennsylvania.

We are putting together, in our thinking at least, and we have requested from the states their thinking, about a highway system of national significance. We would like the states to tell us—we're not going to tell you—we want you to tell us how you want to put together a system of national significance.

Chairman Anderson and Chairman Mineta have, in fact, for California, a first cut at a system of national significance for that state.

And finally, the idea of public-private partnerships of one kind or another. I have heard that word a lot. The kind of power that was represented here in the first panel would seem to me to suggest that there are all kinds of options for putting together new partnerships to get these jobs done.

I can't believe that with what has been accomplished here in Northwest Arkansas, that these two little projects are going to stop you for very long. I'll be amazed if that is, in fact, the case.

Well, we are just delighted to be here as part of this hearing process. We believe that investment in infrastructure is in the very best sense of the word, an investment in America's future.

We think that Secretary Skinner's policy is a framework within which we can do our strategic thinking about transportation. It shapes the thinking of us in the DOT well into the year 2000, and we would like to say that it is the reauthorization process working with this committee and with the Congress, that is the way in which all of this strategic thinking is going to be put into action.

So, again, I am delighted to be with you. This is a privilege of an unusual dimension, and I certainly wish all of the new found friends that I have found here in Arkansas every success as they move forward, and it is going to be a privilege to work with Congress on reauthorization.

Thank you very much.

[The prepared statement of Mr. Larson appears on p. 1702.]

The CHAIRMAN. Thank you, Dr. Larson. They say that you have to leave here at 11:10 to catch an 11:40 plane. I have one question, and if it doesn't take too long, maybe somebody can answer. Let me ask you one before we ask the other Members.

Dr. Larson, we have heard a lot about Highway 71. How do you see this important link fitting into the system of national significance, the proposal that you are developing?

Mr. LARSON. The system of national significance, and we have had direction from this committee to start our thinking about this system, is a system that has to grow from the state level upward.

I can't imagine that one could be successful in relaying on any kind of a national system from Washington. It would be a foolhardy enterprise, in my opinion. So, we have asked the states to give us their thinking, and I would think that if the folks from Arkansas have been listening here this morning, as I have, they would certainly want to give very serious consideration to this project as being part of the system for Arkansas.

That, in our thinking, and this is very preliminary and has not had the benefit of all of the input from this committee obviously, but our thinking is that this national system would have priority. It would have higher match ratio, it would have an expectation of tighter management, better maintenance, something that Chairman Mineta cares about a great deal. It would have priority in a whole lot of ways so that this would be the system on which the entrepreneurs that we have had with us this morning, would be able to move their commerce.

We think this system of national significance is what is going to extend the concept of the interstate system more broadly across the entire market areas of the United States.

The CHAIRMAN. Any other question that anyone has before Dr. Larson has to leave for the airport?

Mr. MINETA. Very quickly. Since that letter I directed to you asking you to get together with AAHSTO, the American Association of State Highway and Transportation Officials, to come up with a definition and criteria for highways of national significance, what is the progress of this, and when do you anticipate that you will have some definition of what we have agreed on as being highways of national significance, to take the place of the interstate defense highway system?

Mr. LARSON. Well, Chairman Mineta, the process got off slowly because of the requirement that we work with a lot of folks.

Internally, we have worked with OMB. Externally, we have worked with AASHTO and with local governments, to craft a specification that would get us started.

We will have a first look at this in late September or early October, and it will probably be towards the end of his year in 1990 or early into 1991, before we could come back with what we would call our first cut.

My sense though, is that this is going to be a negotiation process. If the selections in Arkansas don't meet all the criteria, then we are going to have to go back to the drawing board.

So, I would see a reiteration of this exploration and definition that will go on probably almost up to the time of reauthorization.

Mr. **MINETA**. Well, I would hope that by the time we put our draft legislation together, that we will have some good ideas as to what that criteria might be.

Mr. **LARSON**. You will have those.

Mr. **MINETA**. Thank you very much, Dr. Larson.

The **CHAIRMAN**. Mr. Packard.

Mr. **PACKARD**. I simply wanted to encourage Dr. Larson to look carefully at the north-south and the east-west voids that now exist in this particular area. I think that has been graphically described and demonstrated to us, and certainly that is where we would see the national significance, more than just the local problems that exist.

Mr. **MINETA**. Will the gentleman yield on that basis?

Part of that problem, though, is going to be on how to balance regional needs. Vehicle miles travelled is very important here in Arkansas. In the far west, it may be total road miles. So, the question is, how do we balance those as we determine that?

Mr. **LARSON**. Mr. Chairman, if I may.

On the question of north-south versus east-west, if you look at a map of the interstate highway system, and I happen to have one in my office so I look at it pretty often, it seems clear that sort of the westward ho mentality prevailed when the interstate system was laid out, and we have had a number of inquiries regarding north-south routes, whether it is Shreveport to Kansas City, or whether it's the Avenue of the Saints, or I could go on and name them. But certainly there is a very pronounced recognition of the need for stronger north-south connectivity.

Thank you, Mr. Chairman.

The **CHAIRMAN**. Okay.

Mr. **HAMMERSCHMIDT**. Mr. Chairman, just one last comment.

Dr. Larson, are you going to try to catch that 11:40?

Mr. **LARSON**. Yes.

Mr. **HAMMERSCHMIDT**. I just want to make a closing comment, if I may, Mr. Chairman.

The **CHAIRMAN**. Go ahead.

Mr. **HAMMERSCHMIDT**. I am delighted to hear you comment about the possibility of a toll road and maybe the subsidization or mixing of those funds. We can discuss this further in Washington, and I know we will, but you know, I am going to discuss it with Chairman Pritchett, and Commissioner Hopper, and Mr. Smith, our Director, and users like Robert Young, and Wal-Mart, and Tyson, and so on, but I think that may be part of our answer. But we will discuss that further in Washington.

Thank you very much for the taking of your time to be down here from Washington on this weekend.

Mr. **LARSON**. Thank you very much.

Our next witness will be Mr. Raymond Pritchett, Chairman of the Arkansas Highway Commission.

TESTIMONY OF RAYMOND PRITCHETT, CHAIRMAN OF THE ARKANSAS HIGHWAY COMMISSION

Mr. PRITCHETT. Thank you, Mr. Chairman. Gentlemen, we welcome you to Arkansas. We join those others that have already welcomed you to Arkansas. We are very proud of our state.

With me today is the Director of the Highway Department, Mr. Maurice Smith, and Mr. Bobby Hopper, who you are going to hear from, our Vice Chairman of the Commission, Ron Herrod is also here, along with our Assistant Director, Chief Engineer, and Assistant Chief Engineer.

We look at this as a very important event and a very significant one for the Arkansas Highway and Transportation Department and appreciate the opportunity to be involved.

Thirty-four or thirty-five years ago, the federal transportation policy pretty well focused on the interstate highway system and it is a notable project. I doubt that anybody would argue much that it is probably the most fantastic public works project in the history of the world.

For the last 12 to 15 years, we have been complete with our interstate highway system. We were among the first, and we have patiently, and sometimes impatiently, waited on our sister states to complete their portions of the highway, and there is a growing feeling in Arkansas that we have paid the price for being first and being very responsive to that program.

When you start allocating interstate funds, our's is zero, as far as new construction, and has been for a decade.

More recently, the Congress turned its attention—and I am going to come at this thing from the whole statewide level. Director Smith and Mr. Hopper will talk in specifics about Northwest Arkansas.

You get a lot of different viewpoints, because what Mr. Larson viewed as two little projects down here, sometimes seem almost insurmountable to us in Arkansas, for reasons that I am going to explain to you in a minute.

Congress addressed its attention to this Lower Mississippi Delta Study Commission, and they appointed a blue ribbon committee and these people worked for way over a year and held hearings all up and down the Delta in seven states, going up as far north as Illinois and down to Louisiana and Mississippi.

In their report that has gone back to Congress, they tried, and I think successfully did, draw a link between the relative poverty in the Delta, due to the fact that a lot of the Delta was left out of the interstate program when they were drawing the map in the mid-1950's. I plead guilty. I didn't have anything to do with that, I was in Junior High School in Lepanto, Arkansas, at the time.

Also, they came up with some specific transportation projects that they would like to see done. Most of them are in Eastern Arkansas, but it should be noted out here that one of the important projects that they came up with as a regional project was Highway 412 between Tulsa and Nashville.

As I look at the map that they presented in their report, from the vantage point of a Highway Commissioner who has served now almost 10 years, I thought to myself that if for most of those 10 years, if not all, if Arkansas had not been a donor state, and had the minimum foundation been at 98 percent instead of 85 percent, there probably would have been enough money to make significant improvements on most of those projects from federal funds that now exist, but that were deferred to other states for various reasons.

I checked that with our Chief Engineer and he concurred that that was the truth, and about two months ago, Secretary Skinner was in Little Rock viewing the flood damage in Arkansas and I raised that issue with him. He came back very quickly and raised the issue with me that Arkansas is a nickel behind the national average in fuel tax, and I have reflected on that, that as a result of those two policies, a state policy which lags behind in funding rural, city, county, state highways, a federal policy that takes money that's sent up there from Arkansas in the last fiscal year of $73 million—which is a lot of money to us here in Arkansas and it doesn't come back—a combination of those things, in my term since I've been here, is way over a billion dollars, and enough money to do, and probably to have completed, all those projects that we've talked about here today, and others in the eastern part of the state.

And to the degree that that Study Commission was correct in their assessment that the lack of transportation infrastructure has contributed to the poverty of the Delta, to that degree, the federal policy and the state policy that we've had in the last decade in Arkansas, smacks of being an immoral policy, and the problems with that can be defined in human terms. There is poverty in the Delta of Arkansas, and in this part of the country, it is probably as meaningful, because there are people from Northwest Arkansas that are prohibited from reaching their full potential, and that is something that is almost as devastating and shouldn't happen in a country like America.

We on the Arkansas Highway Commission are working feverishly with our legislature and our people to correct the policy deficiencies that we have in Arkansas of not staying at the national average.

There are a couple of reasons we ought to be above the national average. In our Highway Fund, we have a more than generous split to cities and counties, and I'm not opposed to that, but that is a justification for being above national average.

Also, we operate the sixteenth largest highway system in America. We have 16,183 miles on our highway system. I think we have got more roads than New York and California. We probably have too many, but I am a rural road kind of a guy from Lepanto, Arkansas, and so I am not opposed to that either. I am just saying that those are two reasons why we might in Arkansas in our public policy be above the national average, but in my 10 years as Highway Commissioner, we have been at the national average for five months, and there have been millions and millions of dollars lost because our public policy was not that we were going to stay at least at the national average.

If we correct that in Arkansas, and we get rid of the term, "donor State"—incidentally, five of the seven states in the Lower Mississippi Delta Study Commission are, quote, "donor states," and

I just think that is an indictment of the federal policy that we have now.

As you gentlemen have the awesome task of restructuring the transportation policy of the country, it would certainly be the hope of the people of Arkansas, and the Arkansas Highway Commission, that the minimal foundation be lifted a great deal from 85 percent to 98 to 99 percent, so that we no longer would be a donor state, and we could take those billions of dollars, that if this policy is not changed, we are going to lose in the next decade, and I think if we do that, we can take care of it, and we will have a celebration here in 10 years, instead of a longer list of complaints. We could take care of most of the problems in Northeast Arkansas.

I think it has gotten to the point that this allocation procedure is immoral, and our state and public policy is immoral. We are going to change our's, and I certainly hope that you change your's.

Thank you.

[The prepared statement of Mr. Pritchett appears on p. 1730.]

The CHAIRMAN. Thank you, Mr. Pritchett.

Mr. Maurice Smith.

TESTIMONY OF MAURICE SMITH, DIRECTOR, DEPARTMENT OF HIGHWAYS AND TRANSPORTATION, ARKANSAS HIGHWAY AND TRANSPORTATION DEPARTMENT

Mr. SMITH. Mr. Chairman and Congressman Hammerschmidt, and Members of the committee.

I have just a short overview of the Arkansas highway infrastructure needs.

Arkansas, at this time, is at a critical point in a gap between revenues and needs.

The increasing use and the age of our highway system has caused an increase in deterioration, meaning the spending of available funds on preservation, which is a must.

There is an increased statewide demand for additional four lane highways and mobility for economic development, and additional capacity in our urban areas because of heavy traffic volumes.

Our needs study currently underway indicates that over $7 billion, or approximately $700 million annually over the next 10 years would be needed to meet the roadway and bridge needs and corridor improvements in this state.

On the revenue side, Arkansas is faced with the possibility of remaining a donor state, under some of the future legislation being proposed. We are facing the further reduction of about $50 million come October under the Gramm-Rudman-Hollings Act, and at the state level, we continue to have funds escrowed in the state courts from a weight and distance tax, that currently is the law in Arkansas.

Currently under $200 million is available to meet the needs we discussed and this amount will not even allow us to maintain the status quo. The Middle East crisis may even cause a reduction in the existing revenue.

Over the past few years, we have been making progress on upgrading some of the major corridors to four lane, and have been making plans to continue an expansion program. However, the needs study will cause us to turn our attention more towards preservation. Why? The condition of the state's existing highways and bridges must be improved and measures taken to prevent further deterioration. This will take all of the existing revenues, and severely curtail, if not bring to a halt, the four lane corridor development.

In order to have the program needed, additional funds will definitely be needed at both the state and federal level. Timely completion of four lane and major routes is one need the Commission faces at every corner of the state, and must be addressed in any future program.

For example, it will take a minimum of $180 million to complete Highway 71 between Fayetteville and I-40. Even if we continue in the future as we have in the past to spend $20 million annually, you can readily see that it is not a timely completion for this, trying to improve these highways for Northwest Arkansas.

We must also be aware of the proposed highway legislation. One issue that concerns us and would directly impact future corridor development, is the amount of miles allowed on the national highway system. All of Highway 71 in western Arkansas may not be included in the system now being proposed by the Administration.

We are going to leave you with a paper that will go into detail on these items that we've discussed briefly here today, and this paper will also contain more of Arkansas' needs for the future highway legislation. Information is presented for your consideration on the need for improving Highways 412 and 71.

We thank you for this opportunity to give you our overview of the problems in Arkansas.

I got to thinking this morning when the first panel was up here, with the needs that we have annually, if you all could just take us out of the Highway Trust Fund and give us Sam Walton's corporate income tax, we wouldn't bother you anymore.

The CHAIRMAN. Thank you, Mr. Smith.

Mr. Hopper?

TESTIMONY OF BOBBY HOPPER, COMMISSIONER, ARKANSAS HIGHWAY COMMISSION

Mr. HOPPER. Thank you, Mr. Chairman, Congressman Hammerschmidt and the rest of the committee, welcome to Northwest Arkansas.

I would like to take this opportunity to present the needs for Highway 412 transportation infrastructure improvements in Northwest Arkansas, an area which happens to be one of the fastest growing metropolitan areas in the country.

The focus of my presentation is that there is a need to provide a partial SS control four lane facility between Springdale and Siloam Springs.

Highway 412 is the principal artery connecting the fast growing Northwest Arkansas urbanized area with Tulsa, Oklahoma, and eventually the major interstates to the west such as I-44 and I-40.

Once the plan of a four road toll facility adjacent to U.S. 412 and eastern Oklahoma is completed in late 1991, the segment of U.S. 412 between Springdale and Siloam Springs will be the last remaining two lane link between the Northwest Arkansas urbanized area and Tulsa.

To the east, U.S. 412 provides the only east-west artery across north Arkansas. The immediate need for the improvement of U.S. 412 between Springdale and Siloam Springs is demonstrated by the average annual traffic volume, and the geographic deficiencies of the existing highway, and the resulting high accident rates.

The current volume along this route varies from 8,600 on the eastern end of this segment to about 6,000 near the center.

Traffic volumes are expected to show substantial increases in the next 20 years, and by the year 2010, a volume in the 10,000 to 13,000 range, with trucks comprising about one-fifth of the total traffic volume.

The high traffic volume will cause serious safety problems and intolerable delays for the motorists on this route.

The accident data on this route also points out the need for improvements. Two-hundred forty accidents have occurred on this segment in the last two years. A single one mile segment in the last three years, has had 50 accidents due to inaccurate sight distance and sharp curves.

Because of the adjacent development and numerous residents among the poor existing alignment, very little can be done on this route to eliminate the many highway deficiencies.

Accident rates have averaged 3.63 accidents per million vehicle miles on this route, which is more than twice the statewide average of 1.74 for the two lane rural highways.

Because of the documented need for this facility, the Arkansas Highway Commission has placed a special emphasis on the upgrading of this 20 mile segment.

By Amendment Order No. 89-462, the Commission authorized surveys, plans, and construction of a four lane divided partial access control facility located on a new location.

Although the priority on this route is well established, the fact remains that this project is estimated to cost $60 million, and cannot be completed within an acceptable period of time with the limited funding resources available.

Recognizing the importance of this route and the funding limitations, this route is included in the department's toll road study. If this route proves to be infeasible as a toll road, it might take the department up to 20 years to complete the upgrading of this 20 mile segment, because of the state limited fund resources, even though the need for this project is evident today.

Thank you, Mr. Chairman.

The CHAIRMAN. Thank you, Mr. Hopper.

Mr. Robert Young.

TESTIMONY OF ROBERT A. YOUNG, III, PRESIDENT AND CHIEF EXECUTIVE OFFICER, ARKANSAS BEST CORP.

Mr. YOUNG. Mr. Chairman, I am the President and Chief Executive Officer of Arkansas Best Corporation and ABF Freight System which is headquartered in Fort Smith, Arkansas, about 70 miles south of here. John Paul Hammerschmidt is my Congressman. You need to know that I served as a Page for his immediate predecessor, to give you an idea of how long he has been in Congress. He made a convert of me though, over a period of time.

A.B.F. is a common carrier of general freight. We specialize in shipments weighing less than 10,000 pounds. Last year, we had about $630 million in revenue. We currently are averaging about 20 million miles a month on our nation's highways, or almost a million miles a year. We have 316 terminals located in all 50 States and in Puerto Rico, and in Canada, and we have about 10,000 employees nationwide and in Canada.

My primary interest, as you might have guessed, is in the repair and expansion of our highway system.

Our nation's highways are the vital link that allows the movement of 85 percent of all the furniture, fixtures, and appliances, to market in this country. In addition, 80 percent of all the food, rubber products, and plastic goods produced in the United States, move by truck, and over 70 percent of all the lumber, wood products, and an equal amount of steel, sheet metal, cable, wire, rods, and that type of thing, move over our nation's highways.

Now, in Arkansas, we have the communities of Almond, Tomato, Strawberry, Grapevine, and Appletown to wet your appetite a little bit, and we also have towns named Ben Hur, Pocahontas, Jefferson, Lincoln, and Madison. And right here in Arkansas, if you are an international traveler, we have Atlanta, Boston, Cleveland, Bismarck, Hollywood, Austin, Houston, Denver, Salem, and West Point, Arkansas.

Now, these communities in Arkansas all have one thing in common, they are all served daily by truck. Trucks are in all communities in the United States, and two-thirds are served only by truck.

When one considers that most of America is dependent upon truck transportation, it is a bit disturbing to learn, and I read that 60 percent of the miles in the United States need some form of surface rehabilitation, and over 40 percent of our bridges in this country are structurally deficient or obsolete, and most of us, I think, are well aware of the urban congestion that we have, primarily on either end of our country.

It has been estimated that by the year 2005, traffic delays caused by inadequate roads will cost the United States close to $50 billion a year in lost productivity and wasted fuel.

The impact of inadequate highways in Arkansas is substantial. I drove up Highway 71 this morning, and I had to allow two hours to cover that 70 miles. It is a narrow two lane twisting turning federal highway, and it is the only route from Fort Smith to the Fayetteville-Springdale-Rogers area, which is the corridor of Arkansas that is growing the most rapidly.

Now, I know that there is work being done on that and our State Highway Department, with help from the Federal Government, is doing what they can, and eventually, if I live long enough, I suppose we will have an adequate highway in that route, but it is going to be awhile.

As a substantial user of the nation's highways, I would like to see the following four things happen:

I would like to see more interstate highway miles authorized. Right now, I think there are 4,004,000 miles of highways nationwide, and 155,000 interstates, carrying 55 percent of that traffic—or 45 percent of that traffic. That means that only 3.5 percent of our nation's highways are carrying 45 percent of the traffic.

I would like to see us—and this is not something new you have heard today but it may reinforce it once again—I would like to see you spend the money in the Highway Trust Fund to repair our existing highways and bridges.

I would like to see us triple the amount of money being spent on highway research. I am told that two inches of additional thickness in concrete pavement would double its life span and add only 3 percent to the cost of a new highway.

Spending more on the front end could reduce the never ending inconvenient dangerous repair of our highways. I don't know how many of you have almost been in an accident when you approach a construction area. They are very dangerous. It is dangerous for motorists, and it is dangerous for the people working on that construction.

We need research to tell us how. We should consider setting up 10 different research centers, each governed by a Board composed of representatives of five different State Highway Departments that would involve all 50 States, and the research done by these 10 geographically dispersed research centers could focus on different soil types, on different climatic factors that affect the highway construction techniques, and the longevity of pavement.

What I want to do is do some research so that when we spend the money, we spend it well.

Once we begin to spend the growing balance of the Highway Trust Fund, then I think we need a planned increase in the highway fuel taxes that could be considered for new construction.

It has been shown recently in several states—and Mr. Chairman, in your state particularly with the referendum—that the public will vote for taxes for highways.

Because highways take us from state to state, I think it is appropriate for our Federal Government to provide leadership, matching dollars, and oversight, for an expanded national system of safe and productive highways.

If America's industry is going to compete effectively in the worldwide marketplace, our far flung nation must have safe, efficient, convenient transportation to compete with compact communities like Japan and Western Europe.

Thank you very much.

[The prepared statement of Mr. Young appears on p. 1842.]

The CHAIRMAN. Thank you very much, Mr. Young, and I want to thank the panel, and I will start off with my question as the first one.

As we consider reauthorization of the Surface Transportation Program, and that is going to be the big thing, what issues are most important from your perspective?

Do either one of you want to comment on that?

Mr. PRITCHETT. What one issue—all right, this is going to be one sentence with some commas in it—I think from my perspective——

The CHAIRMAN. Excuse me, Mr. Pritchett, could you pull the microphone up to you? We can't hear.

Mr. **Pritchett**. From my perspective over the last 10 years and looking forward to the next 10 years, I think it is, the issue is going to be funding—now the three commas are—spending down the Trust Fund, removing the donor state status, and probably taking a look at all of these ambitious plans, if 25 to 28 percent is enough of the funding from the federal level, or should there be more from the federal level—local, state and county, about 72 percent or 75 percent, I'm not sure what it exactly is nationwide—but I think in the area of funding, we need some more discretion in the states. This system of the highway national significance might give that.

But we need to spend the Trust Fund down and keep it spent down. We need to do away with the minimum foundation of 85 percent, because it costs us millions of dollars every year, and I include the mass transit penny in that, too. You gentlemen are not going to spend a lot of time waiting on subways in Springdale, Arkansas, or anywhere in Arkansas, while you are here. And to take a look at whether 25 percent is adequate for the federal contribution to this whole thing.

That is my answer.

The **Chairman**. Mr. Hammerschmidt, any questions?

Mr. **Hammerschmidt**. Well, let me thank you all for giving this good testimony. Did you give us some figures on what the total needs are on highways and bridges for, say, the next five years? Is there a found figure for that in Arkansas? If you had all the money you wanted, what would you spend it for?

Mr. **Smith**. If we had all the money we wanted, we would spend about three and a half billion dollars.

Mr. **Hammerschmidt**. Three and a half billion.

Mr. **Smith**. Yes, sir.

Mr. **Hammerschmidt**. I was thinking it would have to be a high figure.

I guess the point I want to make is here, we are a pay as you go state, and I am proud of that fact, because we don't have any Bond Issues hanging over us, and that's great. But because we are, we cannot build like states that pass big Bond Issues and let contracts all at the same time, or we don't have toll road subsidizing of the roads like Oklahoma does, where they let the contracts all at the same time.

But just to be sort of the devil's advocate, if we took all the money out of the Highway Trust Fund—let's just say that we just took it out and gave Arkansas their share—you would get a windfall of about $140 million. Let's say that Congress received the obligational ceiling cap right now, you would get another $69 million. Now, those are big figures and they would help, and you know, we would be delighted if we could do that, but the point I guess I want to make is, it would not solve our problem. We have to have more money in highways and in surface transportation some way or another.

Now, you mentioned that Secretary Skinner said we were about a nickel behind on taxes. What would a nickel tax bring into the state annually?

Mr. **Smith**. It would bring us back, the State Highway Department now——

Mr. **Hammerschmidt**. Yes.

Mr. **Smith**. Not counting the portion to the cities and the counties—it would bring us about $55 million.

Mr. **Hammerschmidt**. $55 million a year. Okay. I was just kind of getting things in perspective. You have got a big big problem, and even though the Federal Government and the state is totally involved and cooperative, the dollars just aren't there right at the time. Isn't that about right?

Mr. **Smith**. That's correct.

Mr. **Hammerschmidt**. But now, toll roads, if you get off into toll roads and users begin to pay in that area, on highly travelled roads, and you had a system whereas you could take Trust Fund money and use it to subsidize the part that the toll road wouldn't pay for itself, then we might get somewhere. Is that your opinion?

Mr. **Pritchett**. We are, and this is kind of in response to a question asked earlier of another panel, but we have hired a consultant to look into several routes in Arkansas for toll facilities. The route has been talked about between the Oklahoma State line and Springdale and Siloam Springs. That report will be due next month. It is a little premature for us as far as that consultant's report is due.

I was encouraged this morning to hear you ask the questions that raises the possibility of subsidization of total revenues to whoever would buy the bonds in this thing, because that means that when we get our study back, it is not necessarily yes, or no. There is some gray area in there, and the state law would have to be changed for the state to do some subsidization in that, and possibly the federal law would have to be changed, but it opens up some more possibilities.

Mr. **Hammerschmidt**. Yes, the federal law would have to be.

Let me ask this. I don't really know, and I don't remember what happened. But do you remember back in the Winthrop Rockefeller days, he had a commission study made by Wilbur Smith & Associates, on 71. If I remember right, the bottom line was, "We can't sell the bonds, because the traffic isn't there to pay for it."

But let's say it was 80 percent feasible, then you would have a 20 percent subsidization. It is along that line that we would be thinking, I assume.

Oh, my question was, is there a toll road authorization? I remember there was a commission appointed that never did——

Mr. **Pritchett**. I'm Chairman of the Toll Road Commission.

Mr. **Hammerschmidt**. So, you are the Chairman of it, too.

Mr. **Pritchett**. Right. We had about $1,500 in the bank when I took over, and I think it is up to $1,800 now.

Mr. **Hammerschmidt**. But you have legislation already in place.

Mr. **Pritchett**. We have legislation in place to have a Toll Road Commission and prohibitive legislation almost to have toll roads. There are circumstances, which is kind of understandable. But now, there is a lot of legislative activity in Arkansas.

Senator Malone, Senator Fitch, up here, along with many others up here, they passed a resolution asking the Highway Commission to engage in this subject.

There is a lot of interest in it. It is not only in Northwest Arkansas, it is all over the state.

I think the interest would be translated in we have to turn over every rock in Arkansas. We have got to make our resources expand as far as we can and in as many areas as we can, in order to do that, and we are looking at that very seriously right now.

Mr. Hammerschmidt. Thank you very much. We appreciate your testimony and your responses.

Mr. Roe. Mr. Chairman?

The Chairman. Mr. Roe?

Mr. Roe. I have got fifty million questions to ask. I look like I'm a quiet person, but I wanted to listen, and I feel a little bit like the skunk at the garden party, at the moment.

Number one, New Jersey is also a donor state, and I can share with you the feeling of seven and a half million people in the State of New Jersey when we built the Tombigbee program and rebuilt the water resources and so forth in the south, and we are a donor state too, so I think we have to take the donor issue and put it into perspective, as to the infrastructure like in the capital improvements industry as we do in our state too.

However, I would be concerned, and I'm concerned in listening to you today, about a system of national significance. What does that mean, and I assure you as a Member of this committee, I am going to look into that very very carefully, because New Jersey, to me, is in the system of significant—what would you say—the system of national significant need—if I'm making my point clear, okay?

There is one thing missing that bothers the living hell out of me—if you will pardon my language—is that we spend the time talking about how we are going to spend money, what we are going to do to raise money. There were some comments made and I think they were properly made and I think Mr. Young made the point at the tail end of your statement, when you came back and said, "If we are going to deal in a global economy.." which we are clearly in now, the assumption that it is just the United States and our marketplace here now, would be the most shallow thinking we could have. We are already in an international global economy, and it seems to me that we ought to be able to add a dimension to the research work we're doing. You mentioned research and what we are going to be doing here, from the point of view of evaluating for every dollar that we spend, what do we get in return?

Nobody speaks to that issue. They use the nebulous term called "productivity." I don't know what "productivity" means, and I don't think I am, uneducated, because everybody has a different definition for the word "productivity."

But one thing is for sure, one thing is an absolute positive fact—I mean the analogy I gave this morning about the George Washington bridge, one of the seven engineering, or just say, wonders of the world, if you like—but we have paid for it 50 times over, because we created it in the first place.

So it seems to me as we talk about national policy, and we are looking to how we resolve it starting here in Arkansas, we ought to add that for every dollar we spend, what does it mean in economic gain to the country, so that we are not talking about spending money, but what we're saying is, if we invest a billion dollars, we are going to get two and a half billion in return, and that is where the criteria ought to be evaluated.

That is my opening speech for the new seat that is going to come up here.

But I do think when we evaluate it, and John Paul and I have talked about it, and Glenn and I have talked about it, and while I have got the Floor, if my colleagues will indulge me one more minute, I happen to believe that science, space technology, and education, is the foundation of the future of the new wealth to be created in this country. That is where it is going to come from.

And the second point, one comes back and says, if we are going to compete globally, then we ought to be making the investment, we ought to be establishing a policy in transportation, in all intermodal relationships of transportation, as to how does it affect that economic aspect of it. How do we compete internationally, how do we get our products to market at the least possible cost.

The reason the Soviet Union is having such a terrible time right now—or for 10,000 reasons—they have no distribution system.

So, I would hope that when the committee looks into the issue of systems of national significance, what might be nationally significant in X state or Y state may not be in another, and I would hope that we would establish a policy that has a broader relationship of dollar expenditure, the money we are spending, if we get something in return.

We have got to tell the Congress of the United States, including the President of the United States, that when you are asking to spend the taxpayers money and we put the money into the Trust Fund, well, don't come up with a recommendation that shields the deficit and the budget, spend the damn money, because it is going to create new wealth, and Congress has to understand that, when they are balancing hopefully, or at least cutting the deficit by $50 billion. You don't throw away the baby with the bath water.

I thank you, Mr. Chairman, for indulging me.

Mr. **Pritchett**. May I respond briefly?

The **Chairman**. Mr. Pritchett.

Mr. **Pritchett**. In Arkansas, in the last two to three years, we have looked more at this cost benefit analysis than I think we have in the past.

We are hampered on doing this with federal funds, because the criteria that is set is pretty much transportation criteria—safety—but we have tried to look past that locally in Arkansas, and our planning and development districts in the state have run a cost benefit analysis for improving the infrastructure—primarily highways and bridges—but the infrastructure, as a whole.

Of course, you know, a lot of people take issue with these cost benefit studies, but I just don't—in real life, I am a country CPA, and I know a little bit about numbers, and I judge them to be realistic.

It does—I share your concern—It does produce some enormous rewards. Unfortunately, in state policy, most of the rewards are talked about in terms of general revenues and not designated fuel tax revenues. It is almost like we've used fuel taxes to do something that is going to provide a whole lot more sales taxes and income taxes, and that's great, I mean, it goes for education and human services and things like that, but it doesn't build any roads.

Mr. MINETA. Will the gentleman yield on that point. I would like to follow up on that.

When you talk about cost benefit standards, from your perspective, the State Highway Commission, the State Department of Transportation, do you think that federal requirements are too design specific and should we instead maybe reduce those design specifications and go to performance standards instead? So, we're saying, we don't care how you build it, but these are our standards, we want this road to last 20 years, we want the bridge to, whatever again the standard is.

Are we saying, you know, in our specs, are we saying the pavement has to be 13 inches and the subsurface has to be eight feet and whatever it is, and are we being too design specific and killing the cost benefit ratio that might otherwise come about?

Mr. SMITH. I think you possibly are, because you know, there are different soil types, and different terrains all over this state, and the design criteria in one part of the state should be different. There should be some latitude in there to allow us to change it.

Mr. MINETA. Also, with the budget summiteer's meeting at Andrew's Air Force Base, and the President has said, in effect, "We're going to lock you up and you stay there until the smoke comes out from under the door and we see what kind of an agreement you have on the budget," my fear is that we may not end up with, on the revenue side, a lot of different taxes that they may be talking about, but we may get some broad based approaches in terms of revenues. Things like a surcharge on personal and corporate income tax, or one that keeps looming is the gasoline tax, and I'm afraid that the gasoline tax may be one of the top items.

We also have under the leadership of Chairman Anderson and Congressman John Paul Hammerschmidt, a House Resolution that says we don't want the gasoline tax to be used for deficit reduction, as laudable a goal as that may be.

I am wondering if this kind of pitch comes up in terms of a gasoline tax, with—and we will get a crumb out of it, they will throw some little bit of it towards infrastructure, but I would imagine a vast majority of it will go towards, "deficit reduction."

I wonder what kind of a reaction I might get from the panel if that were to be the case?

Mr. PRITCHETT. We are not for it.

Mr. SMITH. We don't want it.

Mr. PRITCHETT. Us three are not for it.

Mr. SMITH. We don't want any crumbs and I'll tell you something else——

Mr. MINETA. That dog won't hunt?

Mr. SMITH. If that happens, it is also going to curtail our opportunity and our ability to pass any local gas tax.

Mr. MINETA. Well, I'll tell you what. Then I would like to ask that you start writing your letters to the White House right now, as well as to the leadership of the House and Senate, because I really see this as a possibility in terms of those discussions that are going on right now with the budget summiteers.

Mr. HAMMERSCHMIDT. Will the gentleman yield?

Mr. MINETA. Absolutely.

Mr. HAMMERSCHMIDT. You know, in the hearings last week in Tulsa, we had the State Highway Commissioner, the State Highway Director, we had Mr. Buren in Missouri, the State Highway Director, and they had the same position you do.

We asked them to please be in touch with the White House and with anybody else they had with influence in the Executive Branch in Washington.

Mr. MINETA. I think there is going to be some component of something that might be referred to as an energy tax. It could be a gasoline tax, because it is broad based, and increasing the tax leverages on consumption, and we don't want dependence on foreign sources in terms of our oil. On the other hand, if it goes to an import fee, it will affect the Northeast in terms of home fuel heating.

But it seems to me that they are going to take a look at some sort of a broad based tax to apply to everybody, and it seems to me, again, that an energy or an oil import, or a gasoline tax, something of this kind of tax, may be the very thing that may be a component of a few. There won't be a long list of excise taxes for cigarettes, and for wine and beer, and all this kind of thing, but I think it will be much broader than that.

So, again, I am very very fearful, even with the leadership of Congressman Anderson, and Mr. Hammerschmidt, and I believe we have what, about 280 co-sponsors on that?

The CHAIRMAN. We have 250 co-sponsors that I know of.

Mr. MINETA. 250 co-sponsors.

The CHAIRMAN. That's over 50 percent of the House.

Mr. PRITCHETT. Were all of them from Arkansas, a co-sponsor of that?

Mr. MINETA. I believe, yes, probably.

Mr. PRITCHETT. We could have fertilizer thinking a little bit on that.

Mr. MINETA. Fertilize, Mr. Pritchett. Thank you, sir.

The CHAIRMAN. Any further questions? If not, thank you very much, gentlemen.

Now, our next panel of witnesses will be addressing the water resources issues, and they are Mr. Richard Starr, the Engineer Manager of the Beaver Water District; Mr. Randy Young, the Executive Director of the Arkansas Soil and Water Resources Commission; Mr. Jerry Mitchell, the Area Conservationist of the U.S. Soil Conservation Service; and Brigadier General Stanley Genega, Division Engineers, Southwest Division of the U.S. Corps of Engineers.

I am going to suggest that we start with Mr. Starr.

Let me remind the entire panel that because of time constraints, we must ask each of you to hopefully hold your oral presentations to roughly three minutes each.

Your prepared statements, of course, will be published in their entirety, so if you have a longer statement, it will be in the record, but try to hold it as close as you can to that area.

Mr. Starr, you are first.

TESTIMONY OF RICHARD STARR, ENGINEER MANAGER, BEAVER WATER DISTRICT

Mr. STARR. Chairman Anderson, Congressman Hammerschmidt, and Members of the committee, we appreciate very much the opportunity for the Beaver Water District to discuss the water needs in Northwest Arkansas.

It was kind of interesting when I heard Mr. Hunt say he had over 4000 trucks, because yesterday, the Beaver Water District produced enough pure water to fill those trucks up for him.

Beaver Water District is a non-profit revenue funded regional water district providing potable municipal and industrial water to over 125,000 people, and the largest concentration of food processing industries in Arkansas.

The District was formed in 1959, and purchased all of the municipal and industrial water in Beaver Reservoir.

Working with the Corps of Engineers as a partner, we have developed an outstanding water resource into the only permanent long term water supply in this area.

Through sound planning and cooperation, we have a high quality of raw water source adequate until the middle of the Twenty-First Century. Thanks to this area's farsighted planning, we now have the necessary raw water infrastructure in place.

Now, we need to do two things to meet the growing water needs of this region. The first is to build in a timely manner the treatment facilities, the transmission lines, and storage tanks to meet the peak demand of our water users.

The second is to protect the water in Beaver Reservoir so that it remains a high quality raw water source. This second task will be difficult because of the lack of high priority for the protection of drinking water sources among the various competing interests and governmental agencies.

To accomplish these tasks, we need your help and support in the following areas.

We need to recognize that we need long range policies that recognize the importance of high quality raw water sources, and stop using these select waters as conduits for treated and untreated waste.

We need to encourage and fund programs that reduce or prevent the impact of non-point sources of pollution located in the watersheds of these select raw water sources. We need policies and funding that encourage the regionalization of water supply systems both in facilities and in operations. We need revisions to the 1986 tax law to remove the provisions which have caused hardships on the funding for capital improvements using tax exempt municipal bonds.

Above all, we need to realize that we have limited available resources to rebuild and expand our infrastructures.

Therefore, it becomes imperative that all federal, state, and local parties, cooperate to ensure that we get the most positive return for each unit of resources committed.

An adequate supply of pure drinking water for home and industry is necessary for this or any other area to grow and prosper. It is one of the very basic foundation blocks of our infrastructure. We need to invest a part of this nation's resources to fill this need. This task will be much easier and require fewer resources if we deal with it before it becomes a crisis.

Thank you.

[The prepared statement of Mr. Starr appears on p. 1755.]

The CHAIRMAN. Mr. Young.

TESTIMONY OF J. RANDY YOUNG, EXECUTIVE DIRECTOR, ARKANSAS SOIL AND WATER RESOURCES COMMISSION

Mr. YOUNG. Thank you, Mr. Chairman, Congressman Hammerschmidt, and Members of the committee.

My name is Randy Young, and I am the Director of the Arkansas Soil and Water Conservation Commission, as well as a member of our Arkansas Pollution Control and Ecology Commission.

I have submitted written testimony, and I will try to stick to your timeframe and make a few of the points that are addressed in more detail in my written testimony with respect to water quality, which is not traditionally considered within the definition of infrastructure. I will also talk briefly about our overall infrastructure needs in the area of municipal and domestic water supply, waste water treatment, and sod waste disposal.

First a couple of points with respect to water quality, and following on some of the points that Mr. Starr made with respect to addressing non-point water quality problems. In Arkansas, we are beginning to address non-point water quality problems here in Northwest Arkansas as a priority, in order to protect the quality of the water that is available in the tremendous asset that we have in the Beaver Reservoir.

There are a couple of things that I would encourage your committee to look at that would help us as we proceed to do that.

One is to increase the availability of cost share assistance in order to help our landowners install the best management practices that are going to be necessary in order to protect the quality of the water in our surface water system.

In the second area, presently the cost share requirement under the 319 Program, is a 60/40 federal-state. For poor states such as our's, that is a tremendous hardship in terms of our ability to provide the 40 percent match, and I would ask that you consider increasing that match to a 75/25 federal-state.

A couple of other areas where we are involved in addressing non-point water quality problems, working with the Corps to implement the Beaver water quality demonstration project. I would encourage Congress to continue funding that demonstration effort to the full capability that we have set forth in the plan of work that was developed jointly by the federal and state and Local interests.

Thirdly in the area of non-point, we have two significant cooperative programs underway with the U.S. Geological Survey in which we are identifying the potential for ground water contamination in Northwest Arkansas, and I would encourage the Congress to continue adequate funding for the USGS co-op program.

I know sequestration has been a concern of our's in the past with regard to that program, because when federal funds are sequestered, our state match funds are also sequestered, and that is a concern to us, and I would ask that you take a look at that.

Moving on to the more traditional infrastructure needs and particularly with respect to water supply. We still have over 400,000 Arkansans that are not served by a public water supply system in the State of Arkansas.

The Director of our State Health Department, Dr. Joycelyn Elders has stated that one of the most important things that the Arkansas Department of Health can do to improve the public health, is to ensure the availability of a clean safe public water supply for people.

We have estimated a need of approximately—well, there is approximately $93 million in application pending before FHA, at this point in Arkansas.

With the current levels of funding available through the various federal programs and through our state programs, we can meet less than half of that need.

With respect to waste water treatment, and I will stop with that, we have 146 communities throughout the state in which their NPDES permits, their waste water discharge permits, have expired and must be renewed, which is going to require a significant improvement into their treatment scheme, in order to get those permits renewed. Thirty-five of those permits are in Northwest Arkansas.

As you all know, the EPA Construction Grants Program has been phased out into a state revolving loan fund. This is resulting in our average sewer bills going from $20.00 under the old construction grant approach, to approximately $37.00 with the present mechanisms available to finance these improvements, and that is a combination of revenue bonds, the state revolving loan program, and a state general obligation bond program that our people approved in the last general election. So, the result is going to be essentially about a doubling of our sewer rates, in order to be able to make the improvements necessary under the existing system of financing.

The need has been identified statewide to be in excess of $500 million.

With that, Mr. Chairman, I would close, and if there are questions later, I would be happy to respond.

[The prepared statement of Mr. Young appears on p. 1835.]

The **Chairman.** Thank you, Randy, very much.

Our next witness is Mr. Jerry Mitchell of the U.S. Soil Conservation Service.

TESTIMONY OF JERRY MITCHELL, SOIL CONSERVATION SERVICE

Mr. **Mitchell.** Thank you, Mr. Chairman, Congressman Hammerschmidt, Members of the committee, and other distinguished guests.

I am pleased to have the opportunity to testify before your committee today on the water resource concerns here in Northwest Arkansas.

As you have heard other panelists and other people say this morning, this area is a rapidly expanding area. It is expanding more rapidly probably than any other area in Arkansas, and a lot of this growth can be contributed, as you heard Mr. Tyson say this morning, to the livestock and the poultry industry.

What we are seeing here with this great boom that we are having in the livestock and poultry industry, we are also seeing some environmental concerns come up.

What we have tried to do is try to reach some kind of compromise between the environmental concerns as well as the economic growth.

Arkansas ranks near the top in broiler chicken production and it also ranks in the top 20 of swine, turkeys, eggs, and beef production. The majority of these operations are located in Northwest Arkansas.

Again, while this provides great economic development opportunities for the state, for this region as a whole, we would like to in some way, maintain some kind of stability of this region, where we can ensure the growth that we are seeing in the area's industrial base, as well as keep the local agriculture producers in business and strive to achieve some kind of environmental balance where that our high water quality that we have in this area, is not compromised.

There are several sources of contamination as you heard Mr. Starr say earlier, and what we are concerned with in the USDA arm of the Soil Conservation Service, is primarily the non-point source problems that we are seeing from the combined operation of the different operations that we have in this area here.

When we are talking about the problems that we are seeing, they are very pervasive.

Much of the drinking water that we get in Northwest Arkansas comes from the White River or the lakes along it. We also get drinking water out of the Illinois River, and the runoff from the fields where we apply our litter from the animal operations, is also the same water that recharges part of our ground water which is also used for drinking water supplies.

What we have tried to do here in Northwest Arkansas is come up with a combined federal-state and local effort. We have had the involvement of the Corps of Engineers, the Environmental Protection Agency, the USDA agencies such as the Soil Conservation Service, the Agricultural Stabilization and Conservation Service, the Extension Service, as well as the state agencies such as Mr. Young's agency, and the people here at the University of Arkansas who have been doing some research efforts.

We have all joined together to try to put forth programs that Congress has given to us, and the farmers have been most receptive to these programs.

What we have seen with the USDA programs that we have recently had on a cost-share basis, we have seen about 600 different farmers that have applied for practices up here that will help control this non-point effort.

We have also had a demonstration project that we are running in conjunction with the Corps of Engineers, and the Environmental Protection Agency, and we are hoping that this will be getting underway very shortly, but we also see this as an effort to reduce some of the nutrients that are getting into our drinking water supplies.

We don't want to forget, as we are trying to control the environmental concerns, we don't want to overlook the economic stability of the region, and what we have seen here in Arkansas, we see about $2.6 billion that the agriculture, poultry, and livestock industry has pumped into our economy, and again, the bulk of that, or a lot of it, is coming from right here in the surrounding Northwest Arkansas region.

We have the number one and number two agriculture counties here in Northwest Arkansas, and again, most of the money that comes in, is coming in from the livestock and poultry interests.

I want to thank you for letting me offer testimony to you, and if there are any questions, I will be happy to answer them.

[The prepared statement of Mr. Mitchell appears on p. 1715.]

The CHAIRMAN. Thank you, Mr. Mitchell. We will get to the questions a little bit later.

Our next witness is General Genega of the United States Corps of Engineers.

General.

TESTIMONY OF BRIG. GEN. STANLEY G. GENEGA, DIVISION COMMANDER, U.S. ARMY CORPS OF ENGINEERS

General GENEGA. Mr. Chairman, Members of the committee, I am pleased and it is an honor to be here today to represent the Southwestern Division of the U.S. Army Corps of Engineers, to participate in this panel to discuss the Corps' interest in our nation's infrastructure, pursuant to our Civil Works mission.

I would like to talk about two things. First of all, the Corps' role, as we see it, in helping to solve our nation's infrastructure problems, and then some of the ongoing activities of the Southwestern Division, particularly in this part of Northwestern Arkansas.

As you know, we in the Corps have a long history of developing both water resource and military infrastructure. We are concerned not only about that infrastructure that we have developed, but the remaining infrastructure of the nation.

We believe that we not only need to be efficient and effective in administering the existing programs, but we need to establish new and creative approaches for partnerships between federal, state, and local governments, and the private sector, to solve these problems.

In keeping with this philosophy, the Assistant Secretary of the Army for Civil Works, Mr. Robert W. Page, has stressed some new initiatives with the private sector to attempt to work at solutions for this problem.

Additionally, our Headquarters of the Army Corps of Engineers has also worked a number of initiatives looking at developing that broad federal strategy that I heard mentioned here earlier—that is, playing our role in the development of that broad federal strategy.

Let me now mention just a few of the water resource infrastructure problems and opportunities in Northwestern Arkansas.

One of the major infrastructure projects over which we have jurisdiction, of course, is the McClellan-Kerr Arkansas River Navigation Project. High water flows in the last several years have restricted traffic, but the biggest problem that we have faced is the annual problem at the White River entrance channel.

This is the first reach of the McClellan-Kerr, and the water surface is controlled not by a dam, but by the water level of the Mississippi River.

The Little Rock District is conducting feasibility type studies to find a solution to that annually worsening low water problem. We expect in the near future to recommend a lock and dam at Montgomery Point.

Another example of important Arkansas infrastructure is Beaver Lake, which you heard mentioned by several of the speakers who preceded me, and in recent years, water quality has become a problem due to high nutrient contents.

In Public Law 101-101, Congress has appropriated funds for this project, and directed that the Corps of Engineers implement solutions to fix the problem.

We are scheduled to begin, in coordination with state and local officials, and the Department of Agriculture, in February of 1991.

With regard to the Arkansas River Basin levees, in spite of their age, they stood up quite well in recent flooding. Our recently study, however, does point out that local officials need to rehabilitate and repair them to ensure their continued proper functioning in the future.

We additionally in this area have the responsibility for some seven hydropower plants, which continue to provide safe and efficient hydropower to the economy of this area.

In summary, we have not solved all the water resource problems in Arkansas or the Southwestern Division, but we are continuing to work them. The spring floods of the last couple of years have demonstrated only too clearly that, for example, in the flood control area, with our dams and levees operating as they were designed, we must continue to look at the needs and justification for other water resource projects.

Mr. Chairman, it has been a privilege to testify in front of the committee. I would be pleased to address any questions you or any Members may have.

[The prepared statement of General Genega appears on p. 1679.]

The CHAIRMAN. Thank you, General, and thank you, panel, for your fine statements.

I will start off with my first question.

How would a better infrastructure, whether it be ports or other waterway facilities, how would that result in a stronger economy for this area, and could you give some specific examples?

Mr. Young?

Mr. YOUNG. Well, I think first we can look at what we have already in place in Northwest Arkansas, and we can attribute a significant part of the economic development that has occurred here, to the fact that we have got the surface water resource in Beaver Lake that we have here, which is the regional water supply for all of Northwest Arkansas.

I guarantee you, without that, we would not have the economic development that has occurred in this area, that we see.

So, I think that is the best example that anyone could cite to respond to that question, just look at what has occurred with that.

The **CHAIRMAN**. Any other comment? Mr. Starr?

Mr. **STARR**. Yes. One of the things that we find in this particular area, is that all of our water systems, by and large, are revenue operated. We pay as you go, and do not collect ad valorem taxes. So, as we develop these resources and utilize them efficiently, we make our industries much more cost effective.

An average poultry plant will use a million gallons of water a day, and that water is one of their cost factors that they have to have in their mix, when they price that bird out.

So, the benefit of having a water supply that is cost effective, is translated into profits, which in turn, turns into jobs, growth, and taxes for the nation.

The **CHAIRMAN**. Mr. Mitchell?

Mr. **MITCHELL**. I'm sorry, Mr. Chairman, I'm lost on your question here. I was trying to get the answer.

The **CHAIRMAN**. I was just wondering, you know, you are the water experts, on how would a better infrastructure such as ports, waterways—anything related to water—why would it result in a stronger economy for this area.

Mr. **MITCHELL**. Okay. If I could then, I would like to provide you with an answer.

The **CHAIRMAN**. Sure.

Mr. **MITCHELL**. As Mr. Starr said, what we have seen here is an expansion of the poultry industry, besides the different—J.B. Hunt, Wal-Mart, whatever—and with this, we are highly dependent upon our surface waters to provide us good safe clean drinking water, and along with that, we are also dependent upon the programs that your group administers in the Clean Lakes Act—or under the Clean Water Act, such as the Clean Lakes Program, and the 319 Program that the EPA has, as well as the Water Resource Act that applies to the Corps of Engineers.

These things are very important to us here. They are vehicles whereby we can receive different help for our people here in Northwest Arkansas, as our area expands and we have problems or issues that come up, this is a way that we can address those.

The **CHAIRMAN**. Any other questions?

Mr. **HAMMERSCHMIDT**. Mr. Chairman, I know in 1986 and 1987, I guess, in the Water Resource Development Act, we authorized several million dollars to study this problem, and subsequently there was a $2 million authorization, and the Corps of Engineers took that $2 million and performed a study on best management practices.

In conjunction with the Soil Conservation Service, and then monitored by EPA, I guess, that is now underway, and you have a draft plan that is getting ready to be implemented, I assume.

Is that not true?

The **CHAIRMAN**. Yes.

General **GENEGA**. That's correct.

The **Chairman**. Well, I'm delighted that we are moving forward on that. I don't want to get too deep into that, because we have another panel, and time is running out on us.

Mr. Starr, is really the on the scene, hands-on expert, in the Beaver Water District, and this whole area. I have discussed with some of my colleagues, particularly Chairman Roe, who has been a great water legislator for many years, about our distress over that 10th Circuit Court decision on the Fayetteville Water District, and he was sort of nonplused and amazed as I was—and I am not going to express my position, because you know what it is—but I might yield to Mr. Roe, and he might want to just ask you some questions about it.

Mr. **Roe**. That's what you call leading the witness.

Mr. **Hammerschmidt**. That's right.

Mr. **Roe**. Well, the only thing, I did read the background of the case, and it is a very unique case that has come out of the Courts now. In fact of the matter, it creates all new law, and unless that particular case is litigated further, I mean you really come up to a no discharge policy, and that was never the intent of the late legislation as it was written. I can tell you that flat out.

So, as John Paul has explained, we will get into that, and will probably have to look maybe for a legislative decision on it, or a solution to it, because otherwise, as far as your water supply is concerned, at least as far as what is it—the——

Mr. **Hammerschmidt**. Yes, it's a split flow.

Mr. **Roe**. It's a split flow system. You are half out of business, is what it amounts to. So, we are going to look at that. That case has national import, and we will take a look at that, as John Paul has asked us to do, and see what kind of a solution we can come up with.

Mr. **Starr**. We very much appreciate that, because we agree with your position that that is a very significant case with nationwide significance. I hope that we can find a solution and a way to keep everybody comfortable.

Mr. **Roe**. Of course, if we go ahead on a state level, go ahead and declare that that poke in the river that goes into the other state as, what would you say, wild rivers, and make it even, if you like. That's not—it would help some.

The **Chairman**. Mr. Inhofe?

Mr. **Inhofe**. Yes, Mr. Chairman, just a brief comment in observation to General Genega and so many of the things he brought up, and I have talked to Congressman Hammerschmidt many many times about this.

It affects our Districts almost equally, and I think when we look at such things as the antiquated Arkansas levee system, where in some areas it is holding up better than in other areas, and it goes beyond just a local concern, and certainly with the tremendous investment in the Kerr-McClellan Waterway, the Montgomery Point Lock and Dam is—I look upon that as a national issue as opposed to a local issue.

It is absolutely necessary to keep it alive and to protect that investment from my District as well as from Congressman Hammerschmidt's District.

General **Genega**. Yes, sir, I would agree with that.

The **Chairman**. Any further questions? If not, thank you very very much.

Now, this brings us up to our final panel of witnesses, and they are local officials. They are the Honorable Charles McKinney, Mayor of Springdale; the Honorable John Sampier, Mayor of Rogers; the Honorable Jerry Montgomery, Mayor of Mena; Mr. Strib Boynton, the City Administrator of Fort Smith; the Honorable Charles Johnson, Washington County Judge; and the Honorable Bruce Rutherford, Benton County Judge.

Mr. **Hammerschmidt**. And Mr. Chairman, Mr. Fred Vorsanger, the Deputy Mayor of Fayetteville, since the Mayor isn't here, would he kindly join the panel for his statement, please?

The **Chairman**. Fred Vorsanger will be added to the panel.

I want to welcome all of you. Mayor McKinney, we will start with you.

TESTIMONY OF HON. CHARLES N. McKINNEY, MAYOR, SPRINGDALE, AR

Mr. **McKinney**. Thank you, Mr. Chairman. I would first like to say, and I will keep my remarks brief, how much we appreciate the work that John Paul Hammerschmidt does, not only for the State of Arkansas, but for this particular area.

To give you a quick overview of Springdale, preliminary census figures show that from 1980 to 1990, we had a 28 percent increase in our population. Our unemployment rate is in the 3 to 4 percent range.

We have a highly diversified industrial base in spite of inadequate roads and highways. We have an abundance of water from Beaver Lake, and we have just completed upgrading our waste water disposal facilities.

I would emphasize that if we are to continue to grow and prosper, the completion of Highway 71 from I–40 to the Missouri line is a must. It is just as important as the improvement of Highway 412 from Springdale to the Oklahoma line.

Air transportation has improved over the years in this area, but a regional airport is certainly needed. Local airports would continue to provide local service for industry. The installation of radar in this area, should be a priority.

I have much concern that oftentimes regulations do not seem to follow the intent of legislation and I go back to the water discharge that was mentioned awhile ago.

Northwest Arkansas is the unique position due to the fact that we are in headwaters and we don't have any big flowing streams to release our waste water in, and this adds to the cost, and to the economy of our citizens.

Very quickly, I have one other thing that I would mention, and I'm sure this is a problem for all of us, and I'm sure that you have a concern about it, and that is programs that are mandated without proper funding, and I call to your attention, the Clean Water Act. We are all for the environment, but as it pertains to storm water treatment, and this is going to face all of us, and since we are in this unique position that apparently without additional legislation we can't discharge anymore, and if we have to start treating storm water, we're in a world of hurt.

Solid waste disposal hasn't been mentioned, but is should be, because once again, it is the key to our industrial development.

I want to thank the committee, the Chairman, and John Paul for your consideration.

[The prepared statement of Mr. McKinney appears on p. 1714.]

The **Chairman**. Thank you very much. Mayor Vorsanger?

TESTIMONY OF HON. FRED VORSANGER, VICE MAYOR, FAYETTEVILLE, AR

Mr. **Vorsanger**. Thank you very much. I have a lengthy statement here which I will not read. I will read two paragraphs to keep it within two minutes.

The **Chairman**. It will all be in the record, the entire statement.

Mr. **Vorsanger**. Thank you.

The City of Fayetteville is one of the fastest growing cities in Arkansas. We are the largest city in Washington and in Benton County.

We are the home of the University of Arkansas. We have been dealing with unbelievable growth.

We have all the problems that you have heard today and more so.

The City of Fayetteville has approached federal regulations with cooperation, dedication, and enthusiasm. The continued rise of a host of federal regulatory programs aimed at environmental protection, along with a decrease in funding provided to the city, is continuing to put a strain on our future funding programs.

Therefore, many infrastructure improvements within our beautiful city will only be a dream.

I want to remind the panel that just recently Money magazine named Fayetteville, Arkansas, as the seventeenth best livable city in America.

If our community is to continue on the road to economic success, improved highways, larger airports, increased water capacity, and many other improvements, your help is increasingly important. We need the Federal Government's help now more than ever before, and if we are to continue to improve our quality of life—and I want to tell you that I'm a first generation American, and the American dream is alive in this community—we need your help, and I hope we will get it.

Thank you very much.

[The prepared statement of Mr. Vorsanger appears on p. 1767.]

Mr. **Hammerschmidt**. Mr. Chairman, before you call the next witness.

Fred, let me thank you, and I noticed this very interesting book, A Community Profile, and we will attach that also with the record.

Mr. **Vorsanger**. Yes, I gave you that so you could attach it to the hearing record. Thank you.

The **Chairman**. Mayor Sampier.

TESTIMONY OF HON. JOHN W. SAMPIER, JR., MAYOR, ROGERS, AR

Mr. **Sampier**. You got closer than most do at their first try. Sampier. Thank you, Mr. Chairman, Congressman Hammerschmidt, and Members of the committee.

Obviously, at this point in the testimony, many of the things that I would mention would be redundant, but I hope you would bear with me for a few comments, because I hope that it shows that since we all prepared our remarks separately, that it shows some continuity of what the public and the private sector see is necessary for our area.

The City of Rogers is the twelfth largest city in Arkansas with a population of some 25,000. Rogers has experienced a 39 percent increase in population growth since 1980, the largest increase of any city in Northwest Arkansas.

This phenomenal growth is due to the quality of life, plus the beauty of the area. Very importantly, that two Federal projects contribute to that—the impoundment of the White River for Beaver Lake under the able direction and management of the U.S. Army Corps of Engineers, and one of Congressman Hammerschmidt's crowing achievements, the Buffalo National River.

We also couple this with a diverse economy. Our economy is based on industries, tourism, retirees which makes up over 17 percent of our population, and agriculture.

Industrial expansions, or new industries, have invested over $332 million over the last three years, with an increase of over 2,400 jobs in Rogers alone. The unemployment rate ranges from 3 to 3.8 percent.

Our infrastructure problems center around providing adequate services for one of the most rapidly growing areas of the nation.

Our most pressing needs concern an inadequate highway and road system to keep pace with this growth. One intersection in Rogers has the highest traffic count in Arkansas, outside the metropolitan Little Rock area.

Our highest priority need is direct access to four lane interstate standard highways. We must have rapid interregional, interstate, and intrastate move of our commerce, if we are to continue to flourish and be competitive.

Most importantly, the safety of the motoring public is at stake. The sobering injury and death statistics on Highway 71 and Highway 412 are a disgrace.

The completion of U.S. Highway 71 to interstate standards from Alma, Arkansas, to the Missouri line, will give us badly needed access to our markets, and our State Capitol in Little Rock.

We are continually at a disadvantage in interacting with the seat of government in our capitol city, because of the arduous and dangerous travel required on the antiquated two lane highway through the Boston Mountains.

This link with the envisioned Interstate 49 from Shreveport, Louisiana, to Kansas City, Missouri, is of national significance, considering a north-south link from the Great Lakes to the Gulf of Mexico.

It is also imperative to realize our potential with Tulsa, Oklahoma, and Northeast Oklahoma, by the joining of the Cherokee Turnpike with a four lane U.S. 412. The significance of this project is greatly increased when one realizes the intermodal connection with the Port of Catoosa and Tulsa International Airport.

Only these two four lane projects of national significance will address the current deplorable conditions of motoring safety and highway congestion in Northwest Arkansas. Correspondingly, in meeting these critical human needs, adequate rural access will be achieved as well as finally providing decent commercial access to the rest of the state and the nation.

Coupled with adequate streets and highways is adequate management of drainage. An engineering estimate in 1978 pointed out it would take $4.2 million just to correct the drainage problems in Rogers, at that time.

We would respectfully request an increased national role in helping to meet these inner city drainage and flooding problems, such as with the able assistance of the U.S. Army Corps of Engineers.

The 1986 amendments to the Safe Drinking Water Act, as well as the mandates of the Clean Water Act, are prudent national goals as outlined by Congress. However, we respectfully suggest an increased role of congressional oversight in the development of agency guidelines to meet these goals. Common sense and an understanding of our severely limited local resources to meet these mandates is badly needed.

We simply do not have the local resources to meet ever increasing Federal mandates in so many areas, and at the same time, provide adequate roads, fire protection, police protection, and other basic services, without help. The mandates proliferate without commensurate assistance to meet those mandates.

We are proud of several local and regional partnerships that have allowed us to jointly meet some national mandates, but we must have a renewed partnership from the Federal level, if we are to survive.

We recognize and are grateful for these national hearings of the Committee on Public Works and Transportation to form a foundation whereby together we can rebuild our cities for our children and our future.

Thank you.

[The prepared statement of Mr. Sampier may be found on p. 1751.]

The **Chairman**. Mayor Montgomery.

TESTIMONY OF HON. JERRY MONTGOMERY, MAYOR, MENA, AR.

Mr. **Montgomery**. Mr. Chairman and Members of the committee. I am Jerry Montgomery, Mayor of the City of Mena.

Mena is located in west central Arkansas, having a population of 5,500 with an estimated trade area of 25,000. Mena is one of the growing cities of west central Arkansas, as shown by the recently released preliminary census figures. Mena has grown by approximately 6 percent since 1980.

Even though we are located 80 miles from the nearest interstate or improved four lane highway, the western side of Arkansas was excluded in the development of a four lane interstate, and this had

had an adverse affect on our industrial growth, because of an inadequate transportation system through our region of the state.

We strongly support the extension of Interstate 49 which is proposed from Shreveport to Kansas City. The construction of this interstate will provide 11 mid-American states with a quality highway from the Gulf of Mexico to the Canadian border.

Studies have shown that the 11 states this highway will serve, comprise over 22 percent of the nation's population, and this highway will fill a 500 mile void between Interstate 35 and Interstate 55 for north-south highway transportation.

We feel that it is imperative that the Federal Highway Trust Fund be kept intact and urge that they be used for such highway improvements as Interstate 49 or an improved U.S. Highway 71.

In our area of the state, tourism, which affects our local economy by creating thousands of jobs, is highly dependent upon quality highways, not to forget the transportation needs of such companies as Wal-Mart, J.B. Hunt, and Tyson Foods.

Mena's airport is among the busiest airports in the State of Arkansas, not in passenger traffic, but in the service industry, as it relates to aircraft maintenance. We have a world wide reputation for quality and fast turn around in aircraft maintenance. The industries located on the airport employ just over 225 people with an annual payroll of approximately two and a half million dollars, having annual gross sales of $11 million, of which 3 million of this is in foreign sales.

However, we are in an extreme need of a new 6,000 foot east-west runway with an ILS system to accommodate not only the needs of the 12 existing companies, but the future needs of the two large aircraft industries interested in locating at our airport.

The economic development at the airport is limited by the lack of an adequate precision instrument runway. If built, in excess of 350 new jobs would be created, which would significantly improve the economies of not only Polk County, but the surrounding counties comprising approximately 50,000 population.

These new jobs, with related services, represent an economic impact of greater than $25 million annually. We are convinced, without current lack of close access to a four lane highway system, that we must further develop the airport in our region of the state, if we are to grow economically and provide the quality jobs for our young high school and college graduates, who now must leave our area to seek a better life.

Again, we implore the Congress to keep the Airport Trust Funds intact, and ask that these funds be used for such improvements as the needed expansion of airports for economic purposes.

With the assistance of the EDA and Farmers Home Administration, we recently completed a badly needed water system which saved approximately 250 jobs from being lost due to a lack of water.

Presently, many of our cities, Mena included, are in need of making improvements to their waste water and antiquated sewer systems to come into compliance with the Federal EPA regulations.

Many of us are currently under a Federal Administrative Order to clean them up. As we all know, this takes large sums of money. Mena, like many cities in Arkansas, has been willing to tax themselves with a one cent city sales tax to accomplish many of these needs without asking for any grant assistance from the Federal Government.

More recently, Mena and Polk County residents passed an additional county wide one cent sales tax with the bulk of the city's share of these funds to be used for water and sewer improvements. However, it will be necessary to utilize the low interest loans made available by Farmers Home for these projects, as well as grants that are currently available from state and federal sources.

Therefore, we would encourage that loan and grant funds continue to be made available for these necessary improvements, not only to help create new jobs, but to save existing jobs.

Finally, most every city in this region of the state is facing the real problem of solid waste disposal. Mena is currently shipping its waste, after recycling, to the nearest landfill located 80 miles away, at a tremendous cost to our citizens, and the expense is becoming more costly by the day.

We would respectfully ask that all consideration be given by the Congress to assist rural America in helping us in any way possible, to develop an acceptable environmentally safe solid waste program that we can afford.

I will sum up by saying that all existing federal funding for infrastructure programs must be kept intact. I sympathize with the plight of Congress in the reduction of the national debt, and agree with the Gramm-Rudman Act in enforcing a balanced budget, to include a strong military posture, which is essential for the protection of our country, but we, as Mayors, must continue to seek federal assistance for our local infrastructure needs.

In closing, I want to thank Congressman Hammerschmidt for the opportunity to appear before you and bringing you to this part of Arkansas, and hearing our needs.

Thank you.

[The prepared statement of Mr. Montgomery appears on p. 1725.]

The CHAIRMAN. Thank you, Mayor Montgomery.

Mr. Strib Boynton, City Administration, Fort Smith.

TESTIMONY OF STRIB BOYNTON, CITY ADMINISTRATOR, FORT SMITH, AR

Mr. BOYNTON. Mr. Chairman, Congressman Hammerschmidt and the other Members of the committee, I want to thank you for your interest in dealing with Northwest Arkansas' infrastructure needs.

Fort Smith is Arkansas' second largest city. We have a population, depending upon what the Census Bureau finally decides, of approximately 80,000 people.

I believe most communities to have the capacity to find solutions to their own problems, especially when federal, state and local officials are willing to work with the media, business, and citizen leaders to try to find a common solution for the common good of all.

In my written statement, you can see examples of where that has been successful in Fort Smith and in western Arkansas.

In particular, I think our new $37.5 million Lee Creek Water Supply Project, is a tangible example of what can happen. A tangible example of a regional solution to a problem when federal, state, and local officials are willing to work together.

In approximately 18 months, 130,000 people in western Arkansas and eastern Oklahoma, will enjoy a 50 percent increase in reliable, high quality, low cost drinking water.

Today I am tempted to simply ask you for money as many others have this morning, yet I believe there are also at least four specific things, four specific actions that Congress can take, to help Fort Smith and other cities, that will not require you to write a check.

First, and it was mentioned a moment ago, I think a clear and consistent national policy, along with significantly greater Congressional oversight, involving waste water and storm water management systems, would greatly help each of us better plan and manage our own sewer systems.

Many cities, including Fort Smith, have spent millions of local dollars in recent years, to develop and maintain separate wet weather and dry weather systems, as required by the Federal Government over the last 20 years.

In 1989, however, the Clean Water Act was amended to require that cities now address both wet weather and dry weather problems in their new NPDES permits. That reverses 20 years of national policy without any financial assistance, and that creates a staggering financial burden for our citizens and businesses, particularly in those cities that have already spent their limited local dollars to separate the systems.

Secondly, although many federal laws specifically set a 30 or a 60 day period in which to appeal a regulatory agency's decision to a Court, Section 404 of the Clean Water Act does not.

Having been through a very extensive licensing and permitting process on our Lee Creek Water Project with FERC and the Corps of Engineers, I believe a clear and expeditious appeal process, including a specific 30 or 60 day appeal deadline should be included in Section 404, in order to avoid potentially costly and unnecessary time delays in critically needed future water supply projects, and other projects, as well.

Third, while just about every community currently wants to recycle their way out of the solid waste mess, I suggest Congress can best help cities, by working with cities to develop national and international markets for recycled materials rather than mandating through the regulatory process, recycling as a solution.

I believe at least two bills have recently been introduced in Congress, to help develop markets for recyclable products, and I would encourage you to support such legislation that will help to develop such markets for recyclable products, if our recycling efforts are to be successful and meaningful.

Fourth, I also believe that Congress can help cities by supporting the various pieces of legislation that come before you from time to time, that will give us, as cities, much greater financial and regulatory flexibility, and also opposing the legislation that will come to you from time to time, that might tend to undercut our ability to solve our own problems.

I also believe that Congress can encourage, and should encourage, regional solutions to problems such as water, waste water treatment and solid waste.

In Fort Smith, being a border community, that means we may need your help in creating more flexible, as well as additional interstate compact commissions to solve such problems.

I would like to conclude this morning by thanking each of you, including Chairman Anderson, and Congressman Hammerschmidt, for caring about our needs.

While many of us would like, we need, and will ask you for money from time to time. But most importantly, I think we need your personal leadership in finding more flexible federal alternatives, and more creative regulatory solutions, as we attempt to solve our own problems.

Thank you.

[The prepared statement of Mr. Boynton appears on p. 1664.]

The CHAIRMAN. Thank you, Mr. Boynton.

Our next witness is the Honorable Charles Johnson, Washington County Judge.

TESTIMONY OF CHARLES A. JOHNSON, WASHINGTON COUNTY JUDGE, FAYETTEVILLE, AR

Mr. JOHNSON. Chairman Anderson, Congressman Hammerschmidt, and committee Members, I want to thank you for coming here to Northwest Arkansas, and allowing us to talk to you about our infrastructure needs.

Much has been said about the growth of the area and our economy, so I won't repeat all of that, but I will just say that Washington County, in the preliminary census figures, shows a population of 114,000, which places it second in the state in population. Washington County also ranks first in agriculture production, based on dollar value, of any county in the state, with Benton County ranking second. Washington County ranks forty-first nationally in the value of agricultural products.

I want to reiterate what previous speakers have said about the need to proceed as rapidly as possible with the four laning of Highway 71, developing north-south routes, and also with the improvements and a four lane interstate type highway east and west, connecting with the Cherokee Turnpike to the west, and extending east of here.

In addition to the interstate type routes, it is important not to overlook the need to maintain and upgrade our network of county roads and city streets, which provide access to the interstate routes.

A question was asked to the first panel, I believe, of what the counties and cities might be doing to assist in the development of improved vehicle traffic, and interstate development, and I will tell you this, that we are doing everything we can to look at our system of county roads, and to try to plan for the upgrading of routes that provide access to new interstate type highways.

Benton and Washington Counties rank first and second among the counties in the state in the number of miles of county roads. This fact alone presents us with a major challenge, but is compounded by major traffic consisting of feed trucks, milk trucks, live haul trucks, and logging trucks, the weight of which often approaches and may even exceed the 80,000 pound weight limits.

This requires that our roads and bridges be built to the highest standards in order to stand up to this kind of traffic.

Washington County has 644 structures or culverts, spanning water courses with 165 bridges of 20 feet in length or longer, 37 of which are either functionally obsolete, or structurally deficient, and in need of replacement.

As you can see, we face a continuing struggle to maintain and upgrade our system of local roads and bridges, even though we do everything possible to utilize methods and designs that will get the job done in the most cost effective manner.

Perhaps the infrastructure need we have, which could reach crisis proportions almost overnight, is our means to dispose of solid waste which is generated in this area.

Our scenic mountainous area has its problems when it comes to the disposal of solid waste. The soil types in the area and the fractured limestone formations underlying much of the area, make it difficult to site landfills which can be operated in a manner safe to the environment.

Municipal solid waste generated in the four county region, which includes Benton, Washington, Madison, and Carroll Counties, stands at 482 tons per day presently, and is projected to increase to 600 tons by the year 2000, and 670 tons per day by the year 2010.

Development of a solid waste management plan and projections are made more difficult, because of the limbo we are in awaiting the adoption of final EPA regulations.

Current permitted landfill capacity in the area is approximately two years. Plans for solid waste disposal, including maximum recycling and waste stream reduction is anticipated to be extremely cost and may only be accomplished after considerable effort and some local opposition.

Another infrastructure problem which we are encountering is the need to develop water systems to provide suitable drinking water to a rapidly growing rural population in Washington County. Thanks to Beaver Lake, we do have a good source.

We recently received assistance from the Arkansas Industrial Development Commission, and from the Farmers Home Administration, to put in water systems to serve nearly 1,200 households, many of which formerly were served by wells that had become contaminated, or had to haul water from springs which have been increasingly contaminated.

As water lines are extended, and our transportation network improved, we can anticipate increasing growth in our rural population, which will in turn, put additional demands on these systems.

We realize the importance of economic development, job creation, and expanding employment rolls, but this can only be done if we have a corresponding development and expansion of our infrastructure and public works system. We intend to do our part to address the infrastructure problems that we have outlined, and I am firmly convinced that by forming a partnership with the State of Arkansas, the Federal Government, and the private sector, we can properly maintain and expand our infrastructure, as needed.

It is unfortunate that our nation faces a huge budget deficit and an enormous national debt. However, I would appeal to the committee, and the entire Congress, that they recognize the infrastructure needs here and across the nation, keeping in mind that increasing mandates to the local governments without supplying the necessary financing, creates a considerable hardship.

Additionally, any move to remove the deductibility of local taxes on Federal Income Tax Returns, will only compound the problems that we have locally in generating sufficient revenues to meet our infrastructure and public works needs.

The release of Highway Trust Fund monies could help greatly and a formula for distributing federal highway funds, including public transit funds, more in line with what is generated by Arkansans, would certainly be looked on with great favor.

I want to thank the committee again, and that concludes my comments.

[The prepared statement of Mr. Johnson appears on p. 1696.]

The CHAIRMAN. Thank you, Judge Johnson, and our final witness is the Honorable Bruce Rutherford, Benton County Judge.

TESTIMONY OF BRUCE RUTHERFORD, BENTON COUNTY JUDGE, BENTONVILLE, AR

Mr. RUTHERFORD. Thank you, Mr. Chairman, Honorable John Paul Hammerschmidt, and other Members of the committee.

A strong basic infrastructure is vital to the economic base of this area. As we all know, Northwest Arkansas is accelerating in the areas of agriculture, industry, and recreation. Therefore, it is necessary for the state to provide sound highways and sturdy bridges to keep commerce rolling.

As most of you well know, Northwest Arkansas is one of the fastest growing areas shown by the 1990 census. This contributes to the increased needs for highways, bridges, rural water and solid waste disposal.

I feel there are two significant needs for four lane limited access highways in Northwest Arkansas. First, being U.S. Highway 412 between Siloam Springs and Tontitown. This would link U.S. 412 with the soon to be completed Cherokee turnpike. I think the increased traffic on U.S. 412, an already dangerous highway, will be shocking once the Cherokee turnpike is completed in the Spring of 1991. This will cause a tremendous bottleneck affect on Highway 412 at the Arkansas-Oklahoma State line.

Secondly, the rapid completion of Highway 71 to an interstate type highway, linking Interstate 40 and Interstate 44. This will enable us to connect with other commerce areas. The accident and death rate on both Highway 71 and Highway 412 is already astonishing.

I would like for you to consider supplementing annual funding by initiating legislation to spend down the Highway Trust Fund balances. This would provide Arkansas additional funding, which I feel we are entitled.

The burden of providing for the collection and disposal of America's solid waste, is a pressing concern of local governments all over our area, and the burden is growing.

While we agree solid waste must be disposed of in an environmentally safe and ecologically sound manner, the local governments need additional resources made available to help solve the current and future problems of solid waste disposal.

Also, because of our rapid growth and increased population with rural subdivisions, there is an extreme need for rural water systems to ensure safe water.

I want to take the opportunity to thank the committee for asking me to participate in today's hearing. With the exchange of ideas, and your interest in our community, we should sufficiently handle any situation that arises to link our growing area with the major arteries of the working world. We need to keep in mind that increased growth adds to the stress of our current installation. Thank you.

[The prepared statement of Mr. Rutherford appears on p. 1749.]

The **Chairman**. Thank you very much. Thank you all.

As local officials, you are the closest in seeing the real importance of infrastructure, and given your experience, what factors do you think we should consider or give priority to in drafting a national infrastructure program? Anything specific?

Any other questions of anyone?

[No response]

The **Chairman**. Mr. Hammerschmidt.

Mr. **Hammerschmidt**. Well, I just want to thank all these gentlemen.

Listen, I could go on here for a long time. I know we are running over an hour, and we saved you guys until last, but you are the ones that really handle the problems, because you're right on the firing line—the Mayors, the City Administrators, and the Judges—and I work with every one of these fellows in such a fine and cooperative way.

I want to thank you for being patient, for bringing this good information.

Mr. Chairman, I don't think that we ought to take time for questions from me, at least, but others may have some.

The **Chairman**. Any questions?

Mr. **McEwen**. May I speak, Mr. Chairman?

The **Chairman**. Yes.

Mr. **McEwen**. Let me just place a question and then you needn't answer now, because I would like to have you answer it over lunch, when we are not constrained by time.

But there are places around our country where we spend billions and billions of dollars, and you can go from street corner to street corner, and they have got mental health facilities, and transit facilities, and you name it, there are billions of federal dollars.

We have come here and there are not billions of federal dollars. People are working, and paying taxes, and building companies, and they keep a low employment, that raises the future of our nation, and I would like to have your analysis as to what you think the difference is between the people here and the places where we put billions of dollars, where there is high crime, high unemployment, high destruction, and here where there is low unemployment, low crime, and high tax paying. And that is my question for you to answer.

Mr. **Hammerschmidt**. Mr. Chairman?

The **Chairman**. Mr. Hammerschmidt.

Mr. Hammerschmidt. Just one final comment. I want to thank all of our witnesses that have been here. I think these have been great hearings, and very helpful to our panel, and to our understanding, and I want to thank especially my colleagues who have taken time from their weekend to come down here to Arkansas from all parts of the country.

This guy flew in from Saudi Arabia, the Persian Gulf, to get here, and Members have come from California, and all over, and I want to express my appreciation to them.

There is one other thing. We only had so much time, and we could only accommodate so many people on the panel. We sort of made a subjective arbitrary judgment on that. But there are many other Members that have things to say in our hearing. I see Bob Baxter out there, and I know there are others.

So, Mr. Chairman, I would ask that our hearing record be left open so that they may have an opportunity to submit testimony for our record, for 30 days.

The **Chairman.** No objection?

[No response]

The **Chairman.** So ordered.

Anything further comments or questions here?

Mr. Mineta. Mr. Chairman, all I would like to do is, as a Mayor, as was my colleague here, Mr. Roe, and having been a Mayor, I know really what all of you have gone through, and the local government, without a doubt, is really the toughest level of government to be dealing with, in terms of what you have to go through on a day to day basis.

So, all I can say is thanks a million for what you are doing.

The **Chairman.** Well, I also want to thank all of our witnesses here today for their expertise, and for helping us better understand the importance of our Nation's infrastructure needs, from the perspective of the State of Arkansas.

I also want to thank the people of the Third District for their warmth and hospitality, and John Paul, I thank you for your untiring interest, support, and leadership, and your staff for their hard work in making today's hearing a success.

Mr. Roe.

Mr. Roe. Yes, thank you, Mr. Chairman. I do want to join with you and John Paul, particularly thanking the Mayors as the wrap up group for our meetings this morning. They were very constructive, and we have learned a lot, and I think that we can carry a good message back to the Congress.

May I leave you with the thought, however, don't let John Paul get away. He does as much for New Jersey, I've got to tell you this, as he does for Arkansas, and Roe does as much for Arkansas as he does for New Jersey.

The **Chairman.** Mr. Hammerschmidt, do you want to answer that or not?

Mr. Hammerschmidt. No. I want to just add one more thing. You know, we take our staff for granted. They do such excellent work, and we don't pay that much attention to them, but we couldn't operate without our staff, and I just want to thank them.

The **Chairman.** The committee stands adjourned.

[Whereupon, at 1:00 p.m., the committee was adjourned.]

PREPARED STATEMENTS OF WITNESSES

A Presentation to

the

Committee of Public Works and Transportation

One hundred first Congress

U. S. House of Representatives

Glenn M. Anderson, Chairman

September 8, 1990

James B. Blair
P.O. Box 2020
Springdale, AR 72765-2020
(501) 756-4272

Mr. Chairman and Distinguished Committee Members:

My name is Jim Blair. I am chairman of the University of Arkansas Board of Trustees, General Counsel of Tyson Foods, Inc., and a member of the Northwest Arkansas Council.

I have been asked to present an overview for this panel.

I cannot tell you how much all of Northwest Arkansas appreciates being the sight of this hearing for this very agust and distinguished body. We do recognize that to some degree this is a tribute to our own congressman, the ranking minority member of the committee.

Most of you probably do not know that when John Paul Hammerschmit was elected to the Congress in 1967, he was really simply running as a favor to Winthrop Rockefeller to help strengthen Winthrop's bid for governor. He had no hopes or intentions of being elected and was very put out when he had to leave these lovely hills for Washington D.C. However, his loss has been our gain.

This panel that sits before you are C.E.O's who collectively employ over 350,000 people (that is almost a congressional district) and who generate revenues which exceed 35 billion dollars. Security analysts generally believe that this group of people will have revenues that exceed 70 billion dollars within five years. You have in front of you the largest chicken farmer in the United States. Really the largest poulty based food company, the largest trucking company in the United States, and based on current figures, the larges retailer in the United States. I will introduce them to you after this overview.

When the Interstate highway system was created in the 50's, this area of the United States was not growing as rapidly as the United States in general. Perhaps the war was a distraction longer in the heartland. But, beginning in 1960 the population of Washington and Benton Counties began to accelerate at a rate much beyond that of the national population and this population trend in Northwest Arkansas has continued to change at an increasing rate of change to the point that it is almost an upward thrust as compared to a slightly elevating line for the U.S. population. We have a chart here which illustrates this and these two counties will have a population that will, in the easily projectable future, exceed three hundred thousand people. It exceeds two hundred thousand people at the present time. It is one of the five largest population areas which has no direct access to the interstate highway system.

This is also soon to be the population center of the United States. You all know the geographic center is in Kansas, not far away. The population center is somewhat southwest of St. Louis, Missouri and is moving this way in the reasonably projected future. The center of the actual population of the United States will be the two counties you are in here; Washington and Benton County Arkansas. We have a chart illustrating this.

Northwest Arkansas is a net exporter overseas, largely because of the poultry business and it helps the country in the trade deficit. Wal-Mart, which you will hear from in a minute, has revitalized many small American industries by its "Buy America" program. We have a very low unemployment rate. Our position is that of a potted plant that has grown as fast as we can with the available resources we have in the pot. We are in danger of becoming like a potted plant that is root bound in that we need help in our infastructure if we are going to continue to provide the best for our people and our country. We believe we can do this in such a way that is more than fair and equitable but it would be a bargain in the expenditure of any necessary funds. It would involve greater bang for the buck and it would meet all the tests that we are aware of that have been put on the expenditure of federal monies.

We need three things. Two of them are relatively modest, the third one we realize is a major request.

The first item is that U.S. DOT has concluded and informed congress that constructing interstate 49 from Kansas City to Shreveport is technically feasible and that a four lane limited access facility is appropriate and eligible for funding. FHWA has verbally stated that Interstate 49 is one of a very few routes with that distinction. We need this route designated as a highway of national significance and the appropriation of funds annually under the new HSNS category.

To supplement the annual funding we request that congress initiate legislation to spend down the highway trust fund balances, which currently total 19 billion dollars, to provide Arkansas additional funding over and above the level to which it would otherwise be entitled to construct this high priority project and an additional project I will refer to in a minute.

I should point out that Arkansas is a donor state to the highway and mass transit trust funds. It receives a return of only eighty two cents for each dollar in federal motor fuel taxes paid by Arkansas motorists.

The second thing we need is what I would categorize as a special demonstration project. It mirrors the President's National Transportation Policy in forging a partnership of the Federal Government the states of Arkansas and Oklahoma and the Oklahoma Turnpike Authority, along with an innermodal link to the port of Catoosa on the McClellan-Kerr Arkansas River Navigation System and would also be involved in our third request, which is the Northwest Arkansas reliever airport.

The second request is that there be the development of a special demonstration project which constructs the missing link between Northwest Arkansas and the interstate system along the Cherokee Turnpike, which is U.S. 412, to connect to I44 at Tulsa. This project meets funding and programmatic criteria because it utilizes user fees and makes a major contribution to highway safety.

The narrow two lane portion of the Tulsa to Springdale route in Arkansas has an average three year accident rate of 4.6 per one hundred million miles driven over the past three years, which is 2.7 times the state average for rual two lane highways and 5.3 times the state average for rual four lane highways. When the Cherokee Turnpike is completed, it will funnel more and more traffic from a high speed limited access four lane facility into Arkansas' antiquated two lane highway and dramatically increase the accident rate. So this project not only will aid economics, growth and productivity, but it will save significant lives and significant loss of productivity because of accidental injury.

Our third item, which you will hear about in great detail, is the construction of a reliever airport. We would propose that public and private sectors combine their resources and expertise to enhance transportation capacity along the lines of the alliance airport located outside of Dallas. The idea would be to create a major air carrier hub in Northwest Arkansas which would divert air cargo aircraft on long-haul, national and international flights away from big passenger traffic terminals such as Chicago O'Hare, Dallas Ft. Worth, Memphis, Kansas City, and St. Louis. It could be done cheaper here than anywhere else. It could be done cheaper here than to add expansion and congestion to existing airports and you will be given detail on this by other panel members.

We would also like to endorse the federal aid surface transportation highway program proposed to US DOT and Congress for the state of California, which includes a split of total funding between HSNS and FAST on a 50/50 basis. The state authority to transfer 20% between programs because such split will increase Arkansas' allocation and provide funding flexibility to build highways of high state and local priority.

The appropriation formula should include the consumption of diesel fuel as a factor, with a weight of at least 1/3, to provide funding to build roads where the trucks are.

We believe that the program should ensure that no state gets less then 100% of its annual contribution to the highway and mass transit trust fund. We take that position for obvious reasons.

Again, thank you very much for your visit to Northwest Arkansas and your attention. I will now introduce these distinguished panel members.

ADDRESSING THE TRANSPORTATION CHALLENGES OF NORTHWEST ARKANSAS

A Presentation to

the

Committee of Public Works and Transportation

One hundred first Congress

U. S. House of Representatives

Glenn M. Anderson, Chairman

September 8, 1990

Northwest Arkansas Council
Post Office Box 725
Fayetteville, Arkansas 72702-0725
(501) 575-6075

NORTHWEST ARKANSAS COUNCIL

September 8, 1990

ADDRESSING THE TRANSPORTATION CHALLENGES OF NORTHWEST ARKANSAS

Executive Summary

I. Introduction: The Surface Transportation and Uniform Relocation Assistance Act of 1987 expires on September 30, 1991. The debate triggered by the upcoming expiration of the legislation and the prospect of completing the Interstate system, presents a major generational opportunity for the 102nd Congress, meeting in January, 1991, to frame a new surface transportation policy responsive to the needs of today's economy and tomorrow's opportunity.

The Infrastructure field hearing will gather information leading to the development of national policy and the eventual establishment of two highway programs: The Highway System of National Significance and the Federal Primary-Aid System.

Our task is to present convincing argument to the Members of Congress, the staff of the Public Works Committee who will write the legislation, and the members of the U. S. Department of Transportation (US DOT) / Federal Highway Administration (FHWA) who will make the Administration's proposal to Congress, that the needs of Northwest Arkansas for an improved highway system is of national scope and meets the funding and programmatic criteria for development.

II. Special Demonstration Projects: We propose the development of a project which mirrors the President's National Transportation Policy by forging a partnership of the Federal Government, the States of Arkansas and Oklahoma, the Oklahoma Turnpike Authority, and the private sector which utilizes a blend of funding to correct Congressional recognized deficiencies in the existing highway program structure.

We respectfully request the development of a special demonstration project which constructs the missing link between Northwest Arkansas and the Interstate System along the Cherokee Turnpike (US 412) to I-44 at Tulsa. Such a project meets funding and programmatic criteria by the utilization of user fees, the improvement of highway safety, the relief of highway congestion, the provision of rural access, and the development of an efficient intermodel link to the Port of Catoosa on the McClelland-Kerr Arkansas River Navigation System and the proposed Northwest Arkansas Reliever Airport.

We further request that the project be funded with federal-aid highway funds allocated to the State in addition to the funding to which Arkansas would ordinarily be entitled.

III. Aviation: Given the projection by the Federal Aviation Administration that aircraft activity will continue to outpace the capacity at major airports, one method of providing relief to both air space and airport overcrowding, congestion, and noise and air pollution at the major hubs would be to establish a reliever airport in a location with proximity to the geographic and population center of America.

We would propose that the public and private sectors combine their resources and expertise to enhance transportation capacity. The creation of a major air cargo hub in Northwest Arkansas to divert air carrier aircraft on long-haul national and international air cargo flights away from Chicago O'Hare, Dallas-Fort Worth, Memphis, Kansas City, and St. Louis Lambert would provide air space, airport, and ground access capacity in Mid-America's major hubs which could be set aside for the use of commercial aviation and the passengers they transport.

The air cargo carriers of the Nation are looking for a location which is centrally located within the United States which has the air space and airport capacity to handle wide-body aircraft on demand. The air cargo carriers appear ready and willing to plan, and help pay for, the development of runway capacity and the supporting state-of-the-art facilities required to more rapidly and economically process international and domestic freight for trans-distribution nationwide.

In addition, there are few places in America, none around the major hubs, where land can be purchased and facilities constructed for a lesser federal investment than would be required in Northwest Arkansas. We would like the opportunity to try.

Therefore, we respectfully request that the Northwest Arkansas Airport be included in the National Plan of Integrated Airport Systems as a new reliever airport; that favorable consideration be given to an immediate application for funding for a Northwest Arkansas Airport Master Plan; and that construction funding be set aside for the project as a Special Demonstration Project.

IV. Highway System of National Significance: The US DOT has concluded and informed Congress that constructing I-49 from Kansas City to Shreveport is technically feasible and that a four-lane, limited access facility is appropriate and eligible for funding. FHWA has verbally stated that I-49 is one of a very few routes with that distinction, therefore it will, in all probability be designated as a Highway of National Significance. We need such designation and the appropriation of funds annually under the new HSNS category.

To supplement annual funding, we should request that Congress initiate legislation to spend down the Highway Trust Fund balances, currently totaling $19 billion, to provide Arkansas additional funding over and above the level to which it would otherwise be entitled, to construct those high priority projects which have met the test of feasibility and which are of high national significance.

V. Federal Primary-Aid System: Funding of this portion of the federal highway program involves statements of policy which allocate funding among the states. The debate on this issue will be crucial in determining the annual level of funding for Arkansas. Therefore, the following points should be addressed:

- Endorse the Federal Aid Surface Transportation - Highway (FAST-Highways) Program proposed to US DOT and Congress by the State of California (Caltrans) which includes:
- A split of total funding between the HSNS and FAST on a 50%/50% basis with state authority to transfer 20% between programs. Such a split will increase Arkansas' allocation, and provides funding flexibility to build highways of high state and local priority.
- The appropriation formula should include the consumption of diesel fuel as a factor with a weight of at least 1/3 to provide funding to build roads where the trucks are.
- Ensure that no state gets less than 100 per cent of its annual contribution to the highway and mass transit trust funds. Arkansas currently is a donor state, receiving a return of only 82 cents for each dollar in federal motor fuel taxes paid by Arkansas motorists. The attaching information depicts the poor condition of Arkansas roads, it dependency on vehicle movement, and its relative standing in comparison to other states for funding.

An Overview of Northwest Arkansas

Northwest Arkansas, the Third Congressional District of Arkansas, a multi-billion dollar economic hub of production and distribution at the population center trendline of the United States, has experienced profound population and economic growth over the past 30 years. Despite the fact that the region is one of the largest centers of population in America which does not have a four-lane link to the Interstate system, two counties of that region, Benton and Washington, have seen their populations grow 129 per cent since 1960.

According to the preliminary 1990 census figures, Benton County had the second largest population increase of any county in Arkansas during the decade of the 80s, and Washington County ranked ninth. With an 18 per cent increase, the two-county population growth accounts for almost 64 per cent of Arkansas' total population increase for the period from 1980 to 1990 in recording a rate of growth which is 8.2 times the state average.

The economic well-being of the two county mirrors the growth in population as evidenced by assessments of real and personal property which were 15.9 times larger in 1986 than 1960, and bank deposits which have grown 1,960 per cent during the same period.

Looking forward, the future looks equally bright, as some early projections call for the two-county population to almost double again over the next two decade as the region continues it economic growth.

The growth of Northwest Arkansas has been fueled by three distinct economic factors: Business and Industry, Retirement, and Tourism and Recreation.

Business and Industry

The 1988 Report of Covered Employment and Earnings lists Benton and Washington Counties as the location of 310 manufacturing firms and 4,234 other employers that provided employment for 88,805 people who earned $1.5 billion during 1988. And that employment is growing. A mid-1980s report by the Arkansas Employment Security Division projected that Northwest Arkansas' employment would grow at a rate which was 66 per cent greater that the state average through 1995. To quote from that report "... the economic growth is being accomplished without a interstate highway system or a major airport. Transportation has been a major disadvantage, but efforts are being made to improve the system. These efforts, coupled with the educational and research facilities available and the progressive attitude of the city and county governments, make the economic growth of the area seem almost inevitable."

Inevitable growth does seem to be the picture for Northwest Arkansas when a listing of its major employers is reviewed. Many of America's leading manufacturing, distribution and trucking companies call Benton and Washington Counties home. Wal-Mart Stores, Inc., the nation's largest retailer, Tyson Foods, Inc., the nation's leading producer of poultry products, and J. B. Hunt Transport, Inc., the nation's largest provider of truckload freight services have their corporate headquarters in Northwest Arkansas.

In addition, many major national and international firms have located new and expanded manufacturing and distribution facilities within the region.

Retirement

Northwest Arkansas has been recognized nationally as an ideal site for retirement. Such recognition, and the resultant influx of retirees, has been a major factor in Northwest Arkansas' generation of almost 29 per cent of the state's in-migration and 101 per cent of the state's net migration during the period from 1980 to 1985. The hills and lakes of the Ozark and Boston Mountains have attracted thousands of new settlers who have greatly aided the economic well-being of the region. An improved transportation system can only enhance that growth by providing better access, thereby attracting greater numbers of potential retirees to share the good life of retirement in Northwest Arkansas.

Tourism

Northwest Arkansas, with its natural beauty, lakes and national rivers, has long been a destination for people who seek outdoor recreation. During 1989, millions of people visited the recreational areas of Beaver, Bull Shoals, Norfork and Table Rock Lakes and the Buffalo National River. In addition, the area's five state parks and the thousands of acres of National Forest attract a steady stream of visitors from throughout the county who want to experience the beauty of dogwoods in the spring, the active days of summer, and the fabled Flaming Fall Review.

The region, richly endowed with an agreeable climate, a wealth of natural resources and scenic beauty, and a geographic location at the center of America's future population, can only expect continued growth and economic development as its transportation systems improve.

I. Introduction:

The Surface Transportation and Uniform Relocation Assistance Act of 1987 expires on September 30, 1991. The debate triggered by the upcoming expiration of the legislation and the prospect of completing the Interstate System, presents major generational opportunity for the 102nd Congress, meeting in January, 1991, to frame a new surface transportation policy responsive to the needs of today's economy and tomorrow's opportunities.

The rich potential of this opportunity to create a new national highway system as the focus of federal-aid to highways in the post-Interstate era, will be irrevocably lost if the debate and policies that emerge default to the assumptions, institutional relationships, and programs that shaped the policies of three decades ago. The nation's economy, demographics, institutions, political agenda, international relations, infrastructure, and its transportation problems have fundamentally changed since the creation of the Interstate System.

It is within this changed environment that Congress must fashion the objectives and programs of a new national surface transportation program. A new program must be designed to:

- refocus national policies to respond to urban and rural access;
- give priority to projects that offer the best solution to each region's transportation problems;
- establish new partnerships and respective responsibilities that will assist the nation to remain competitive in a global economy; and
- provide accountability to Congress for achieving national objectives.

It is believed that structural changes in the overall federal, state, and local transportation partnership are critical to an efficient and responsive use of whatever level of resources that may be provided. It is our clear intent that the proposed structural changes should not be considered to be contingent upon expanded federal funding.

II. Special Interest Projects

Special interest projects appear to be the result of Congressionally recognized deficiencies in the existing highway program structure. Special interest projects tend to address gaps in national policy.

When a need for a special interest project is identified, it should meet certain funding and programmatic criteria. Those are: the special interest project is a high priority within the statewide transportation program of projects; it is clearly among the highest priorities within the local jurisdictions; and the state/local agencies are willing to share in the cost of the project.

U. S. 412

President Bush's newly published National Transportation Policy calls for a restructured transportation partnership which gives state/local government and the private sector the tools they need to address critical requirements in transportation.

We propose the development of a project which mirrors that national policy by forging a partnership of the Federal Government, the States of Arkansas and Oklahoma, the Oklahoma Turnpike Authority, and the private sector in meeting the transportation needs of the Nation by utilizing a blend of financing which helps bridge the gap between transportation infrastructure investment and funding.

We respectfully request the development of a special demonstration project which constructs a 20 mile section of U. S. 412 from the Arkansas - Oklahoma border at Siloam Springs to the junction of U. S. 71 at Springdale to provide the missing link between Northwest Arkansas and the Interstate system along the Cherokee Turnpike (U. S. 412) to I-44 at Tulsa.

Such a project meets funding and programmatic criteria by providing not only rural access to the Interstate system, but by providing an efficient intermodel link to the Port of Catoosa on the McClellan-Kerr Arkansas River Navigation System, Tulsa International Airport and the proposed Northwest Arkansas Reliever Airport.

We further request that the project be funded with federal-aid highway funds specifically allocated to the State of Arkansas in addition to the minimum allocation funding to which Arkansas would ordinarily be entitled.

To define the need for a special demonstration project, the following factors should be taken into account:

a. The project calls for the utilization of user fees generated by the Cherokee Turnpike to augment state and federal funding to develop a project which would link rapidly growing Northwest Arkansas with four-lane highway access to the Interstate system.

b. The narrow, two-lane portion of the Tulsa to Springdale route in Arkansas has an average accident rate of 4.60 per 100 million miles driven over the past three years, 2.7 times the state average for rural two-lane highways, and 5.3 times the state average for rural four-lane highways. With the completion of the Cherokee Turnpike, and the funneling of more and more traffic from a high speed, limited access, four-lane facility onto Arkansas' antiquated two-lane highway, the accident rate is expected to increase dramatically.

c. Relieve congestion: 1989 average annual traffic volumes on U. S. 412 between the Arkansas-Oklahoma state line and U. S. 71 at Springdale ranged from 5,180 to 12,620. However, a 1987 study of the condition of an 81 mile stretch of U. S. 412 east and west of Springdale indicated that 92 per cent of the highway is 2-lane, with 99 per cent having should width of less than 8 feet, and 79 per cent less than 4 feet. Seven per cent of the route has zero shoulder. Safe passing sight distance is not available on 66 per cent of the route, and only four truck climbing lanes are available to relieve congestion.

III. Aviation

The United States enjoys the most extensive and sophisticated aviation system in the world today. Air travel is second only to the private automobile as the primary mode of intercity passenger transportation in the United States, and the air cargo industry, although still small be conventional tonnage and ton-mile measures, is rapidly growing.

The principal challenge facing aviation planners over the next decade will be to find a way to accommodate the projected increases in demand for air transportation services without compromising air safety, especially in the 21 primary air carrier airports which are now experiencing more than 20,000 hours of annual flight delays at a yearly cost to airlines and U. S. businesses of at least $5 billion.

By virtually any measure, commercial aviation has been the fastest growing mode of transportation for over a decade and shows no signs of relinquishing that distinction. Between 1975 and 1987, airline revenue passenger-miles increased 141 per cent, enplanements increased 118 per cent, and cargo ton-miles increased 110 per cent.

The current air transportation infrastructure,both airports and airways, has its most crucial problems at the major air carrier hubs which account for nearly 69 per cent of all commercial air passenger traffic. The National plan of Integrated Airport Systems (NPIAS) anticipates that new airports will be constructed at some locations and capacity improvements will be made at other airports. Nevertheless, aircraft activity is expected to continue to increase faster than capacity can be added at most busy air carrier airports, and a gradual increase in congestion and delay is anticipated.

Increasing Capacity

Given the projection by the Federal Aviation Administration that aircraft activity will continue to out-pace the capacity at major airports, one method of providing relief to both air space and airport overcrowding, congestion, and noise and air pollution at the major hubs would be to establish a reliever airport in a location with proximity to the geographic and population center of America.

We would propose that the public and private sectors combine their resources and expertise to enhance transportation capacity. An example might be Alliance Airport, located outside Dallas, which demonstrates a forward-thinking approach to providing needed transportation capacity by developing a cooperative private, federal, state and local effort to build new facilities to accommodate cargo and passenger transportation.

The creation of a major air carrier hub in Northwest Arkansas would divert air carrier aircraft on long-haul national and international air cargo flights away from Chicago O'Hare International, Dallas-Fort Worth International, Memphis International, Kansas City International, and Saint Louis Lambert International. The result would provide added air space, airport and ground access capacity in Mid-America's major hubs which can be reserved for the use of commercial aviation and the passengers they transport.

The creation of a new reliever airport facility in Mid-America that is dedicated to the rapid and economical processing of air freight merits consideration for two reasons.

First, the air cargo carriers of the National are looking for a location that is centrally located within the United States that has the air space and airport capacity to handle wide-body aircraft on demand. The air cargo carriers appear ready to plan, and help pay for, the development of runway capacity and the supporting state-of-the-art facilities required to more rapidly and economically process international and domestic freight for trans-distribution nationwide.

In addition, the air cargo carriers are projecting the need to develop new, major maintenance facilities for their expanding fleet of aircraft. By combining those projected new facilities at an air cargo airport located at the center of America's population and geography, the utilization of aircraft and ground facilities can be enhanced.

Second, there are few places in America, none around the major hubs, where land can be purchased and facilities constructed for a lesser federal investment than would be required for such a facility in Northwest Arkansas. We would like the opportunity to try.

Therefore, we respectfully request that the Northwest Arkansas Airport be included in the National Plan of Integrated Airport Systems as a new reliever airport; that favorable consideration be given to an immediate application for funding for a Northwest Arkansas Airport Master Plan; and that federal construction funding be set aside for the project as a Special Demonstration Project.

IV. Federal Highway Program - Highway System of National Significance

The Highway System of National Significance (HSNS) Program, as authorized by Congress, would aim to preserve our nation's investment in its interstate transportation system; aid interstate commerce and national defense; and expand our domestic and international commerce and trade. The HSNS would be a state designated highway network based on Congressionally established national transportation goals and objectives.

Each state Department of Transportation in cooperation with the United States Department of Transportation (US DOT), would designate its HSNS based on Congressionally identified criteria that reflect the national goals and objectives for the HSNS.

Congress would set the broad goals and objectives for the HSNS. The US DOT would establish specific measures to be used by states to assess the performance of the HSNS in meeting these goals and objectives and report to Congress.

Interstate 49

The State of Arkansas, working in conjunction with the States of Louisiana, Missouri, Oklahoma and Texas, has prepared and submitted to the U. S. Department of Transportation the Kansas City, Missouri to Shreveport, Louisiana Multi-State Highway Feasibility Study.

The study reports the feasibility and necessity of constructing 503 miles of controlled access highway with an estimated cost of $1.7 billion in 1987 dollars. The Arkansas section of the route covers 267 miles and has an estimated construction cost of $1.093 billion.

The Department of Transportation agrees with the States' conclusion that constructing this route is technically feasible and that a four-lane, limited-access facility is appropriate, thereby ensuring a high quality of service and continuity of design along the entire route length from the Gulf of Mexico to the Great Lakes.

The Federal Highway Administration has verbally indicated that the Kansas City to Shreveport Corridor (I-49) is the only study currently of record which has met the test of feasibility, and there is high probability that the route will be named to be part of the Highway System of National Significance (HSNS).

The Department of Transportation, in its transmission of the study to the Speaker of the House, states that the route from Kansas City to Shreveport is eligible for Federal-aid funding, such as the assistance DOT makes available to the States each year by formula for Federal-aid primary projects. However, DOT further notes that insufficient funding is available from annual appropriations to meet all needs.

In order to help meet those needs, the Federal Highway Administration (FHWA), in its current draft of the proposed Reauthorization of the National Highway Program, recommends a "fiscally responsible expenditure of the Highway Trust Fund balance", currently $19 billion, over the five year period from 1992 to 1996.

We respectfully request that Congress initiate legislation to draw down the Highway Trust Fund balances to provide additional funding to the states, through an equitable allocation formula, over and above the level of funding to which the states would otherwise be entitled under the minimum allocation formula, thereby allowing the states to construct those high priority projects which have met the test of feasibility and which are of high national significance.

The FHWA administrator, Thomas Larson, in describing the parameters the FHWA will use in recommending establishment of the new highway system, has asked the states to submit data which permits system evaluation. However, the preliminary allocation of highway miles to the State under FHWA's tentative draft of the HSNS is insufficient to meet the needs of Arkansas. According to the Arkansas Highway and Transportation Department, the allocation of 1,110 to 1,555 miles will not cover the 550 miles of the existing Interstate system and allow for the inclusion of I-49 without taking other routes off the federal primary-aid system. There is concern that the Arkansas Highway Commission would not include the full I-49 route in the HSNS at the expense of routes in other parts of the state.

V. Federal Primary-Aid System

The Federal Primary-Aid System, or the Federal Aid Surface Transportation - Highways (FAST-Highways) Program as proposed by the State of California (Caltrans) is an extension of the Combined Road Plan Program concept created by Congress in 1987.

The FAST Program would provide a framework for states to pursue broad national goals and objectives set by Congress yet recognize the state and local focus of the FAST system and its support of the HSNS.

The FAST Program would allow states and local jurisdiction the flexibility to choose from a broad range of transportation solutions to respond to their unique set of transportation concerns. Such a program would provide flexibility to pursue solutions which bring the most efficient increase in mobility and effectively address regional and local needs.

A goal of the Caltrans FAST System is to improve intrastate and interregional commerce. One of its primary objectives is the establishment of major regional truck routes for access to economic centers, thereby reducing the travel time for trucks using the statewide FAST system. We strongly recommend the establishment of such an objective by the State of Arkansas.

VI. Highway Program Funding

The primary goal of the California FAST program is to provide each state with the opportunity to use its total resources (federal, state, local and other), in ways that will respond effectively to its specific circumstances of objectives.

To this end, Congress should specify the split of total funding between the HSNS and FAST Programs to be 50%/50% and that each state be allowed to transfer up to 20% of its total federal highway apportionment from one program to the other.

Funding allocations should be based upon factors that correlate well with the Congressionally defined goals and objectives, but are decoupled from direct ties to the manipulable factors of a mileage defined system.

The funding mechanism should take into account the factors of total public road mileage, diesel fuel consumption and vehicle miles traveled (VMT) in establishing an apportionment formula for the HSNS. We recommend that HSNS Program funds be distributed on a formula which allocates approximately 1/3 of funding to each factor: total statewide rural lane miles and VMT; total statewide urban land miles and VMT; and statewide diesel fuel consumption, which serves as a surrogate for heavy truck use.

Funding for the FAST Program should be apportioned to the states based on 100 per cent of the proportionate contribution each state makes to the federal highway trust fund. Such action would have a significant impart of the amount of federal funding received by Arkansas and correct the present inequities of the minimum allocation formula which are reflected by Arkansas' position as a donor state to the Federal Highway Trust Fund.

The following statistics provide clear-cut evidence of the state's position, relative to other states, in the areas of highway use and condition, expenditures for construction and maintenance, and the receipt of revenues to cover those expenditures.

Arkansas, with its high incidence of older, less fuel efficient vehicles, pick up truck and heavy diesel trucks, consumes more motor fuel per registered vehicle than any other state in the Nation. In 1988, Arkansas motorists consumed an average of 1,129 gallons of motor fuel, 62 per cent more than the average Pennsylvania motorist and 78 per cent more than the average Ohio motorist.

Arkansas motorists, because of their dispersion in rural communities, drive 13,468 miles per vehicle per year, a number exceeded by no other state in the Nation. California motorists, by comparison, drive 16 per cent less miles per vehicle per year while Iowa vehicles travel 38 per cent less than the average Arkansas vehicle.

Arkansas, with 16,169 miles, has the 16th largest state highway system in the county, only slightly less than New York and more than Tennessee or Minnesota. And those miles are wearing out. According to the Federal Highway Administration, only 14 states in the Nation have a higher percentage of highway miles with poor pavement condition. Conversely, only 28 per cent of the Arkansas highway miles are in good condition. By comparison, 40 states have a higher percentage of good highways, while only ten states have less.

Highway system deterioration, according to the National Transportation Strategic Planning Study issued by US DOT, is costly and discourages travel. To quote from the study, "Poor highway conditions can increase per-mile costs of highway usage by up to 30 per cent and travel time by up to 20 per cent when compared to costs for roads with good to excellent conditions. Changes in vehicle operating costs and travel time influence national economic productive and emergency response capabilities."

Relief for these problems of poor highway condition does not appear to be in sight, for Arkansas ranks 42nd among the states in capital outlay per mile and 46th in the county in disbursements per mile during calendar year 1988. By comparison, disbursements per mile in New Jersey were 19 times greater than Arkansas disbursements.

In order to generate financing to correct its highway problems, Arkansas motorists are paying state highway user fees, primarily motor fuel taxes, which raise sufficient state revenue to rank the state as 31st in the Nation during 1988. In addition to revenue generated by state highway-user fees, the state receives an annual allocation of funding from the Federal Highway Trust Fund. Supported primarily by the collection of federal motor fuel taxes, the Trust Fund is a crucial source of approximately 40 per cent of Arkansas' annual highway revenue.

Since the Highway Trust Fund was established in 1957, Arkansas has barely managed to break even as to the amount of money contributed and the amount of money received. On the other hand, 39 states have received more money than they have paid into the trust fund. And our position continues to decline.

The latest statistics show that Arkansas is currently receiving only 82 cents for each dollar that Arkansas motorists contribute to the highway portion of the Trust Fund. In Fiscal Year 1988, Arkansas contributed almost $173 million in highway user fees to the Trust Fund, and received payments of only $145 million, a shortfall of $28 million.

By comparison, only six states received less of their contribution to the trust fund than Arkansas, and some wealthy states, such as Connecticut, received almost $3 for each dollar paid in federal motor fuel taxes.

When comparing Arkansas' contributions to and receipts from the Mass Transit Account, we are at the very bottom of the list of states and receive only four cents for each dollar that Arkansans contribute. For example, in Fiscal Year 1988, payments into the Mass Transit Account by Arkansas taxpayers account for approximately $14.5 million. Apportionments from the fund, during that fiscal year, amounted to less than $600,000.

We recommend a minimum floor of turnback allocation equal to 100 per cent of the amount paid in to both the highway and transit funds, thereby bringing Arkansas closer to a break-even position relative to contribution to the trust fund.

Arkansas, with its vibrant trucking industry, consumes large quantities of diesel fuel, and that consumption is increasing dramatically as evidenced by an 88 per cent growth in total taxable diesel fuel consumption over the past decade.

Yet diesel fuel consumption is not a factor used in the apportionment formula for the federal funding of Arkansas highway. Therefore Arkansas does not receive an equitable return on its payment of diesel fuel taxes paid into the highway trust fund.

We recommend that funding be returned to the states where the trucks are running and that can be accomplished by adding diesel fuel to the formula for apportionment under the new allocation formula being debated as part of the new Highway System of National Significance.

Less affluent rural states and large urban states grappling with local and regional transportation problems need to maintain low state matching ratios for both federal programs. Therefore, we recommend that the matching ratio for the HSNS and FAST Programs should be 85% Federal and 15% State/Local/Other.

As has been done historically, the new transportation act should continue to include various assurance to provide equitable funding levels for all states.

UNITED STATES HOUSE OF REPRESENTATIVES

Hearing on Municipal Infrastructure Needs

September 8, 1990

Statement By:

Strib Boynton
City Administrator
City of Fort Smith, Arkansas

Chairman Anderson, Congressman Hammerschmidt, and the other distinguished Members of the U. S. House Committee on Public Works and Transportation. I thank you for the invitation to appear this morning, and in particular, I want to thank you for your interest in northwest Arkansas' infrastructure needs. Your leadership and willingness to tackle infrastructure issues are extremely important to us, as well as greatly appreciated and respected.

Solving the infrastructure problem has been Fort Smith's number one priority in recent years. Our 75,000 citizens are courageous and self-reliant. Our citizens also believe in taking clear and positive action to solve problems. Our community's civic, media, business and citizen leaders also believe in actively working together for the common good of all concerned.

I believe most communities do have the capacity to solve many of their own problems. In Fort Smith for instance, our citizens have approved ten separate referendums in the past five years specifically designed to rebuild our infrastructure, upgrade existing public services, and expand local educational opportunities. A list of the ten referendums is attached to this statement for your information.

In the last five years, our city has also successfully obtained and defended a hydropower license from the Federal Energy Regulatory Commission (FERC), the Corps of Engineers' Section 404 dredge and fill permit, and various other Oklahoma and Arkansas approvals for our new $37.5 million regional bi-state water supply project. The critically needed water project is well underway, and if all goes well, the 130,000 people in western Arkansas and eastern Oklahoma will enjoy a 50% increase in reliable and low cost water in another eighteen months.

Supported by our citizens, in the past five years our city has completed or currently has under construction more than $116.2 million in various water, sewer, street, flood control, and other needed capital improvements. A list of the various projects is also attached to this statement.

In the next couple of years, our community will be facing the significant challenge of how to best finance and schedule nearly $175.0 million in capital projects necessary to further expand our regional water supply project, upgrade our airport, repair deteriorated water distribution and sewer collection facilities, and continue rebuilding our city streets, bridges and drainage ways. Many of our capital expenditures also will be necessary to comply with new solid waste and sewage treatment regulations associated with recent amendments to the Clean Water Act, the Safe Drinking Water Act, and the Resource Conservation and Recovery Act. A list of Fort Smith's infrastructure needs for the 1990's is attached to this statement.

Today, I am tempted to simply ask you for money - because federal dollars can certainly help. Yet, I think we all recognize that federal dollars are limited by the staggering federal deficit and the growing saving and loan dilemma. Unless those problems are soon resolved, the various regional and local infrastructure needs discussed this morning will soon be academic and unmanageable.

Briefly, I believe there are at least four specific actions the Congress can take to help cities.

First, a clear and consistent national policy involving wastewater and stormwater treatment would help each of us to better plan and manage our sewer systems. For nearly twenty years, the federal government has actively encouraged cities to separate their wastewater and stormwater collection systems in order to comply with the National Pollutant Discharge Elimination System (NPDES) permit requirements of the 1972 Clean Water Act. Many cities, including Fort Smith, have spent millions of local dollars in recent years to develop and maintain the separate sewer systems as required by the federal government.

However, after millions of federal and local dollars have been spent across this country to develop and maintain separate sewer systems, the Clean Water Act was amended in 1989 to now require cities to address both stormwater and wastewater needs in their new NPDES permits.

While combining stormwater and wastewater treatment systems may eventually prove to be more cost effective than separate collection and treatment systems, reversing twenty years of national policy without any federal financial help creates a staggering financial burden for citizens and businesses in those cities that have already spent their local dollars to develop and maintain separate sewer systems.

Second, Section 404 of the Clean Water Act does not contain a specific time period in which opponents can appeal the issuance of a Corps of Engineers' dredge and fill permit. Although many federal laws specifically set a 30 or 60 day period to appeal an agency's decision to a court, Section 404 of the Clean Water Act does not. Consequently, groups opposed to needed projects can delay the permitting process indefinitely by waiting as long as they think the courts will allow before filing an appeal. I believe a clear and expeditious appeal process, including a 30 or 60 day appeal period, should be included in Section 404 in order to avoid potentially costly and unnecessary time delays on critically needed water supply and other projects.

Third, just about every community currently wants to recycle their way out of the solid waste crisis. Recycling is popular, but can only be an effective alternative if markets exist.

I suggest the Congress can best help cities by developing national and international markets for recyclable materials rather than mandating recycling as a solution. I believe communities will recycle if markets for recyclables are strong.

I believe at least two bills have recently been introduced in the Congress to help develop markets for recyclable products. The bills would provide tax incentives for recycling facilities, require the federal government to buy recyclable products, establish a labeling system for recyclables, and require the Commerce Department to create a national clearinghouse and advertising campaign for recycling. I encourage you to support these and other ideas to help develop strong national and international markets for recyclables.

Fourth, I also believe the Congress can help cities by supporting legislation giving cities greater financial and regulatory flexibility, and opposing legislation that might undercut our ability to solve our own problems.

Specifically, I believe the Congress should oppose any limitations on the federal deductibility of state and local taxes, allow cities access to the Highway and Aviation Trust Fund monies for needed local improvements, and provide cities with the greatest possible flexibility in the use of tax-exempt municipal bonds. I also tend to believe the Congress should commit to not impose costly new federal regulations on cities unless there is a corresponding federal appropriation to help cities finance the federal compliance costs.

I want to conclude by again thanking each of you, including Chairman Anderson and Congressman Hammerschmidt, for caring about northwest Arkansas' infrastructure needs. While many of us would like, need, and will ask for federal dollars - importantly - we also need your personal leadership in finding flexible alternatives and creative regulatory solutions as we attempt to solve our own infrastructure needs.

Your consideration is appreciated. Thank you.

SUCCESSFUL COMMUNITY REFERENDUMS
(1985 - 1990)

	Issues	Sponsor

4-MINUTE SPEECH - REGIONAL AIRPORT

My name is Raymond J. Ellis. I am a native of Arkansas, a long time resident of Fayetteville, and have an extensive background in air transportation.

Northwest Arkansas is located at the heart of the nation. It is at the cross roads of America. It is an educational, food producing, merchandising, and transportation area, all of which has made it one of the most progressive, fastest growing, and economical centers in the country.

The University of Arkansas with its state and nationwide impact is the nucleus and base from which the area has grown, and it is the catalyst for continued growth. We have some of the largest and leading trucking firms in the country based here; J.B. Hunt, and Arkansas Best Freight. We have the leading poultry producers, some of which are; Tyson's, George's, Peterson Industries and Hudson's Foods; and we have one of the top merchandising companies, Walmart. All of these companies grew up and are based in Northwest Arkansas. All of them have contributed massively to the growth, development, and economic base of the area. All of these institutions, and businesses have used the airplane as a business tool in the building of their own businesses. They have made great use of our airports and air facilities, and created great demand for public air services. Efficient, convenient, and safe airports and air service are vital to them as well as to the general public.

Northwest Arkansas has an outstanding system of airports and airways facilities, and until now, these facilities have kept pace with the growth and development of the area. But they are being outgrown. What we need now are improved airways and air traffic facilities, and an air carrier regional airport in order to meet the needs of this progressive area.

Drake Field, Fayetteville, which has served as the regional facility for many years, has one of the major, and most impressive enplanement statistics records in the central part of the country. These statistics have confirmed that fact and have exceeded the forecasts made in previous years.

Drake Field is served by four commuter airlines having connections with five major airlines at hub cities in the surrounding states. This commuter airline growth developed from the earliest air service companies serving this area, Scheduled Skyways, and Frontier Airline as the base, both of whom have been merged with newer, larger, and more progressive airlines. The commuter airlines serving this area are very positive in their need for an all weather airport meeting the national standard for a safe and highly efficient airport. A regional airport serving the public's need is vital to the continued growth and development of this area.

Of critical value to the national airport systems is the fact that a new airport facility which can serve Northwest Arkansas, can also serve Mid-America as a reliever airport to alleviate congestion at major air hubs of the heartland. In relieving airport congestion, air space, ground access, noise and air pollution problems are relieved as well.

Federal and State transportation funds are available through transportation trust funds, up to 90% of which can be used for the development of airports, and airport facilities. User taxes, federal and state, on airplane tickets, fuel, and sales taxes have been accumulating in Trust funds, and will continue to be paid into these funds.

Teams and organizations are ready to raise the local funds and to start the action. We are asking you to help in this project.

Thank you!

DEPARTMENT OF THE ARMY
UNITED STATES ARMY CORPS OF ENGINEERS
SOUTHWESTERN DIVISION
COMPLETE STATEMENT OF
BRIGADIER GENERAL STANLEY G. GENEGA
DIVISION COMMANDER
BEFORE THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
UNITED STATES HOUSE OF REPRESENTATIVES
SEPTEMBER 8, 1990

Mr. Chairman and Members of the Committee, I am pleased and honored to be here today to represent the Southwestern Division of the Army Corps of Engineers and to participate in this panel to discuss the Corps' interest, pursuant to its Civil Works Mission in the nation's infrastructure. I want to discuss two different, but related, matters on infrastructure. First, I will discuss the unique capabilities of the Corps in helping to solve some of the nation's infrastructure problems. Then, I will discuss some of our ongoing activities in the Southwestern Division — particularly in the part of northwestern Arkansas that is within our Division boundaries.

The Southwestern Division has a long history of developing water resource and military infrastructure in the Southwest. Through our Civil Works program, the Corps has been engaged primarily in construction of harbors and waterways, flood control projects and large multiple purpose dams. Our military missions have resulted in the construction of large military facilities, airbases and installations including associated infrastructure such as housing, roads, water supply and waste treatment plants, and solid waste disposal.

Until the decade of the 1980's, the Nation had not focused on the long term operation, maintenance and rehabilitation costs that our nation's decaying infrastructure would place on the shoulders of future generations. The study conducted by the National Council on Public Works Improvement and its report, Fragile Foundations, showed the need to develop systems today that will reduce future financial burdens. The Corps is concerned not only with the infrastructure that the Corps has developed but for the rest of our nation's infrastructure. Not only do we need to be efficient and effective in administering existing programs, but we must establish new and creative approaches for effective partnerships between Federal, state and local governments and the private sector.

In keeping with this philosophy, The Assistant Secretary of the Army for Civil Works, Robert W. Page, sponsored a forum in May on Capitol Hill with government and industry leaders to discuss opportunities for providing environmental infrastructure facilities through public/private partnerships. In addition, our Director of Civil Works, Major General Patrick J. Kelly, has established a Corps Infrastructure Task Force which has the responsibility to devise a Corps strategy for its contribution to the total national effort to address our many infrastructure needs. The plan involves maintaining and sustaining water resources, water supply, energy, solid waste disposal, hazardous and toxic waste disposal, and other infrastructure modes within the Corps mission areas and under existing authorities. Much of this plan calls for building further on Corps partnerships with other agencies of government. The infrastructure initiative included in the President's FY 1991 Budget is designed to initiate discussions with other agencies having diverse infrastructure missions in an effort to develop a broad Federal strategy. The Corps is prepared to play a constructive role in the infrastructure challenges of the future.

I would like now to focus on some of the water resource infrastructure problems and opportunities in Northwestern Arkansas.

One of the major facilities for infrastructure over which we have jurisdiction is the McClellan-Kerr Arkansas River Navigation Project. High water flows in each of the last two years have restricted traffic movements. However, the biggest problem that we face is the annual problem at the White River Entrance Channel. This is the first reach of the McClellan-Kerr and the water surface is not controlled by a dam but is controlled by the elevation of the Mississippi River. The Little Rock District is conducting feasibility type studies to determine a solution to the low water problem that is occurring annually and getting worse each year. A draft feasibility report has been completed. We expect to recommend a plan which consists of a lock and dam, Montgomery Point, with bottom operated gates and a 600-by 110-ft lock chamber near the mouth of the White River. However, the priority of funding available from the Inland Waterway Trust Fund for this project has not been established.

Another piece of infrastructure that is currently receiving a lot of our attention is Beaver Lake in Benton, Carroll, Madison, and Washington Counties, Arkansas. Beaver Lake was completed in 1966 with project purposes: flood control, hydropower, and water supply. In recent years it has been found that the water quality of the lake is increasingly in violation of the National Primary Drinking Standards from problems due to high nutrient concentrations. In Public Law 101-101, Congress appropriated funds for this project and directed the Corps of Engineers to implement best management practices in the Beaver Lake Watershed and monitor the effects of these practices on water quality. This is scheduled to begin in February 1991 with project completion date of December 1996.

With regard to the Arkansas River Basin levees, notwithstanding their age, they stood up quite well to the recent flooding. Our recently completed study found, however, that local officials should rehabilitate and repair them to insure proper functioning in the future. The estimated cost of repairs is about $11 million.

The Southwestern Division has responsibility for 18 hydro-electric powerplants of which 7 are in the Little Rock District. This capacity and energy capability forms a vital part of the marketing agency's resources. Several of these units are over 30 years old with the newest plants approaching 20 years. We will continue to monitor these to ensure proper performance.

In summary, we have not solved all the water resource problems in Arkansas or the Southwestern Division. The spring floods of the last two years have demonstrated only too clearly that even with our dams and levees operating as designed, we must continue to examine the need and justification for flood control and other water resources projects, including those related to environmental and wetland resources.

Mr. Chairman, that concludes my statement. I would be pleased to address any questions you or other members of the Committee may have.

STATEMENT OF LEONARD L. GRIGGS, JR., ASSISTANT ADMINISTRATOR FOR AIRPORTS, FEDERAL AVIATION ADMINISTRATION, BEFORE THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION, CONCERNING AVIATION INFRASTRUCTURE IN NORTHWEST ARKANSAS. SEPTEMBER 8, 1990.

Mr. Chairman and Members of the Committee:

I am Len Griggs, FAA's Assistant Administrator for Airports. I am responsible for overseeing the FAA's airport grant program which provides airport development assistance to communities such as this throughout the Nation. I am pleased to have the opportunity to appear before you today to discuss the aviation infrastructure needs of northwest Arkansas.

The FAA's airport grant program, which is authorized by this Committee, has been a key factor in making available substantial assistance to airports throughout the country. Since the enactment of the Airport and Airway Improvement Act of 1982, we have issued nearly 10,000 grants for $8.98 Billion to help finance airport development and planning projects at our Nation's airports. This has included funding for land acquisition, runways, taxiways, aprons, safety and security equipment, noise mitigation, and terminal buildings. The largest portion of the program--51%--has been for pavement construction and reconstruction which adds to the safety and integrity of the airport system. Of course, safety and capacity enhancement are key objectives of the program with projects contributing to safety accounting for 39.5% of the total and capacity for 49.1%. The remaining amount--11.4%--has gone for planning and noise mitigation projects. For the current fiscal year, our grant program level is $1.425 Billion.

There remains a pressing need for a strong airport program today, particularly with the capacity problems our national aviation system is experiencing in many areas of the country. There is a clear need for significant capital improvements to increase capacity if we are to meet the growing demands of the traveling public.

Our National Plan of Integrated Airport Systems lists more than 3,200 current airports and over 400 proposed new airports with multi-billion dollar needs. Traditionally, state and local authorities have funded about 70% of airport development needs. Secretary Skinner's National Transportation Policy recognizes that a continued strong local presence in planning and financing airport development is critical. Additionally, we have supported and the House of Representatives has passed legislation that includes a Passenger Facility Charge which would provide local communities the option of charging airline passengers a modest fee to assist in financing local airport-related projects.

Aviation is a cornerstone of economic vitality in the United States, and this is certainly the case in Arkansas. Since 1982, through airport improvement program grants, a total of $90.6 Million has been approved for airports in Arkansas. Of this total, $39.4 Million was in entitlement funds; the remaining $51.2 Million was from discretionary funds made available to the FAA by the Congress.

Aviation--both air carrier and general aviation--is particularly important in northwest Arkansas, where the highway system requires time-consuming travel through small towns and, in some cases, mountainous terrain. It is clear that a modern, well-maintained system of airports is important to foster the timely and efficient transportation of people and goods through this region.

There are nine existing airports in northwest Arkansas. Two of these airports are primary airports with air carrier service; the remaining seven are general aviation facilities. Four of these airports have received more than $1 Million in airport grant funds from Fiscal Year 1982 through the end of August 1990: Fayetteville ($4.74 Million); Fort Smith ($6.32 Million); Rogers ($3.94 Million); and Springdale ($1.97 Million).

There are also a variety of ongoing and planned projects at the nine airports in northwest Arkansas. At Fayetteville, we have a multi-year grant (FY 89-91) of $1.25 Million for obstruction removal, safety area improvements, and an aircraft rescue and firefighting vehicle. We anticipate that the airport may be undertaking additional work in FY 91 for an extended safety area and a helipad, and an FY 92 project for taxiway and apron improvements. At Fort Smith, there is a multi-year grant (FY 90-92) of $1.7 Million for taxiway reconstruction and runway lighting. Bentonville has a current airport master plan underway under a $13,000 grant, and as a result of that study may initiate a runway extension project in the future.

At Berryville, we anticipate the airport may undertake a project in FY 92 to extend and widen the runway. We expect a forthcoming project at Harrison to expand the apron and strengthen the runway in FY 93-95. At Russellville, a planning study is anticipated in FY 92. We expect to see a project in FY 91 at Siloam Springs to reconstruct an apron and taxiway. And at Springdale, we anticipate an FY 92 project for land purchase and apron construction, and a project in FY 93-94 to reconstruct the runway and taxiway. Clearly, the aviation officials in this area are working hard to upgrade and modernize their facilities to better serve the traveling public.

Under our Facilities and Equipment Program, which is also authorized by this Committee, we have scheduled an ASR-9 airport surveillance radar for delivery to the Fayetteville area during

July 1992. This state-of-the-art radar will be located in the vicinity of the Fayetteville Airport and will be used to provide radar air traffic control services for those airports within approximately 40 miles of Fayetteville. Radar data will be remoted from Fayetteville to the Fort Smith Airport air traffic control tower.

In closing, Mr. Chairman and Members of the Committee, I want to stress that we in the FAA recognize the importance of a strong aviation infrastructure in areas such as northwest Arkansas. And we also recognize the important contributions that areas such as northwest Arkansas, in turn, make to our national air transportation system.

We in the aviation community have been truly fortunate to have key allies in the Congress who recognize these needs as well, and we have all profited from the firm leadership shown by this Committee in helping us attain critical resources to meet the needs of aviation here in Arkansas and throughout the Nation. You may be assured of our willingness to work with the aviation community here in Arkansas and with this Committee to assure that we continue to address the needs of aviation at the local and national levels as we head into the 21st century.

That completes my prepared statement, Mr. Chairman. I would be pleased to respond to any questions you may have at this time.

The Honorable John Paul Hammerschmidt
424 Federal Building
Fayetteville, Arkansas 72701

Dear Congressman Hammerschmidt:

I am pleased to receive your invitation to participate in your Committee hearing on Saturday, September 8, 1990. There are twenty-two (22) Public Use Municipal Airports in the 3rd Congressional District. This includes four Commercial Service Airports. Eighteen (18) of the airports are in the National Plan of Integrated Airports Systems. There are five heliports at hospitals in the 3rd District.

Attached are portions of the Arkansas Airport System Plan which identify and project expected growth in the 3rd District to the year 2008. The 3 volume Systems Plan was prepared in 1988-89 for the Federal Aviation Administration and our Commission by the engineering firm of Barnard Dunkelberg and Company and Garver and Garver, Inc. The plan is a guide for aviation development in the State of Arkansas. Our airports will be linked closely with economic growth and development.

The following attachments show:

1. Planning districts composed of counties with generally common socioeconomic considerations.

2. Arkansas airports in the National Plan of Integrated Airports Systems.

3. Forecasts of general aviation operations at public use airports. Those in the 3rd District are identified by county. These projections are based on population growth trends, number of commercial air operations for passengers and freight, and general aviation needs.

4. A record of state funds provided to airports in the 3rd District over the past five years. These funds are derived from Sales Tax on aviation fuels and aviation related products. No funds are received from General Revenue.

Page Two

Problems: In general, the counties in north and west Arkansas are in far better shape in their local participation in airport development than most other areas of the state. The problem, common to all is funding. In order to relieve some smaller communities of cash burdens, the Arkansas Aeronautics Commission has accepted "payment in kind" - the use of local city and county road and other equipment, as qualifying on a 50-50 basis in lieu of cash payment. Terrain features in northwest Arkansas are also a problem in some communities when developing or improving an airport. A current example in the 3rd District of these problems is the development of an airport at Marshall in Searcy County.

Sincerely,

Fred Davison

Fred Davison, Chairman
Arkansas Aeronautics Commission

Comments at Public Works and Transportation Committee

Springdale, Arkansas
September 8, 1990

Chairman Anderson, Congressman Hammerschmidt, and other members of the Public Works and Transportation Committee I want to thank you for conducting this meeting here in Northwest Arkansas and providing me and others an opportunity to comment on the infrastructure and public works needs which we face.

Northwest Arkansas is the fastest growing area in the State with Benton and Washington Counties ranking first and second in the percentage of growth since the 1980 census. In spite of the urbanization of the area, Washington and Benton Counties are ranked first and second in the dollar value of agricultural products produced in the State and Washington County recently ranked 41st among all counties in the nation in that category. Washington County is the nation's #1 poultry producing county, making it our largest industry with tourism ranking second. The result of this is that we have a rapidly growing area which places increasing burdens upon our public services and infrastructure. Our tax base is unable to generate the revenues needed to maintain existing infrastructure and to make necessary expansion to keep pace with this growth.

It is critically important to the area that we build a transportation network, develop water and waste water systems and solid waste disposal facilities to meet our expanding population growth. The point has been often made that Washington and Benton Counties is one of the most populated urban areas in the nation which is not connected by a 4-lane highway to the interstate system. One notices this more in this area because of the large trucking industry and the additional truck traffic generated by the poultry, swine and cattle industries. It is important that efforts continue to bring about the completion of Highway 71 from the Missouri border to Alma at the earliest possible date and to eventually tie it into the Interstate 49 system North and South. Also, the upgrading of U. S. 412 providing an important East/West link-up should proceed as rapidly as possible.

In addition to interstate-type routes, it is important not to overlook the need to maintain and upgrade our network of county roads and city streets which provide access to the interstate routes. Benton and Washington Counties rank first and second among the counties in the State in the number of miles of county roads. This fact alone presents us with a major challenge but is compounded by major traffic consisting of feed trucks, milk trucks, live-haul trucks and logging trucks, the weight of which often approach and exceed the 80,000-pound load limits. This requires that our roads and bridges be built to the highest standards to stand up under this kind of traffic. Washington County has 644 structures spanning water courses with 165 bridges of 20' in length or longer, 37 of which are either functionally obsolete or structurally deficient and in need of replacement. As you can see, we face a continuing struggle to maintain and upgrade our system of local roads and bridges and do everything possible to utilize methods and designs that will get the job done in the most cost-effective manner.

Perhaps the infrastructure need we have which could reach crisis proportions almost overnight is our means to dispose of solid waste which is generated in this area. The scenic mountainous area has its problems when it comes to disposal of solid waste. Our clear mountain streams and scenic rivers are limited in their capacity to absorb treated waste water and nutrients from agricultural run-off and landfill operations. The soil types in the area and fractured limestone formations underlying much of the area make it difficult to site landfills which can be operated in a manner safe to the environment.

Municipal solid waste generated in the 4-county region including Benton and Washington Counties stands at 482 tons per day in 1990 and is projected to increase to 600 tons by the year 2000 and 670 tons by the year 2010. Development of a solid waste management plan and cost projections are made more difficult because of the limbo we are in awaiting the adoption of final EPA regulations.

Current permitted landfill capacity in the area is less than two years. Plans for solid waste disposal including maximum recycling and waste stream reduction is anticipated to be extremely costly and may only be accomplished after considerable effort and some local opposition.

Another infrastructure problem in which we are encountering is the need to develop water systems to provide suitable drinking water to a rapidly growing rural population in Washington County. We recently received assistance from the Arkansas Industrial Development Commission, a state agency, and from the Farmer's Home Administration to put in water systems to serve nearly 1,200 households, many who were formerly served by wells that had become contaminated or had to haul water from springs which have become increasingly contaminated. As water lines are extended and our transportation network improved, we can anticipate increasing growth in our rural population which will in turn put additional demands on these systems.

We all realize the importance of economic development, job creation, and expanding employment rolls but this can only be done if we have a corresponding development and expansion of our infrastructure and public works system. Through good fortune we are blessed with a large number of entrepreneurs and innovators and people with the vision to bring about economic development and generate the kind of jobs necessary to support a high quality of life which we enjoy here in Northwest Arkansas.

We intend to do our part to address the infrastructure problems I have outlined and I am firmly convinced that by forming a partnership with the State of Arkansas and our federal government, we can properly maintain and expand our infrastructure as needed. It is unfortunate that our nation faces huge budget deficits and an enormous national debt. I appeal to the Committee to recognize the infrastructure needs here and across the United States, keeping in mind that increasing mandates to local governments without supplying the necessary financing creates considerable hardship. Any move to eliminate the deductibility of local taxes on federal income tax returns will only compound the problems we have locally in generating sufficient revenues to meet our infrastructure and public works needs.

The release of highway trust fund monies could help greatly and a formula for distributing federal highway funds including public transit funds more in line with what is generated by Arkansans would certainly be looked upon with great favor.

This concludes my comments and I again want to thank the Committee for this opportunity.

Respectfully submitted,

Charles A. Johnson

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
UNITED STATES HOUSE OF REPRESENTATIVES

CONCERNING THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

FIELD HEARING IN SPRINGDALE, ARKANSAS

September 8, 1990

Mr. Chairman and Members of the Committee:

Good morning. I am very pleased to be here today to discuss infrastructure needs and related issues pertaining to our nation's highways and bridges, and specifically to the State of Arkansas. The Federal Highway Administration (FHWA), as well as the Department of Transportation, has been examining infrastructure needs for several years and thoroughly reviewed the excellent final report of the National Council on Public Works Improvement which this Committee discussed in hearings in 1988. Since that report Secretary Skinner's National Transportation Policy deliberations have also examined infrastructure issues.

Our host Congressman John Paul Hammerschmidt stated in this Committee's May 1989 infrastructure hearing, "The development of infrastructure to support economic growth is crucial to the development of any area, and there is a legitimate role for the

Federal Government to play in ensuring that all regions of the country are able to utilize their resources, develop the necessary infrastructure, and learn to bring about their own expansion and development."

During development of the National Transportation Policy many participants in the Department's outreach process expressed concern about the state of repair of highways, bridges, and other facilities in the transportation system. As Americans have increased their reliance on highways for both passenger and goods movements, the highway infrastructure has deteriorated faster than originally anticipated. Transportation planners and engineers point out that much of the Nation's highway infrastructure, including pavement and bridges, is nearing the end of its economic service life and needs major rehabilitation or replacement. For example, according to Federal Highway Administration statistics, approximately two fifths of the Nation's 577,710 automotive bridges as being deficient.

Many of those who participated in the outreach process share the view that the condition of the transportation infrastructure has a direct effect on U.S. productivity. An economist with the Federal Reserve Bank of Chicago cited data suggesting that higher levels of investment in infrastructure of all kinds are associated with higher rates of productivity growth. He compared the United States to Japan, a country that has made large investments in infrastructure and has experienced high productivity growth. However, he and others cautioned that many other factors influence productivity and that more evidence is needed to understand when and how public and private infrastructure investment can help improve productivity on a national scale.

Americans recognize the value of the investment the Nation has made in transportation facilities, and the importance of getting the most from that investment before spending to create new capacity. Throughout America, people insist that we, as a first priority, maintain our vast transportation systems. They have ideas for methods their communities, transportation operators, and transportation users could make better use of the existing transportation system - for example, by using suburban parking lots for park-and-ride commuting, adopting flexible work-hour schedules, synchronizing traffic signals for more efficient traffic flow, improving transit schedules and encouraging greater transit ridership and giving preference to high-occupancy use of railroads. They have growing concern for the often negative environmental impacts of transportation, and they wonder about our seeming neglect of research and development in the face of exploding world technology.

Many participants in the outreach process stated their belief that the United States as a society has not given sufficient emphasis to our transportation infrastructure. Estimates of total future transportation investment are difficult to make since needs vary widely, depending particularly on the different assumptions underlying the projections, but all of them exceed current levels of spending. Those who participated in the outreach do not expect these needs, whatever their level, to be filled by a single, all purpose source; rather, a variety of public and private sources for financing transportation improvements were mentioned.

Allow me to briefly address factors affecting highway needs. Estimates of needs must consider travel trends, condition and performance of the highway plant, and current and projected spending on the Nation's highways.

Travel. Travel has returned to its historic pace following the decline resulting from the oil crisis of 1979. Total vehicle miles of travel (VMT) increased by 4.0 percent from 1988 to 1989. The annual growth in travel to the year 2005 is expected to be in the 2.0 percent to 3.0 percent range.

Condition. During the late 1970's and early 1980's, pavement conditions on our Nation's highways declined noticeably. This trend was reversed with the passage of the Surface Transportation Assistance Act of 1982. Pavement conditions improved dramatically on all systems in the years immediately following the passage of this Act. In recent years, such improvements have slowed, particularly on the higher systems. The most recent highway needs report shows that in 1987 a little over 11 per cent of Interstate pavements was rated as "poor." All other systems showed slight improvement for the same period.

Performance. Continued growth of travel is causing increased peak-hour congestion on the Nation's highways, particularly on Interstates and other arterial highways in urbanized areas. In urban areas, the per cent of travel under congested condition on the Interstate system increased from 61 per cent in 1985, to 65 per cent in 1987. Increased congestion was also reported on other arterials. The length of peak-period, or "rush hour" is becoming longer in most larger urban areas, and the number of urban areas experiencing congestion is increasing. Accident fatality rates for urban routes have decreased but not for rural arterials. The cost of highway travel has decreased by an estimated one per cent from 1985.

Finance. Total estimated spending for highways by all units of government exceeded $68 billion in 1988. Highway capital expenditures for all highway and bridges are estimated to be nearly $35 billion. The constant dollar growth in capital disbursements averaged almost 6 percent annually from 1982 to 1988.

The increase in real dollar investment in highways during the 1980's reversed the downward trend in pavement condition. This was due to the increase in Federal spending provided by the Surface Transportation Assistance Act of 1982 and the Surface Transportation and Uniform Relocation Assistance Act of 1987, and increased State and local government spending for highway improvements.

Highway Needs Assessments. The estimates of the current condition and needs on all non-local highways are based on a statistical sample of highways developed by FHWA and the States. (Estimates for local road conditions and needs are not included for lack of an adequate database.) Sample information includes physical and operation characteristics and investments. This information allows the FHWA to simulate overall conditions of the highway systems and in turn forecast physical condition and performance based on estimates of investments, travel, vehicle mix, and engineering standards and practice.

Monitoring highway conditions and performance is continuous, but assessment of needs is done biennially. The most recent report (June 1989) documents changes in highway conditions and capital requirements through the year 2005 to achieve varying levels of systems performance. Based on travel growth forecasts of 2 to 3 percent annually, FHWA estimates that a total of $606 to $703 billion in 1989 dollars will be needed over the period 1987 to 2005 if we are to eliminate all backlog and meet accruing needs on all non-local roads. This translates to an annual capitol investment of between $32.0 billion and $37.0 billion.

These estimates do not include the cost to complete the Interstate System, which was estimated at $16.3 billion in 1989. They also do not reflect the need to add certain additional capacity in urbanized areas outside existing right-of-ways to accommodate existing and anticipated future travel, estimated at 11,000 to 15,000 additional lane-miles of Interstate System, or their equivalent.

Periodically, the FHWA also surveys bridge conditions and estimates the cost of bridge needs. The latest survey of the Nation's 577,710 bridges classified approximately 238,357 bridges, some 41.2% as deficient (either structurally deficient or functionally obsolete). On the Federal-aid system, almost 77,192 bridges out of 274,583 bridges were classified as deficient, some 28.1% of the total. The estimated cost of eliminating all existing and future bridge deficiencies is $99.7 billion, or $5.3 billion annually. Estimated costs for Federal- aid system bridges alone is $77.1 billion (1989 dollars), or $4.1 billion annually to 2005.

Total annual highway and bridge investments on all non-local highway systems and all bridges, excluding the cost to complete the Interstate System, are shown below in billions of 1989 dollars:

	Current Spending	System Needs
Highways	16.1	32.40 to 37.0
Bridges	3.0	5.3
Total	19.1	38.3 to 42.3

To reiterate, these estimates are for total investment needs, not just for the Federal share. Additionally, these estimates do not include added urban capacity to meet current and anticipated travel demands where rights-of-way restrictions make traditional highway construction infeasible. It is estimated than an additional 11,000 to 15,000 lane miles of urban Interstate, or their equivalent, must be added above and beyond what is currently believed feasible, in order to accommodate existing and expected levels of travel demand. Non-construction measures, including demand management strategies and smart vehicle technology, among others, may be considered as a supplement to traditional highway construction to accommodate travel demands in highly congested urban areas, but these measures will not provide a total solution. This suggests that travel delay and congestion in urban areas could worsen in coming years as travel growth outpaces the provision of highway service. These levels of investment would result in an overall highway system that could be categorized as "good." These investments would improve overall 1985 physical and operating conditions, where possible, on the major highways, and improve conditions on the minor highways, and eliminate all bridge deficiencies.

The Committee asked that we specifically discuss Arkansas infrastructure problems and needs. Arkansas is among the first states to complete its Interstate system, opening their final Interstate segment in December 1982. The Interstate System in Arkansas totals 526.34 miles.

The Arkansas factor for the apportionment of Interstate construction funds has been zero since the 1983 Interstate Cost Estimate, as they have already completed their portion of the Interstate. Arkansas received $139 million in apportionments and $14 million in allocations in 1990. They still receive a minimum (1/2 percent) apportionment, which amounted to $13.5 million in FY 1991 (distributed on October 1, 1989). If these minimum funds are in excess of Interstate resurfacing, restoration, rehabilitation or reconstruction (I-4R) needs, they can be used on other Federal-aid systems. Additionally, Arkansas received $26.4 million in FY 1991 in I-4R funds (distributed on October 1, 1989).

With respect to the Bridge Program in Arkansas, of the State's 13,017 bridges, 5,821, or 45 per cent, are deficient. This is roughly comparable to the national average of 41 per cent bridge deficiencies. There are currently 5,271 bridges in Arkansas eligible for Federal Bridge Program funding.

With respect to "posting" data on Arkansas' bridges, in which the term "posting" represents a restriction on the use of a given bridge, of the State's 13,017 bridges, 4,557, or 35 per cent are closed, posted, or in need of posting. This is a bit below the national average of 27 per cent closed, posted, or in need of posting. However, with only 24 bridges closed in the State '0.0018%), Arkansas is over four times better the national average (0.0089%).

Policy Issues Affecting Needs. As we enter a new decade, the Nation must renew its commitment to maintaining its transportation system and infrastructure. The nation's economic vitality and quality of life depend on safe, efficient transportation for the movement of people and goods. Clearly, an investment in transportation is an investment in America's future.

We believe the National Transportation Policy provides a strategic framework for that national investment of time, of money, and of commitment. It shapes our thinking about the movement of passengers and goods in the 1990's and beyond. The

Policy uses a common sense approach of focusing our limited resources on systems of national significance and promoting national priorities, such as improving mobility and the efficient movement of goods, providing jobs, and improving the quality of life for all Americans.

Resources must be found to rebuild, improve and expand the transportation system. Reliance on the Federal Government to supply the majority of investment dollars is declining while the role of State and local governments and the private sector is increasing. The coming decade will likely see the forging of new partnerships recognizing the increased responsibilities and capabilities of public-private partnerships affecting mutual interests. The Secretary's National Transportation Policy recommends:

-- using the balance of the Highway Trust Fund in a fiscally responsible manner;

-- increased reliance on user fees and private sector involvement; and

-- greater State and local flexibility for program decision making.

As with the reauthorization for the Department's aviation programs, which we submitted to Congress this session, these principles will form the basis for our highway reauthorization proposal.

It is anticipated that the basic roles of the federal, state, and local governments will change to some degree in the post-interstate era. The most important change anticipated at the federal level is a reduction in the number of categorical programs and an emphasis on systems and projects of national interest. The states will continue to be the primary recipients of Federal-aid money, with some funds being passed through to local governments for their use at the states' discretion.

To help meet the needs we face, the National Transportation Policy urges greater flexibility for state and local governments to raise revenues -- for example, allowing greater use of toll financing for Federal-aid highways. We also want to stimulate private investment and to encourage joint public-private financing of facilities where appropriate. Accommodating increasing traffic demands and maintaining a reasonable performance level of the transportation system will require continuing and substantial infusions of private capital. In this context, we are considering expanding the ability to use private donations, including cash and right-of-way, for the State's share of a project; and allowing private toll roads to be eligible for Federal-aid funds, provided that such facilities could be incorporated into the Federal-State grant-in-aid process.

As our bottom line, we must ensure that there is a sound financial base to support our transportation system. The Federal government, in partnership with State and local governments, and the private sector, must see that the financial means are available to invest in America's future. While we seek to encourage a greater role on the part of the States, localities, and the private sector in the preservation and development of transportation infrastructure whose primary importance is statewide or regional, we do not propose any abandonment of the historic Federal support for transportation.

In closing, I would like to state that we are fully committed to work with Congress to address the needs of the nation's infrastructure in our forthcoming reauthorization legislation. We will continue to cooperate fully with this Committee toward this goal.

That concludes my prepared statement, I will be pleased to answer your questions at this time.

OFFICE OF THE MAYOR
CHARLES N. McKINNEY

The Honorable Glenn M. Anderson, Chairman
Committee on Public Works and Transportation
U.S. House of Representatives

To give you a quick overview of Springdale - according to preliminary census figures we grew from 23,458 in 1980 to 29,989 in 1990. A 28% increase. Our unemployment rate is in the 3 - 4% range and we have a highly diversified industrial base in spite of inadequate roads and highways. We have an abundance of water from Beaver Lake, and we have just completed upgrading our waste water disposal facilities.

If we are to continue to grow and prosper the completion of Highway 71 from I-40 to the Missouri line is a must, and just as important is the improvement of Highway 412 from Springdale to the Oklahoma line.

Air transportation has improved over the years to this area, but a regional airport is certainly needed. Local airports would continue to provide their intended purpose. Installation of radar in this area should be a priority.

I have much concern that often times regulations do not seem to follow the intent of legislation.

I have problems with mandated programs without adequate funding; i.e., Clean Water Act, as it pertains to storm water treatment; solid waste disposal; Sub-chapter D; are examples.

Infrastructure Needs-Water Quality
September 8, 1990
Springdale, Arkansas

MR. CHAIRMAN AND MEMBERS OF THE COMMITTEE

I am pleased to have the opportunity to testify before your committee to discuss water quality in the Ozark Region of Northwest Arkansas. The region has long been recognized for its beautiful mountains, high quality streams, rivers, and lakes. These features help make the area a top vacation spot and an attractive location for retirees as well.

This area is also recognized as the most rapidly growing region of our state, with much of the growth attributed to livestock and poultry industries. For some time Arkansas has led the nation in the production of broiler chickens and ranks near the top in numbers of swine, turkeys, eggs, and beef.

Because of many factors, the confined feeding operations associated with these animals are located in Northwest Arkansas. These operations offer a wide range of economic opportunities to the area and its agricultural producers, but they also present an increasing number of environmental and resource issues.

Much of the area is composed of rolling hills to mountainous terrain with steep slopes. This terrain produces rapid runoff that flows into high quality streams, rivers and lakes. The numerous water bodies that lie within the region provide water for domestic use, industrial supplies, recreation, and livestock.

The soils are predominantly shallow and are underlain by cavernous or fractured limestone which allows for the rapid downward movement of water into the underground acquifers. When animal wastes are not properly stored, altered in composition, removed from the production areas, applied to grassland, or utilized by forage plants, the movement of nutrients and organic materials into the groundwater can occur. This situation, in combination with the geologic features of the area, creates the potential for non-point source water pollution problems.

In order to maintain the stability of this region, insure continued growth of the area's industrial base, and assure the prosperity of the local agricultural producers, we must strive to achieve a balance between the economics of the livestock and poultry industry and environmental concerns associated with our water supplies.

While there are several sources of water quality degradation, correcting problems from agricultural operations is a high priority in USDA.

The problem is pervasive. Much of the drinking water for Northwest Arkansas comes from the lakes located along the White River. The Illinois River serves as a drinking water source in Oklahoma, and many private home water supply wells are located in shallow acquifers that are recharged by surface runoff. Some private domestic use wells are exceeding current Arkansas Health Department standards with respect to nitrates and the presence of fecal bacteria.

Tourism is affected also, since the Buffalo National River Park is a National Scenic River that draws approximately one million visitors annually. Other streams are just as noteworthy for their trout or bass fishing, and intrinsic recreational and aesthetic values.

Overall there are about six hundred miles of streams and rivers that have their designated uses impaired by deteriorated water quality. The resource professionals involved with water quality need to concentrate on the issues, the source of the problems, and the solutions.

The people involved with water quality in Northwest Arkansas represent many groups, governmental agencies, local entities, and industries. Despite the involvement of all these different groups, there is a unified state, federal and local effort in addressing the non-point pollution issue. The Corps of Engineers, Environmental Protection Agency (EPA), USDA agencies (particularly the Soil Conservation Service (SCS), Agricultural Stabilization Conservation Service (ASCS), and Cooperative Extension Service), along with various state and local agencies and the research efforts of the University of Arkansas, have joined with farmers to put forth programs that will reduce the non-point source water pollution coming from agricultural operations in the various watersheds.

The Beaver Lake Demonstration Project is an example of one of the programs. The Corps of Engineers will be working with EPA and SCS to implement best management practices on land where animal waste is applied. These practices will be a part of a management plan specifically designed for each producer to reduce the runoff of applied nutrients. This, in turn, will reduce both the amount of and the potential for non-point source pollution.

A second example of the cooperative effort is the Soil Conservation Service's work with bankers, livestock producers and local government officials in Carroll County to provide additional technical assistance to local farmers wanting plans showing them how to properly dispose of animal waste. These plans include application schedules, conservation practice design, and detailed soils information.

Other examples are the additional technical and financial assistance programs that ASCS, SCS and Cooperative Extension Service have provided using Special Agricultural Cost-Share programs and watershed hydrologic units. These USDA programs identify problem areas in small watersheds and then each agency works closely with the farmers helping them to plan and install best management measures that will prevent or reduce non-point source pollution. So far, over six hundred practices have been implemented in the participating four counties. Each of these programs are targeted for a three-to-five year period and are projected to reduce the non-point source pollution load from 40 to 50 percent in the streams of the Beaver Lake and Illinois River watersheds.

In addition, the SCS and other cooperating agencies have undertaken a two year study in the Illinois River Basin to identify problem areas and recommend solutions and alternatives to current situations. This study will be completed in 1991.

We must not forget that the economic stability of this region depends on livestock and poultry industries. Cash receipts from the marketing of livestock and poultry in Arkansas amounted to $2.565 billion dollars in 1989, with the bulk of this revenue produced in Northwest Arkansas. Four counties in Northwest Arkansas have ranked in or near the top ten in total dollars of agricultural products sold in Arkansas, with Washington County number one, and Benton County number two. Total agricultural output in Benton County was valued at $196,000,000 during 1989.

In a seven county area in Northwest Arkansas in 1989 there were 425,816,000 broiler chickens, 258,000 hogs, 410,100 beef cattle, 19,062,000 turkeys, and 24,000 dairy cows. A comparison of the growth in the livestock and poultry industry for this seven county area from 1979 to 1989 shows dramatic increases in overall production levels.

It is also evident when looking at the production figures, that animal wastes and their disposition are becoming increasingly important in the overall picture of agriculture in Northwest Arkansas. In excess of 16 million tons of manure and waste products are being generated each year in the region. These waste materials require approximately 400,000 acres of pastureland for the proper land application of the wastes, and thereby create additional challenges for producers, landowners, and industries alike.

A continuing partnership of all those involved in resource management will be needed to address and deal with the water quality issues and economic development needs of Northwest Arkansas. The Clean Water Act's Clean Lakes Program and 319 Program, the Water Resources Act, and USDA's water quality projects are all exceptional programs that can help to address the water quality issues facing Northwest Arkansas.

In addition, the state has a pollution abatement bond program that can help fund needed improvements in existing waste systems. Local officials, industry representatives, farmers, and government officials are cooperating and interacting with all of the available federal programs in an effort to address the challenges and opportunities being created within the water quality arena.

The participants are also evaluating new technologies, trying new types of conservation practices, and expending more research funds to develop viable solutions to the resource questions.

The problems found around Beaver Lake and its tributaries are spreading, and the Table Rock Lake Watershed is now experiencing many of the same problems. While many problems exist, I am confident that a sound balance between economic prosperity and environmental concerns can be achieved. Programs and technology are in place, or are being developed.

In time, they can effectively reduce the problems through good administration and cooperation.

Thank you again, Mr. Chairman, for the opportunity to discuss water quality in Northwest Arkansas.

STATEMENT TO COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

ANALYSIS OF MUNICIPAL INFRASTRUCTURE NEEDS
SPRINGDALE, ARKANSAS, SEPTEMBER 8, 1990

BY JERRY MONTGOMERY, MAYOR
CITY OF MENA, ARKANSAS

Mr. Chairman and members of the Committee, I'm Jerry Montgomery, Mayor of the City of Mena. Mena is located in west central Arkansas having a population of 5,500 with an estimated trade area of 25,000. On behalf of myself, the city council, and all the citizens of Mena, I sincerely express our gratitude for the opportunity to appear before this distinguished committee. I also want to express our appreciation to each of you for taking the time from your busy schedules to come to northwest Arkansas and listen to individuals, like myself, voice some of the problems of our region of the United States. It is indeed gratifying to see your interest and presence here today.

I will specifically address the four most important infrastructure needs that currently effect our city and region of the state economically: highways, airports, water and sewer supply and treatment, and solid waste disposal.

Mena is one of the growing cities of northwest Arkansas, as shown by the recently released preliminary census figures. Mena has grown by approximately 6% since 1980; even though, we are located 80 miles from the nearest interstate or improved four lane highway. The western side of Arkansas was excluded in the development of a four lane interstate program, and this has had an adverse effect on our industrial growth because of an inadequate transportation system through our region of the state. We strongly support the extension of Interstate 49, which is proposed from Shreveport, Louisiana to Kansas City, Missouri. The construction of this interstate will provide 11 mid-America states with a quality highway from the Gulf of Mexico to the Canadian border. Studies have show that the 11 states this highway will serve comprise over 22% of the nation's population, and this highway will fill a 500 mile void between I-35 and I-55 for north-south highway transportation.

We feel that it is imperative that the Federal Highway Trust Funds be kept intact and urge they be used for such highway improvements as Interstate 49 or an improved U.S. Highway 71. In our area of the state, tourism, which effects our local economy by creating thousands of jobs, is highly dependent upon quality highways; not to forget the transportation needs of such companies as Wal-Mart, J.B. Hunt trucking, and Tyson Foods.

Mena's Airport is among the busiest airports in the State of Arkansas, not in passenger traffic but in the service industry, as it relates to aircraft maintenance. We have a world wide reputation for quality and fast turn around in aircraft maintenance. The industries, located on the airport, employ just over 225 people with an annual payroll of approximately $2.5 million, having annual gross sales of 11 million (3 million is foreign sales); however, we are in extreme need of a new 6,000 foot east/west runway with an ILS system to accommodate not only the needs of the 12 existing companies, but the future needs of two large aircraft industries interested in locating at our airport. The economic development at the airport is limited by the lack of an adequate precision instrument runway. If built, in excess of 350 new jobs would be created which would significantly improve the economies of not only Polk County, but the surrounding counties comprising approximately 50,000 population. These new jobs with related services represent an economic impact of greater than $25 million annually. We are convinced, with our current lack of close access to a four lane highway system, that we must further develop the airport in our region of the state, if we are to grow economically and provide the quality jobs for our young high school and college graduates who now must leave our area to seek a better life. Again, we implore the Congress to keep the Airport Trust Funds intact and ask that these funds be used for such improvements as the needed expansion of airports for economic purposes.

With the assistance of EDA & FmHA, we recently completed a badly needed water system which saved approximately 250 jobs from being lost due to a lack of water. Presently, many of our cities, Mena included, are in need of making improvements to their waste water and antiquated sewer systems to come into compliance with Federal EPA regulations. Many of us are currently under a Federal Administrative Order to "Clean'em Up", as we all know, this takes large sums of money. Mena, like many cities in Arkansas, has been willing to tax themselves with a 1-cent city sales tax to accomplish many of these needs without asking for any grant assistance from the federal government. More recently, Mena and Polk County residents passed an additional county-wide 1-cent sales tax with the bulk of the City's share of these funds to be used for water and sewer improvements. However, it will be necessary to utilize the low interest loans made available by FmHA for these projects, as well as, grants that are currently available from state and federal sources. Therefore, we would encourage that loan and grant funds continue to be made available for these necessary improvements; not only to help create new jobs, but to save existing jobs.

Finally, most every city in this region of the state is facing the "real" problem of solid waste disposal. Mena is currently shipping it's waste (after recycling) to the nearest landfill located 80 miles away at a tremendous cost to our citizens, and the expense is becoming more costly by the day. We would respectfully ask that all consideration be given by the Congress to assist rural America in helping us in anyway possible to develop an acceptable environmentally safe solid waste program that we can afford.

I will sum up by saying that all existing federal funding for infrastructure programs must be kept intact. I sympathize with the plight of Congress in the reduction of the national debt and agree with the Graham-Ruddman Act enforcing a balanced budget to include a strong military posture, which is essential for the protection of our country; but we, as mayors, must continue to seek federal assistance for our local infrastructure needs.

In closing, I want to thank Congressman Hammerschmidt for the opportunity to appear before you and for bringing you to the most beautiful part of the State. I hope you enjoy your stay.

STATEMENT BEFORE

THE HOUSE PUBLIC WORKS & TRANSPORTATION COMMITTEE
INFRASTRUCTURE PUBLIC HEARING
SPRINGDALE, ARKANSAS

Relating To

AN OVERVIEW OF ARKANSAS' HIGHWAY INFRASTRUCTURE NEEDS

By

RAYMOND PRITCHETT
Chairman - Arkansas Highway Commission

September 8, 1990

AN OVERVIEW OF ARKANSAS' HIGHWAY INFRASTRUCTURE NEEDS

Arkansas is at a critical point in terms of highway transportation. The gap that exists between highway revenues available and the magnitude of needed highway improvements must be addressed.

A needs study nearing completion indicates that, due to higher traffic volumes, heavier loads, and its age, the highway system will experience rapid deterioration in the upcoming years. This is a major issue for a state which ranks first in the nation in the number of miles driven per vehicle. Briefly summarizing, the findings include:

- The utilization of the state's highways is increasing each year. However, because of increasing vehicle fuel efficiencies, revenues generated from the tax on fuel purchases - the Department's primary funding source - have remained relatively constant over the last ten years.
- Almost one-half of the State Highway Revenues are currently required to maintain the system. This will grow if the construction program is not increased.
- In evaluating the previous and current inventories of the condition of the highway system, it is apparent there has been deterioration in the overall pavement condition. A higher percentage of the state's roadways

are now in the poor category.

- An examination of the Department's current construction spending pattern and the expected deterioration of the highway system due to projected traffic volumes indicates that funding will not be sufficient to keep pace with deterioration over the next ten years.

While the Department has been able in the past to make progress on major corridors throughout the state, the study indicates that the ability to emphasize corridor-type improvements in the future will be curtailed by the need to preserve the overall highway system.

Nevertheless, we hear more and more from community leaders that adequate four-lane arterial highways are essential for continued economic expansion. Numerous studies by the Department and others have demonstrated the need for more four-lane routes in the state. These corridor improvements will not only allow expansion of existing industries, but will also attract new industries, create new employment, and stimulate rural trade growth which in turn will provide critically needed tax revenues that ensure funds for the health, education, and general welfare of the state. A good example is the need now being presented by the Northwest Arkansas Council for improvement in Northwest Arkansas.

Recognizing these benefits and having the ability to pursue them are unfortunately sometimes far apart. In terms of Federal-Aid Highway funds, Arkansas has traditionally been a "donor" state. The State is currently receiving only 72 cents in Federal-Aid Highway funds for each dollar that Arkansas motorists contribute into the highway trust fund in the form of Federal fuel taxes and other Federal Highway User fees. In addition, Arkansas contributed $14.5 million to the Mass Transit Trust Fund in 1988 and only received $600,000 back. The bottom line is that Arkansas sends approximately $73 million per year to Washington than is not returned. With ever-increasing highway and bridge needs, the State can no longer afford to heavily subsidize other states' programs.

In 1991, Congress will write legislation to continue Federal funding to improve our nation's highways and transit systems. It is imperative that a change in the allocation method be made during this legislative process.

Until a change is made, the law as now written further penalizes donor states when receiving additional Federal aid funds for needed projects. The penalty takes the form of reduced minimum allocation funds. The most recent example of this was the reduction in Arkansas' highway funds in an amount equal to emergency relief funds obtained as a result of flooding earlier this year. Special provisions in the legislation should be included so that any special funding will not take away from other projects now being readied for construction in Arkansas.

In addition, as long as the highway trust fund is kept "on-budget" and subject to the Gramm-Rudman-Hollings provisions, Federal aid funds are not a reliable source for essential highway improvements. It is estimated that Gramm-Rudman-Hollings may reduce Arkansas' funds by as much as $50 million in the upcoming fiscal year.

Another issue of concern to the state at this time is the possibility that many of the statewide corridors that have been identified for expansion may not be on the proposed National Highway System. The administration's proposal as it now stands will leave many of Arkansas' major routes off the National Highway System. This will cause the remaining major routes to compete for secondary-type federal funds or state funds that will be needed on the existing highways to prevent further deterioration. Since the size of the system and the distribution of funds are not tied together, each state should have flexibility in determining the National Highway System size.

We also believe that some emphasis should be placed on diesel fuel consumption in the apportionment formula. This would take into consideration the wear and tear of large concentrations of heavy trucks.

Some other issues of concern from our review of the highway reauthorization proposal and general comments are as follows:

- The proposal contains no mention of the split in funds between the National Highway System and the urban/rural system. We believe a 50-50 ratio would be appropriate with provisions for transferring up to 20%

between systems.

- The revised apportionment process for the bridge program based on level of service needs to be carefully examined. Traffic volumes alone should not be used. The current method based on square foot of need seems more appropriate. Also, the Federal share for this program should be 80% and not the variable rates as proposed.
- Any increase in motor fuel taxes should not be used for budget deficit reduction.
- The present weight and length limits for trucks should be retained.

With careful consideration by Congress of these major issues combined with efforts at the state level to provide additional funding, we believe a new highway program can be developed over the next few years that will expand services in both rural and urban areas and, at the same time, allow for reconstruction and resurfacing of existing routes. This program must be funded by both additional federal funds and additional state funds if the needs on our existing highways are to be met and the timely completion of improvements to major statewide corridors achieved.

Two such major corridors which will require significant investment for timely completion are U.S. 71 and U.S. 412 in northwest Arkansas.

HIGHWAY U.S. 71

The Arkansas Highway Commission has long recognized the need for providing improved access from I-40 north to the Fayetteville area.

Rapid growth and development in northwest Arkansas during the 1960's created excessive traffic demand on the arterial highway system. The Commission, in recognition of the need for improved highway facilities, authorized two studies which established the need for a north-south freeway or expressway to serve the inter-urban and regional traffic.

The **Northwest Arkansas Regional Transportation Study**, authorized by the Commission in 1968, was prepared in cooperation with the Northwest Arkansas Regional Planning Commission and the local jurisdictions in Benton and Washington Counties. This study documented the need for an additional north-south principal arterial in Benton and Washington Counties to meet future traffic needs. The **National Highway Functional Classification and Needs Study** in 1971 indicated the need for a principal arterial on new location connecting the Fort Smith-Van Buren urbanized area and the Fayetteville-Springdale-Rogers urban area and northerly to the Missouri Line.

Following up on the recommendations of these studies, the Commission, in 1971, authorized the Director to conduct a preliminary engineering study including aerial photography to determine the most feasible location for a new highway within the corridor on the basis of road user benefits, improvement costs, safety, stage construction and environmental impact.

In 1972, a study identified four alternate routes. Engineering studies to determine the most feasible route design were undertaken, and in early 1973, meetings were held in Van Buren and Fayetteville to discuss the various alternates. At Fayetteville, opposition for a highway on new location between I-40 and Fayetteville was voiced. In fact, no one spoke in favor of this type highway. Following this display of local opposition, work on the section of highway from Fayetteville south was suspended until 1983.

Since the traffic demands were considerably higher between Fayetteville and the Missouri Line and because this project would stand on its own merit regardless of what took place south of Fayetteville, the decision to divide the project into two phases was made, and work began in earnest on the northern segment. An Environmental Impact Statement was prepared in early 1976 and a public hearing to discuss alternate routes and design was held in Springdale in June, 1976. The project was subsequently approved, design work completed and construction began in 1981 with the first new location section from the Fayetteville bypass to Elm Springs Road.

Since then over $117 million (including Right-of-Way and Utilities) has been spent constructing this route, including work on the Fayetteville Bypass.

The Fayetteville-Springdale area is an urbanized area with over 50,000 population and one of the few urbanized areas in the United States which are not connected to the

Interstate System by a four-lane divided highway. In 1983 the Commission authorized the Director to seek special funding for connecting all urbanized areas to the Interstate System with four-lane divided highways. On October 31, 1983, the Director requested that the Federal Highway Administration designate of Highway 71 from I-40 at Fort Smith to the Missouri State Line as part of the Interstate System.

The Federal Highway Administration notified the Department on November 22, 1983, that the segment from I-40 at Fort Smith to Highway 71 Business route at the north terminus of the Bypass at Fayetteville would qualify for designation as an Interstate route when constructed to full Interstate standards. (Extension of the route to the Missouri State Line would only be warranted if it was possible to achieve a northern connection to the Interstate System in Missouri and the State of Missouri requested it.) Such designation did not create any additional federal funds for construction of the route. Also, the route must be constructed to meet all standards of an Interstate highway and shall be constructed within 12 years of the date of the agreement between the Secretary of Transportation and the State.

On March 9, 1984, Federal legislation permitted the use of Interstate reconstruction funds to construct highways designated as Interstate routes to Interstate standards. Consequently, the Commission targeted part of these funds to complete the construction of Highway 71 as an Interstate-type facility by 1995.

Since 1984, Environmental and location studies have been completed and work has begun on the section from I-40 to Fayetteville. Over $60 million has been spent for purchase of right-of-way, utility relocation, and roadway and bridge construction. Work is now underway from I-40 north approximately 7.3 miles and from Greenland to the Fayetteville Bypass (approximately 3.8 miles).

Current estimates are that an additional $180 million will be required to complete this work. Under present conditions, it will be difficult, if not impossible, to meet previously established schedules without significantly increased federal funding levels. Other Interstate reconstruction needs limit the amount of those funds that are available to this project and the $7.2 million annual Demonstration Project allocation will obviously not allow quick completion of this highway.

While the Senate Appropriations Committee's plan to increase by $10 million the 1991 allocation for this work is encouraging, the Highway Commission is also pursuing non-federal solutions to this problem. A private consultant has been retained to evaluate the feasibility of constructing several routes in Arkansas, including Highway 71, as toll roads. This study is now in the initial phases and should be completed by later this year. It's recommendations could have an impact on future construction schedules for Highway 71. Also the Commission is preparing a new highway funding proposal for presentation to the Arkansas Legislature in 1991. Unfortunately, the current unrest in the Middle East has caused the presentation of this program to be put on hold until the impact of this situation can be adequately assessed.

Arkansas' goal of completing Highway 71 has been clear from the 1960s through the 1987 endorsement of this section as part of the I-49 route stretching from Shreveport, Louisiana to Kansas City, Missouri. However, it is equally clear that additional funds, either federal or state, must be available to achieve this goal in a timely fashion. Any additional federal funds should be made available in such a manner that it will not take away from existing federal programs.

Another major corridor needed to serve rapidly developing northwest Arkansas is U.S. 412.

HIGHWAY U.S. 412

According to the preliminary census data, Benton and Washington Counties grew by 24.1 and 13.5 percent, respectively, between 1980 and 1990; the cities in this area grew at even faster rates. For example, the populations of Springdale and Bentonville both grew by more than 27 percent and Rogers enjoyed the second highest growth rate in the State with almost 40 percent growth during these ten years. Much of the growth in this area has been fueled by the opening or expansion of numerous industrial plants and by the corporate offices and the peripheral support businesses associated with the headquarters of such major concerns as Wal-Mart, Tyson and Jones Truck Lines. The educational opportunities offered at the University of Arkansas campus in Fayetteville along with the excellent quality of life in this area have also contributed to much of this growth. With all of the available evidence pointing to continuing rapid growth in this major metropolitan center, it is apparent that significant highway improvements will be required to meet regional transportation needs.

The immediate need in the Siloam Springs-Springdale corridor is to provide a partially access controlled, four-lane facility. Highway 412 is a principal arterial connecting the fast-growing Northwest Arkansas urbanized area with Tulsa, Oklahoma, and ultimately the major Interstate routes to the West such as I-44 and I-40.

Once the planned four-lane toll facility adjacent to U.S. 412 in Eastern Oklahoma is completed in late 1991, the segment of U.S. 412 between Springdale and Siloam Springs will be the last remaining two-lane link between the Northwest Arkansas urbanized area and Tulsa. To the East, U.S. 412 provides the only east/west arterial across Northern Arkansas, serving recreational areas, retirement communities, and the rich Delta farm land in Northeast Arkansas. It also crosses the Mississippi River on the only highway bridge between Memphis, Tennessee and Cairo, Illinois. Because of its strategic importance to the northern half of

Arkansas, the U.S. 412 route has been studied in great detail and the findings were reported in the 1988 publication entitled North Arkansas East/West Corridor Transportation Study. As a result of this study, many miles of widening improvements and additional climbing lanes are planned on the existing facility east of Springdale as funds become available. The immediate need for improvements to U.S. 412 between Springdale and Siloam Springs is demonstrated by the high average annual daily traffic (AADT) volumes, the geometric deficiencies of the existing highway, and the resulting high accident rates. The current AADT volumes along this route vary from 8,600 on the eastern end of this segment to about 6,000 near the center. Traffic volumes are expected to show substantial increases over the next twenty years with Year 2010 volumes in the 10,000 to 13,000 range with trucks comprising about one-fifth of the total traffic. This high traffic volume will cause serious safety problems and intolerable delays to motorists on the route.

The geometric deficiencies for this twenty mile segment have been analyzed and it was found that seventeen grades are in excess of the recommended range for this type of facility and terrain. Also, twelve sharp curves must be negotiated along this segment. The heavy traffic volumes, along with the slower moving trucks and the limited opportunities to pass result in poor and unsafe operating conditions.

The accident data for this route also points out the need for improvement. Two hundred and forty accidents have occurred on the segment during the last two years. A single one-mile segment in the last three years has had fifty accidents due to inadequate sight distances and sharp curves. Because of adjacent development and numerous residences along the poor existing alignment, very little can be done on this route to eliminate many of the highway safety deficiencies. Accident rates have averaged 3.63 accidents per million vehicle miles along this route which is more than twice the statewide average of 1.74 for two-lane rural highways.

Because of the documented need for this facility, the Arkansas Highway Commission has placed special emphasis on the upgrading of this twenty mile segment. By Minute Order 89-462, the Commission authorized surveys, plans and construction for a four-lane divided, partially access controlled facility located on new location. Although the priority of this route is well established, the fact remains that this project is estimated to cost $60 million and cannot be completed within an acceptable period of time with the limited funding resources available.

Recognizing the importance of this route and the funding limitations, Highway 412 was also included in the Department's toll road study. If it is not feasible to construct this route as a toll road, it may take the Department up to twenty years to complete the upgrading of this twenty mile segment because of the State's current limited funding resources--even though the need for this project is evident today.

SUMMARY

The future adequacy of Arkansas' Highway System depends on a joint State and Federal alliance. Arkansas must be removed from the "donor state" position and sufficient federal funds and federal system mileage must be available to support not only statewide corridors, but also the feeder routes that are so important to agricultural and industrial vitality.

Also, the current laws must be revised to prevent penalizing those states that are classified as "donor states" when receiving additional federal funds for emergencies or other special projects. In addition, the Highway Trust Funds must be removed from the budget balancing process.

With changes at the federal and state level and continued support throughout the state from groups such as the Northwest Arkansas Council, a progressive cooperative program for highways can be realized.

Statement by

James R. Rodgers

Airport Manager, Little Rock Regional Airport

before the

Committee on Public Works and Transportation

United States House of Representatives

September 8, 1990

#1 Airport Drive
L.R. Ark. 72202

Good morning ladies and gentlemen. I would like to thank you for inviting me to speak at your Committee hearing to comment on the future infrastructure needs of Arkansas, as they relate to airport development.

For many a visitor to Arkansas, the Airport delivers the first impression of our state. The Airport is one of the most visual and tangible links in reaching beyond our borders. The business traveler, the increasing number of convention goers, the "Natural State" vacationers are all impressed with what we have to offer. The presence of quality air transportation is a state attribute. But the Airport also serves as the backdrop for another thriving economic force.

Beyond the Airport, business leadership believes strongly that a growing Arkansas airline industry provides a catalyst for other opportunities that benefit the entire community and state. Our commitment to the future is evident with our long-term capital improvements to accommodate projected increases in air traffic. In the next year alone, almost 25 million dollars will be spent on improvement projects already under construction. Two of those projects will be the completion of a new 60 million dollar parallel runway that is expected to be operational in the spring of 1991 and the completion of a new 45 acres campus for our tennant British Aerospace in the summer of the same year.

But, our capital improvement plan doesn't stop there. We project our needs for the next ten years to be in excess of over 50 million dollars to meet the ever increasing demands that are placed on our facilities. New and expanded access roads will be needed, land will have to be acquired, maintenance of existing and construction of new runways, taxiways and air craft parking aprons will be required.

I believe that now is a particularly appropriate time to reflect on the commitments that must be made by the various entities involved with providing a strong and healthy environment essential for the continued growth of aviation.

The various entities that must provide total support are:

1. Federal Government: We must continue to see responsive as well as responsible legislation out of Washington, such as the most recently passed Reauthorization Bill which now includes Passenger Facility Charges. Nothing is more frustrating to those of us in the industry than to see a doubling of the number of people we serve (this has happened within the last ten years), experience strains on the system; both in the air and on the ground, know that funds are being collected and yet not made available to significantly reduce this ever increasing demand. The amounts approved in H.R.5170 for airports improvements, modernization of the airways system, research and development; and FAA's operations and maintenance is never enough, but they certainly are much more realistic and given the ability to assess PFC, they go a long way toward meeting the nation's need for increased aviation capacity.

The Federal Aviation Administration must also continue to be sensitive to the various needs of individual communities and how each need must address community concerns but also fit into strengthening the overall aviation system.

2. State Government: The state agencies interested in promoting aviation development must understand that it goes beyond just economic development for a given community. It also requires responsible legislation and dollars to construct, expand and maintain facilities. The right legislation can be fashioned into an extremely useful tool to help local cummunities become more attractive in encouraging new entrants into a market.

3. Local Governments and Authorities: The new voluntary charges and increase in appropriations (if approved) is the beginning of an opportunity to provide first class facilities for those living and visiting our communities. The traveling public deserves the best airways facilities system that we can provide.

The entities involved have made considerable progress in achieving this system, and it is in our power to further consolidate this progress. Thank you.

(501) 273-9642

Honorable John Paul Hammerschmidt
and members of the Committee on
Public Works and Transportation:

A strong basic infrastructure is vital to the economic base of this area. As we all know, Northwest Arkansas is accelerating in the areas of agriculture/industry and recreation. Therefore, it is necessary for this state to provide sound highway systems and sturdy bridges to keep commerce rolling.

As most of you well know Northwest Arkansas is one of the fastest growing areas as shown by the 1990 census. This contributes to the increased needs for highways, bridges, rural water and solid waste disposal.

I feel there are two significant needs for 4 lane limited access highways in Northwest Arkansas. First, being U.S. Highway 412 between Siloam Springs and Tontitown. This would link U.S. 412 with the soon to be completed Cherokee Turnpike. I think the increased traffic on U.S. 412, an already dangerous hwy, will be shocking once the Cherokee Turnpike is completed Spring 1991. This will cause a tremendous bottle neck effect on Hwy. 412 at the Arkansas - Oklahoma State Line.

Such a project as this meets funding and programmatic criteria by the utilization of user fees, the improvement of hwy. safety, the relief of hwy. congestion, the provision of rural access and the development of an efficient intermodel link to the Port of Catoosa on the McClelland-Kerr Arkansas River Navigation System and the proposed NWA Reliever Airport.

Secondly, the rapid completion of Highway 71 to an interstate type Highway linking Interstate 40 and Interstate 44. This will enable us to connect with other commerce area. The accident and death rate on both Hwy. 71 and Hwy. 412 is already astonishing.

I would like you to consider supplementing annual funding by initiating legislation to spend down the hwy. trust fund balances. This would provide Arkansas additional funding which I feel we are entitled.

The burden of providing for the collection and disposal of America's solid waste is a pressing concern of local governments all over our area and the burden in growing.

While we agree solid waste must be disposed of in an environmentally safe and ecologically sound manner, the local governments need additional resources made available to help solve the current and future problems of solid waste disposal.

Because of our rapid growth and increased population with rural subdivisions there is an extreme need for rural water systems to insure safe water.

I want to take the opportunity to thank the Committee for asking me to participate in today's hearing. With the exchange of ideas and your interest in our community, we should sufficiently handle any situations that arises to link our growing area to the major arteries of the working world. We need to keep in mind that increased growth, adds to the stress of our current installation. We must work together to continue safely.

Respectfully yours,

Bruce Rutherford
Benton County Judge

ADDRESSING THE INFRASTRUCTURE CHALLENGES OF THE CITY OF ROGERS AND NORTHWEST ARKANSAS

A Presentation to the
Committee of Public Works and Transportation
One hundred first Congress
U. S. House of Representatives
Glenn M. Anderson, Chairman

September 8, 1990

John W. Sampier, Jr., Mayor
City of Rogers
300 W. Poplar
Rogers, Arkansas 72756
(501) 621-1117

An Overview of the City of Rogers, Arkansas

The City of Rogers is the 12th largest city in Arkansas with a population of some 25,000. Rogers has experienced a 39% increase in population growth since 1980..........the largest increase of any city in Northwest Arkansas. This phenomenal growth is due to the quality of life, plus the beauty of the area coupled with a diverse economy. Our economy is based on industries, tourism, retirees (over 17% of our population), and agriculture. Industrial expansions, or new industries have invested over $332 million dollars over the last three years with an increase of over 2,400 new jobs. The unemployment rate ranges between 3.00 and 3.8%.

Infrastructure Needs

Unlike many cities in Arkansas, our infrastructure problems center around providing adequate services for one of the most rapidly growing areas of the nation.

Our most pressing need concerns an inadequate highway and road system to keep pace with our growth. One intersection in Rogers has the highest traffic count in Arkansas outside the metropolitan Little Rock area.

Our highest priority need is direct access to four-lane, interstate standard highways. We must have rapid inter regional, interstate and intra state movement of our commerce if we are to continue to flourish and be competitive.

Most importantly, the safety of the motoring public is at stake. The sobering injury and death statistics on Hwy. 71 and Hwy. 412 are a disgrace.

The completion of U.S. Highway 71 to interstate standards from Alma, Arkansas to the Missouri line will give us badly needed access to our markets and our state capital in Little Rock. We are continually at a disadvantage in interacting with the seat of state government in our capital city because of the arduous and dangerous travel required on this antiquated two-lane highway through the Boston Mountains. This link with the envisioned Interstate 49 from Shreveport, Louisiana to Kansas City, Missouri is of national significance considering a north-south link from the Great Lakes to the Gulf of Mexico.

It is also imperative to realize our potential with Tulsa, Oklahoma and Northeast Oklahoma by the joining of the Cherokee Turnpike with a four-lane U.S. 412. The significance of this project is greatly increased when one realizes the inter-modal connection with the Port of Catoosa and Tulsa International Airport.

Only these two four-lane projects of national significance will address the current deplorable problems of motoring safety and highway congestion in Northwest Arkansas. Correspondingly, in meeting these critical human needs, adequate rural access will be achieved as well as finally providing decent commercial access to the rest of the state and nation.

Within the City of Rogers, we desperately need the continuation of the Urban Aid Highway and Urban Aid Street Program. Adequate funding must be provided to the Arkansas Highway and Transportation Department in order for the City of Rogers to seek their assistance in improving and expanding our inner city highways and Urban Aid Streets and bridges. Only through such a program can we hope to alleviate inner city congestion, improve motoring safety, and have adequate access to the Highway 71 four-lane mentioned above.

Due to the expansion of industry and residential development to the west, traffic on U.S. 62 and U.S. 71B comes to a virtual standstill during peak daytime hours. Specifically, U.S. 62 and U.S. 71B must be upgraded quickly to at least 4 lanes or our economy and quality of life will be irrevocably damaged.

Coupled with adequate streets and highways is adequate management of drainage. An engineering estimate in 1978 pointed out it would take $4.2 million dollars just to correct the drainage problems in Rogers at that time. We would respectfully request an increased national role in helping to meet these inner-city drainage and flooding problems, such as with the able assistance of the U.S. Army Corps of Engineers.

The '86 Amendments to the Safe Drinking Water Act, as well as the mandates of the Clean Water Act, are prudent national goals as outlined by Congress. However, we respectfully suggest an increased role of congressional oversight in the development of agency guidelines to meet these goals. Common sense and an understanding of our severely limited local resources to meet these mandates is badly needed.

Rogers is trying to utilize the Revolving Loan Program for Wastewater Improvements. We respectfully request that an increase in the Arkansas allotment for this program as well as a reduction in the mindless "red tape" required for the loans would speed up our ability to make wastewater infrastructure improvements as envisioned by Congress.

We simply do not have the local resources to meet ever-increasing federal mandates in so many areas and at the same time provide adequate roads, fire protection, police protection and other basic services, without help. The mandates proliferate without commensurate assistance to meet those mandates. We are proud of several local and regional partnerships that have allowed us to jointly meet some national mandates, but we must have a renewed partnership from the federal level if we are to survive.

Rogers is appreciative of the assistance of the Committee on Public Works and Transportation as well as the Federal Aviation Administration in the development of Carter Field as one of the finest and safest general aviation airports in the midwest. We are cognizant of the need and supportive of the request of many of our Northwest Arkansas citizens for a reliever airport. At the same time we urge the continued support and assistance of those local, general aviation airports so vital to our cities and towns.

The nation does not have a new generation of infrastructure technology ready for its people. At present, it does not even have the resources or commitment simply to maintain the existing infrastructure. But the economic future of our nation and our children depends upon today's public investment. We recognize and are grateful for these national hearings of the Committee on Public Works and Transportation to form a foundation whereby, together, we can rebuild our cities for our children and our future.

REMARKS FOR THE FIELD HEARING OF THE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION TO BE HELD IN SPRINGDALE, ARKANSAS ON SEPTEMBER 8, 1990.

PREPARED BY RICHARD STARR, P.E., ENGINEER-MANAGER FOR BEAVER WATER DISTRICT LOCATED IN BENTON AND WASHINGTON COUNTIES, ARKANSAS.

I. WATER SUPPLY

INTRODUCTION

MY NAME IS RICHARD STARR P.E.. I AM THE ENGINEER-MANAGER OF BEAVER WATER DISTRICT. BEAVER WATER DISTRICT IS A NON PROFIT REVENUE FUNDED REGIONAL WATER DISTRICT PROVIDING POTABLE MUNICIPAL AND INDUSTRIAL WATER TO OVER 125,000 PEOPLE AND THE LARGEST CONCENTRATION OF FOOD PROCESSING INDUSTRIES IN ARKANSAS. THE DISTRICT WAS FORMED IN 1959 AND PURCHASED ALL OF THE MUNICIPAL AND INDUSTRIAL WATER IN BEAVER RESERVOIR, A CORPS OF ENGINEERS MULTIPURPOSE RESERVOIR LOCATED ON THE UPPER PART OF THE WHITE RIVER. WORKING WITH THE CORPS OF ENGINEERS AS A PARTNER, WE HAVE DEVELOPED AN OUTSTANDING WATER RESOURCE INTO THE ONLY PERMANENT LONG TERM RAW WATER SUPPLY IN THIS AREA. THROUGH SOUND PLANNING AND COOPERATION WE HAVE A HIGH QUALITY RAW WATER SOURCE ADEQUATE UNTIL THE MIDDLE OF THE 21ST CENTURY.

THE DISTRICT STARTED WITH AN IDEA AND HAS GROWN TO THE SECOND LARGEST WATER SYSTEM IN THE STATE OF ARKANSAS. WE ARE A GROWING AREA AND WATER HAS BEEN ONE OF THE KEYS TO THAT GROWTH. OUR WATER USAGE PROJECTIONS INDICATE THAT IN 20 YEARS WE WILL BE SERVING TWICE THE CURRENT NUMBER OF WATER USERS.

THANKS TO THIS AREA'S FAR SIGHTED PLANNING WE HAVE THE NECESSARY WATER RESOURCE INFRASTRUCTURE IN PLACE. NOW WE NEED TO DO TWO THINGS TO MEET THE GROWING WATER NEEDS OF THIS FINE REGION. THE FIRST IS TO BUILD IN A TIMELY MANNER THE TREATMENT FACILITIES, TRANSMISSION LINES AND STORAGE TANKS TO MEET THE PEAK DEMAND OF OUR WATER USERS. THE SECOND IS TO PROTECT THE WATER QUALITY IN BEAVER RESERVOIR SO THAT IT REMAINS A HIGH QUALITY RAW WATER SOURCE. THIS SECOND TASK WILL BE DIFFICULT BECAUSE OF THE LACK OF HIGH PRIORITY FOR THE PROTECTION OF DRINKING WATER SOURCES AMONG THE VARIOUS COMPETING INTERESTS AND THE GOVERNMENTAL AGENCIES.

TO ACCOMPLISH OUR TASKS WE NEED YOUR HELP AND SUPPORT IN THE FOLLOWING AREAS:

1. WE NEED LONG RANGE POLICIES THAT RECOGNIZE THE IMPORTANCE OF HIGH QUALITY RAW WATER SOURCES AND STOP THE USE OF THESE SELECT WATERS AS CONDUITS FOR TREATED AND UNTREATED WASTE.

2. WE NEED TO ENCOURAGE AND FUND PROGRAMS THAT REDUCE OR PREVENT THE IMPACT OF THE NON-POINT SOURCES OF POLLUTION LOCATED IN THE WATERSHEDS OF THESE SELECT RAW WATER SOURCES.

3. WE NEED POLICIES AND FUNDING THAT ENCOURAGE THE REGIONALIZATION OF WATER SUPPLY SYSTEMS BOTH IN FACILITIES AND IN OPERATIONS.

4. WE NEED REVISIONS TO THE 1986 TAX LAWS TO REMOVE THE PROVISIONS WHICH CAUSE HARDSHIPS ON FUNDING EFFORTS FOR CAPITAL IMPROVEMENTS WITH TAX EXEMPT MUNICIPAL BONDS.

5. WE NEED POLICIES THAT ENCOURAGE CONSERVATION IN THE USE OF WATER.

ABOVE ALL, WE NEED TO REALIZE THAT WE HAVE LIMITED AVAILABLE RESOURCES TO REBUILD AND EXPAND OUR INFRASTRUCTURE. THEREFORE, IT BECOMES IMPERATIVE THAT ALL FEDERAL, STATE, AND LOCAL PARTIES COOPERATE TO INSURE THAT WE GET THE MOST POSITIVE RETURN FOR EACH UNIT OF RESOURCES COMMITTED.

CLOSING

AN ADEQUATE SUPPLY OF PURE DRINKING WATER FOR HOME AND INDUSTRY IS NECESSARY FOR THIS OR ANY OTHER AREA TO GROW AND PROSPER. IT IS ONE OF THE VERY BASIC FOUNDATION BLOCKS OF OUR INFRASTRUCTURE. WE NEED TO INVEST A PART OF THIS NATION'S RESOURCES IN MEETING THIS NEED. THE TASK WILL BE MUCH EASIER AND REQUIRE FEWER RESOURCES IF WE DEAL WITH THE NEED BEFORE IT BECOMES A CRISIS.

  E. Summary

Statement for the Field Hearing of the Committee on Public Works and Transportation to be held in Springdale, Arkansas on September 8, 1990.

Prepared by Richard Starr. P.E., Engineer-Manager for Beaver Water District located in Benton and Washington Counties, Arkansas.

I. WATER SUPPLY SYSTEMS OF NORTHWEST ARKANSAS

A. Introduction

My name is Richard Starr, P.E.. I am Engineer-Manager of Beaver Water District. Beaver Water District is a non profit revenue funded regional water district providing potable municipal and industrial water to over 125,000 people and the largest concentration of food processing industries in Arkansas. The district was formed in 1959 and purchased all of the municipal and industriel water in Beaver Reservoir, a Corps of Engineers multipurpose reservoir located on the upper part of the White River. Working with the Corps of Engineers as a partner, we have proceeded from securing funding to completion of the only permanent long term raw water supply in this area. Beaver Water District started serving customers with potable water in 1966 through a 10 million gallon day treatment plant and has grown through two expansions to a facility which will produce 50 million gallons per day. We currently have a 40 million gallon per day expansion under design. We are a growing area and water has been one of the keys to that growth.

B. Importance of Water

The Committee on Public Works and Transportation will deal with a broad range of public works projects, but an adequate supply of safe pure drinking water for home and industry is the most critical and fundamental of all of the public works areas. The health and welfare of our people depend on water. The economic well being of our industries depends on water. Our strong poultry industry that feeds this nation and a large part of the world could not exist without our water. Without water you have nothing.

C. Priority of Water Supply at the Federal Level

Even though an adequate supply of safe, pure drinking water is the most critical and fundamental need in the public works area, it has a very low priority among the Federal Government Agencies and in Congress. There appear to be two major reasons for this.

The first is the crisis mode of operation by the government which is reinforced by the media. Two graphic examples come to mind. The first example is the Clean Water Acts of the 1970's and the creation of the Environmental Protection Agency which were developed in the setting of rivers so polluted that they caught on fire. This was a real crisis with millions of dollars spent successfully improving water quality. The second example is the disposal of hazardous waste and the Love Canal Site in New York, which helped bring about the passage of the Hazardous Waste Acts of the 1980's. This too is a real problem and we have spent millions of tax dollars working toward solutions. The jury is still out as to how well we have done.

The second major reason is that at the turn of the century the water industry started providing treatment and disinfection to water supplies that needed treatment. This effort eliminated the major threat of water borne disease in the United States.

The water industry has done a good job and has avoided a crisis. We have managed to stay ahead of the population growth and changing life styles, which adversely impact many of our raw water sources, through planning and sound engineering. While our water systems are acceptable today, the picture is changing.

D. The Changing Picture

The United States is continuing to gain in population and to increase in its per capita consumption of water. This is placing ever increasing demands on a limited supply of high quality raw water. As a nation, we further reduce the availability of this water supply by random dumping of our treated municipal and industrial waste into our raw water supplies with little or no thought to the impact on our current and future drinking water supplies. We are assured by the regulatory agencies that the waste is well treated and there is no problem with recycling treated wastewater into drinking water. This concept is from an agency created in a moment of crisis to deal with water pollution, and whose thinking is still dominated by a wastewater bias. Yet, in the face of this assurance, we see the passage by Congress of the 1986 Safe Drinking Water Amendments, which totally change conventional thinking on water treatment. The setting of these new regulations indicate that all is not well with the concept of putting treated waste into your raw water. These new regulations are forcing the industry into more complicated treatment schemes and making existing water plants, which currently produce safe water, obsolete by setting new and more stringent requirements on water treatment. Non-point source pollutants from agriculture, clear cutting, and urban runoff are adding to the degradation of the raw water sources. If you add to the above the fact that many water treatment facilities truly need to up grade their treatment processes because of raw water degradation, many facilities need increased capacity, many facilities are reaching the end of their useful life, then you set the stage for a situation that will cause the water industry to be unable to meet the challenge with its own resources as it has in the past.

E. What are the Needs

- We need to identify the existing high quality raw water sources that are being used for water supplies and protect them. It is much simpler to not put pollutants into the water in the first place, than it is to remove them by treatment. We need a program of water resource management that recognizes the importance of drinking water supplies and acts to protect them.

- We need to encourage and fund the programs that reduce the impact of the non-point sources of pollution located in the watersheds of water supplies.
- We need policies which encourage the regionalization of water supply systems both in facilities and in operations. This will encourage the use of the best water sources and maximize the utilization of existing trained personnel.
- We need funding to assist in the regionalization of water systems to serve the areas of real need and provide for the growth in this area. We need to invest in our infrastructure for our benefit and our children's benefit.
- We need to rethink how we develop drinking water regulations to determine if we are truly protecting public health. We have used the Delaney Amendment and other tools to set maximum contaminant levels which may be unrealistic. This may cause us to expend our limited resources meeting regulations which have no positive benefit.
- We need to place a higher priority on the funding of Federal and State Agencies' drinking water programs so that they are not limited to enforcement activity.
- We need policies that encourage and fund, through the State Health Departments, training programs to upgrade the personnel in the water industry to prepare them to meet the new technical demands of the 1990's.
- We need revision of the 1986 Tax Laws which cause hardships on the funding of capital improvements with tax exempt bonds.
- We need policies that encourage conservation in the use of water.
- Above all, we need to realize that, at this point in our Nation's history, we have limited available resources to rebuild and improve the infrastructure. Therefore, it is imperative that all Federal, State and Local parties cooperate to insure that we get the most positive return for each unit of resources committed. We must do this to grow and remain competitive in a world economy.

F. Conclusion

An adequate supply of pure drinking water for home and industry is necessary for this or any other area to grow and prosper. It is one of the very basic foundation blocks of our infrastructure. We need to invest a part of this nation's resources in meeting this need. The task will be much easier and require fewer resources if we deal with the need before it becomes a crisis.

II. WASTEWATER SYSTEMS OF NORTHWEST ARKANSAS

A. The 1980's: A Decade Committed to Improving Water Quality

1. During the 1980's, cities in Northwest Arkansas were committed to protection of the region's delicate environment. This commitment is evident by the capital investment of approximately 100 million dollars in local and federal funds to construct and upgrade wastewater treatment facilities in the Cities of Rogers, Bentonville, Fayetteville, Springdale, and Siloam Springs.

2. These municipal facilities have been upgraded to secondary treatment standards and most have advanced biological processes to remove ammonia and phosphorus. dechlorination and reaeration facilities have been provided to protect aquatic life and downstream water supplies.

3. Sewer service has been extended to nearby towns, providing a regional approach allowing smaller communities to benefit from the economy of scale for treatment costs and assures that a higher degree of operator skills are available in treating their wastewaters.

4. Improved water quality in receiving streams and lakes has been attained by virtue of this commitment to operate advanced treatment facilities.

5. User fees have, in some instances, tripled during the 1980's to provide the necessary revenue for construction, operation, maintenance, and replacement of wastewater treatment facilities.

B. The 1990's: A Decade With a Challenging Future

1. The focus of water pollution control efforts to date has been on the construction and upgrading of wastewater treatment facilities. The issues that must be addressed in the years ahead have much more elusive solutions.

2. The wastewater issue, which is critical to continued growth and development in Northwest Arkansas, is a ruling by the 10th U.S. Circuit Court of Appeals blocking the City of Fayetteville from discharging part of its treated effluent into the Illinois River basin. The Environmental Protection Agency had previously approved a split-flow discharge permit for the City of Fayetteville allowing a portion of the effluent to be discharged into a tributary that flows into the Illinois River. The Court has taken the position that a downstream state (Oklahoma) can block the issuance of a discharge permit in an upstream state (Arkansas), even in circumstances where the discharge will not have a detectable impact on the downstream state's water quality. This decision could also affect the Cities of Springdale, Rogers, Siloam Springs, Lincoln, and Prairie Grove. Each municipality

has been issued an NPDES permit, based on Arkansas water quality standards, to discharge treated effluent into a tributary of the Illinois River. The Court's decision will not only curtail growth and development in Northwest Arkansas, but it could have serious adverse implications for the national clean water program. It is ironic that wastewater treatment plants constructed to comply with the Clean Water Act could be denied future discharge permits under that same Act.

Legislation is clearly needed to identify the EPA's authority to determine water quality standards in each state.

C. Continued growth and economic development in Northwest Arkansas will require more emphasis on sewer collection systems. This vital part of the infrastructure will require large sums of revenue for expansion, replacement, and rehabilitation.

1. Growth areas will require extension of new sewer mains and the construction of costly pump stations to transport sewage over the hilly terrain commonly found in the region.
2. Additional line capacity will be needed in existing interceptor sewers to transport flows to treatment plants.
3. Rehabilitation of older sewers is needed to mitigate infiltration and inflow of extraneous water during rainfall events, to improve customer service, and to extend the useful life and efficiency of existing facilities.
4. The transition from the Federal Construction Grants Program to the State Revolving Fund Program will require cities to find alternate sources of revenue to retire debt service on state loans secured for sewer collection systems.

D. The land application of liquid sludge on agricultural land has proven to be the most cost effective alternative for the disposal of sludge generated at treatment facilities in Northwest Arkansas. Although the EPA supports the beneficial reuse of sewage sludge, the agency's proposed regulations for sludge disposal are so extraordinarily limiting that they essentially destroy land application as a possible sludge management alternative. Local officials support any effort on the part of EPA to gather comments from scientific groups and industry practitioners for the purpose of revising proposed sludge regulations. If peer review can be included in the process, it is likely that regulations which promote beneficial use of sludge, while protecting the public health and the environment, can be promulgated in an expeditious manner.

1. Disposal methods employing monofills, landfills, and incineration are not economically feasible in Northwest Arkansas. Similar alternatives proposed for the disposal of solid waste have met stiff opposition from the public.
2. Low application rates of sludge are based on the nutrient require-

ments of pasture grasses in the area, principally nitrogen. Because of this, nitrate accumulation in plants and nitrate contamination of groundwater is not a hazard with this disposal method.

3. Faced with the need for new sludge facilities, cities have been forced to spend several million dollars for sludge projects that might very well be regulated into obsolescence.

E. In summary, we find as many of the same things affecting the wastewater side of the equation as we find affecting the drinking water side. Increasing populations, old systems that need repairs, limited resources, lack of coordination between agencies, competition for the same basket of resources, the need for regionalization, all of which point to the need for this nation to find the will and resources to rebuild and expand our infrastructure.

I would like to express my personal appreciation to the Committee on Public Works and Transportation for the opportunity to share our concerns about the infrastructure of Northwest Arkansas and our nation, as well as the future needs we see for water and wastewater systems nationwide.

Tyson

Tyson Foods, Inc. 2210 Oaklawn Drive • P.O. Box 2020 • Springdale, AR 72765-2020 • (501) 756-4000

September 4, 1990

Committee on Public Works and Transportation
U.S. House of Representatives

Chairman Anderson and Distinguished Members:

Thank you for giving of your time to hear the future needs of infrastructure problems in Northwest Arkansas.

In 1963, when our company became a public company, it employed approximately 500 persons and had assets of almost five million dollars. Our processing plant had the capacity to kill 6,000 birds per hour and we were killing almost 13 million chickens a year.

Today, we employ 44,000 people and we utilize assets in excess of two and one half billion dollars. We have approximately 10,000 contract growers and their families living on family farms depending on us for their livelihood, and we kill 650,000 birds an hour.

Any way you measure the growth of our business in the last 27 years, it has increased in size by several hundred times.

Our company is headquartered in Springdale, Arkansas, and while it operates in many states, a large portion of its product moves over the same two lane highways of U.S. Highway 71 and U.S. Highway 68, which are in more or less the same condition they were 26 years ago.

We now operate 600 long haul over-the-road tractors, which haul our product. This represents only one third of the trucking fleet moving our product, as the other two thirds of our product is moved by common carrier. In addition, our live haul trucks and feed trucks number in the hundreds. TDC in Rogers, one of our major distribution centers, receives a hundred truckloads of product a day and runs 24 hours a day. We use one billion two hundred fifty million tons of soy meal a year and much of it moves to our feed mills in trucks.

Our growth has been paralleled by many other poultry companies in Northwest Arkansas, Georges, Hudson's, Peterson's, and Simmons, all of whom have grown many, many times in size and who employee thousands and thousands of people and ship thousands and thousands of shipments over these same two lane highways.

Feeding you like family.™

I know of no other industry that has grown at that rate which does not have direct access to a four lane interstate highway.

More importantly than the choaking of our roads is the safety of the roads for our people, as the highways in and out of Northwest Arkansas are some of the more dangerous highways in the country in terms of accident rates and number of fatalities.

Direct access to four lane international highways in Northwest Arkansas would up the productivity of the many poultry firms located here, as well as their affiliated industries. It would increase our ability to be competitive in the world market. We export many hundreds of millions of pounds of product a year, which we believe have helped our national trade deficit. We are a net exporter. The areas in which we employee people have very low employment rates. We believe we are doing our share toward national priorities. From the heartland of America, a little help from the government in matching the infrastructure to our efforts would be most welcome, most appreciated, and I assure you that it would be highly utilized.

Sincerely,

Don Tyson
Chairman & Chief
Executive Officer

DT/sm

STATEMENT OF
HONORABLE FRED VORSANGER
VICE MAYOR OF FAYETTEVILLE

FAYETTEVILLE... A COMMUNITY PROFILE

The City of Fayetteville is one of the fastest growing cities in Arkansas. This business and education oriented community has been aggressive in dealing with its growth and in anticipating future growth. Traditionally, the city's needs have been recognized and goals have been developed to effectively meet them. This task, however, is becoming increasingly complex due to increasing demands and limited resources. Along with the many benefits enjoyed by a growing community comes the strain that is placed on its existing facilities and infrastructure. Federal assistance can help ease this strain in a number of areas including water management, waste disposal, aviation, and transportation.

During the past decade, the emergence of a host of federal regulatory programs aimed at environmental protection has shown a significant rise in the Northwest Arkansas Region as well as the State of Arkansas. Traditionally, when the Federal Government Policymakers have wished to encourage the City of Fayetteville to perform some particular activity i.e. sewer rehabilitation, they have relied upon the technique of subsidization. Since the early 1980's federal subsidization including grants for the city have shown a steady decrease, while regulations placed on the city have increased.

Attached is a copy of "Fayetteville...A Community Profile." After examining some of the information it contains, Fayetteville's unique need for federal assistance becomes apparent. As indicated in this publication, the city's growth trend is phenomenal. From 1980 to 1990, the population of Fayetteville increased by almost 20% while the state population increased by only around 3%. It is estimated that between 1990 and 2000, Fayetteville's population will increase by another 22%. This type of growth is typical of the entire Fayetteville-Springdale MSA. And because of the excessive growth in the region, demands for improved highways, larger airports, greater water capacity, and improved sewer systems are placed on cities. The cities in the area, however, will be unable to meet the demand, and that is why more federal assistance is needed for our region.

The University of Arkansas in Fayetteville is the primary campus of the University of Arkansas system, and has contributed to higher education in the area for over a hundred years. Its programs in teaching, research, and public service are constant stimulants to the educational and cultural advancement of the region. And it is for this reason that many new industries and families locate in the area. Enrollment at the University has grown from 5,862 in 1960 to current enrollment of 14,000, and is expected to continue to grow in the future.

Drake field, the City of Fayetteville Municipal Airport, serves as the region's principal airport, and the growth of the area is reflected in the average increase of airline boardings for the last five years at 25.4% - from 65,963 in 1985 to an estimated 150,000 in 1990.

A top priority for Fayetteville is water improvements. Between 1990 and 2000, the city's average daily water flow is expected to increase by 30%. Millions of dollars needs to be spent on replacement of deteriorated water lines, additional storage facilities, and main construction and replacement in high maintenance and growth areas. The Water Quality Act of 1964, and the Clean Water Restoration Act of 1966 increased federal grants to state and local governments to improve water quality. But, these grants have decreased over the past few years. Fayetteville and surrounding cities located in Northwest Arkansas are in a unique situation compared with other Arkansas cities. This region's water is supplied by lake water, and not underground water. So, the cost associated with maintaining water quality standards for this region remains to be one of the highest in the state.

Expenditures of funds are also planned for a sewer system rehabilitation program. This program is designed to identify and correct deteriorated sections of the system to reduce infiltration and maintenance expenses. The City's 1990-1994 Capital Improvements Program for sewer rehabilitation has a total of $7,836,060 funded through sales tax. Unfortunately, there is no funding for such programs after 1994. The early 1980's marked a period when matching funds of 90%-10% and 75%-25% were available for Sewer Rehabilitation Programs. By the mid 1980's, however, these funds were cut.

Like most cities, one of Fayetteville's most urgent and visible infrastructure concerns is with surface transportation. Functionally, Fayetteville is concerned with keeping over 200 miles of streets maintained every year and constructing new streets as the need arises. The frequency of maintenance needs to be increased due to a 10% increase in the local traffic volume.

On broader terms, however, Fayetteville is greatly effected by the condition and location of the many highways passing through or near it. Improvements to these highways could give a large boost to Fayetteville's tourism and economic situation.

Specifically, the widening of Highway 412 from Tontitown to Siloam Springs, combined with Oklahoma's new construction will provide an easy link from Tulsa to Fayetteville. Also, travel to and from the north and south would be made tremendously easier if Highway 71, which passes right through the city limits, were widened from Louisiana to Missouri.

For the section of Highway 71 which passes from Alma to Fayetteville, the average daily traffic count has increased by over 22% over the last 10 years from 8,820 in 1979 to 11,360 in 1989. These numbers, however, do not include the heavy volume of local traffic from Alma and Fayetteville which adds to the congestion of this highway at least near these two towns.

In conclusion, the City of Fayetteville has approached federal regulations with cooperation, dedication and enthusiasm. But, the continued rise of a host of federal regulatory programs aimed at environmental protection, along with a decrease in funding provided to the city will continue to put a strain for funding future programs. Therefore, many infrastructure improvements within our beautiful city will only be a dream. And, if our community is to continue on the road to economic success, improved highways, larger airports, increased water capacity and many other improvements will become increasingly essential. We do, though, need the federal government's help more now than ever.

Due to the time constraint placed on the city, this paper cannot express all of the concerns felt by officials in Fayetteville. And as a result, Fayetteville would like to have the opportunity in the near future to express the concerns of our citizens in more detail. The Citizens of Fayetteville do thank you for the opportunity you have given us, and hope to meet with each of you soon.

COMMUNITY OVERVIEW

COMMUNITY OVERVIEW

The City of Fayetteville, County Seat of Washington County, is located in the northwest corner of Arkansas, some thirty miles east of the Oklahoma border and fifty miles south of Missouri. Sitting near the tallest of the mountains in the Ozark Mountain Range, the City enjoys four distinct and beautiful seasons in a climate that for decades has drawn a wide variety of individuals seeking a special environment to live, work and raise their families.

Settled by some of the regions' earliest pioneers in 1828, and achieved town status in 1835. By 1841, Fayetteville was an incorporated city. While Fayetteville played host to both the Confederate and Union Troops, it survived both to become one of the states most important centers for commerce and learning.

Since 1960, Fayetteville has grown from 20,274 to a projected 50,000 persons. Its unemployment rate has fallen to the current level of 3.9% and the per capita income has grown an impressive 61% since 1980. The significant economic growth in the '80's has been fueled by the phenomenal growth of Wal-Mart, Tyson Foods, J.B. Hunt Transport, and other locally-based companies. This has made Fayetteville known as the business center for the region.

Fayetteville has been aggressive in dealing with its growth -- and in anticipating that growth which is to come. A goal of the City's Economic Development Program is to not only encourage and support new business, but also to direct the growth into areas compatible with existing industry and the City's economic base. In early 1988, the City Manager formed citizen advisory task forces to evaluate City programs and to identify goals and objectives for City resources for the next five years. These are but some of the examples of the genuine effort to ascertain the best course for Fayetteville.

Fayetteville is home to the principal campus of the University of Arkansas system, which has contributed to higher education in the area for over a hundred years. Its programs in teaching, research, and public service are constant stimulants to the educational and cultural advancement of the region. Many new industries locate in the area because of the University, and many industries employ the newly graduated students. The University also forms one of the strongest supports of the local economy, with students spending about $18 million per year in local businesses, in addition to the input of the University payroll.

Another contribution of the University has been the development of the Genesis Program to advise, incubate, and develop new products and businesses, principally in "high-tech" disciplines. Many of these remain in Fayetteville. In a unique joint venture, the City has joined with the University to build and operate an arts complex that will serve the people of the region and the University program alike. When completed in 1991, the Center will house three theatres for the performing arts, an art gallery, studios for dance and art, teaching spaces for multi-disciplinary arts and an outdoor pavilion.

Drake Field, the City of Fayetteville Municipal Airport, serves as the region's principal airport, and economic growth of the area is reflected in the average increase of airline boardings for the last five years at 14.8%. Also, the planned completion of a multi-laned highway, south to Interstate 40 and north to Interstate 70 at Kansas City, puts the city squarely in the fast lane for continued growth in the next decade and into the 21st Century. Other available transportation in the area includes rail freight service through Arkansas & Missouri Railroad, daily bus service through Jefferson Bus Lines, and a number of excellent motor freight carriers.

The City serves the entire region through an outstanding regional medical facility, a Veteran's Administration Hospital, and a private facility which provides for treatment of mental disorders and chemical dependencies. The Fayetteville Public School system includes eight elementary schools, two junior highs, and two high schools. There are also private and parochial schools, and facilities for developmentally disabled children.

Realizing that the area's natural beauty is an asset which encourages both growth and tourism, preservation of a clean environment is a factor in the City's operations and decision-making. The Parks Division tends not only to the City's numerous parks and ballfields, but also has in its care large recreational areas and lakes for sporting enthusiasts of all kinds and ages. A new tertiary wastewater treatment system went online in 1988 that will provide for the community's projected needs for the next 20 years, and 1990 goals include plans for an expansion of the recycling program for the City's solid waste disposal to include a recycling/waste reduction facility that is planned for completion in 1991. It is hopeful that this facility would reduce the City's waste stream by at least 70%.

In summary, the City of Fayetteville, Arkansas, is a collective association of nearly 50,000 people in a region with a population base of over 250,000 who believe that the quality of life is influenced by the quality of the community. Perhaps that is why we are chosen as one of America's best places to live[1].

Section II

GOALS OF THE CITY

GOALS OF THE CITY

The City of Fayetteville Mission Statement adopted by the City Board clearly gives direction in the development of long-term goals:

- To have a forward thinking, credible and responsive government
- To provide for our citizens a safe, healthy, attractive, stimulating community in which to live and work by delivering the highest quality municipal services while seeking maximum value for dollars expended
- To have organized and sound deliberations, to develop reasoned policies with ample opportunity for public awareness and involvement

With this statement guiding management, divisional goals are designed to provide direction for every aspect of municipal activity.

■ ECONOMIC DEVELOPMENT

One of the main areas of emphasis for the City during the past two years has been economic development. With the knowledge that economic development does not produce immediate results, much time has been spent in the definition of both short- and long-term goals and objectives. Fayetteville's economic development program has been directed to emphasize not only the attraction of existing industry to our area, but to investigate all avenues of development. These components are all directed toward improving the fiscal base of our City, which is essential to maintaining our quality of life at a reasonable cost to our citizens and insuring the long-term financial well-being of the City.

Effective marketing of the Fayetteville area is an integral part of economic development. Comprehensive advertising campaigns to entice industry to locate in Fayetteville and tourists to visit the area will be possible with the current financial commitment of $150,000 each year. Within the overall goal to develop a community marketing program that will secure interest from new industrial, commercial or retail ventures of all sizes, other objectives have been outlined, including the development of target industry classification listings, ongoing inventory of existing facilities, accumulation of relevant statistical and service data to be distributed, and the marketing of the University as a benefit of relocation of "high-tech" firms.

Another important function of the economic development program is the retention and development of existing commerce in the Fayetteville area. Some initial proposals incorporate plans for a comprehensive survey of Fayetteville industry and business, thereby enabling specific assistance based upon actual need.

The encouragement and assistance of entrepreneurial ventures is also perceived as a target for economic development. Recent evidence indicates that significant job growth is produced from the creation of new small businesses, and the City plans to capitalize on every area available.

We are confident that our goals will be realized in the area of economic development. Encouraging evidence of the marketability is the fact that Fayetteville climbed from # 68 to # 39 in Inc. magazine's annual ranking of the metropolitan economies, which uses business birthrate, percentage growth in private employment and the percentage of young companies experiencing high growth as the three historical criteria for the rankings[2].

■ SAFETY AND SERVICE

Areas of City operation such as police and fire protection are guided by the City's goal to provide for our citizens a safe, healthy, attractive, and stimulating community in which to live and work. Fayetteville is fortunate to have an FBI Crime Index rating of only 57 crimes per thousand of population per year. The Police Department goals and objectives include expanded efforts in training and crime prevention programs, an update of the Department's entire Policy and Procedures, and a step-up in drug enforcement efforts assisted by a special State grant.

The Police Department has planned and implemented the only comprehensive and continuous drug education program in the area. As a law enforcement agency this is considered part of general crime prevention responsibilities. The Fayetteville Police Department is committed to community drug education programs as an integral part of crime prevention operations. The following projects are the only such programs offered in Fayetteville.

---

[2] Inc., March, 1988

Drug Prevention Programs

The Fayetteville Police Department is the only law enforcement agency in Northwest Arkansas with the Operation DARE project. Operation DARE, Drug Abuse Resistance Education, is nationally recognized as the most effective youth drug prevention program in the United States. It has resulted in a marked decrease in the number of youths who use drugs, teen suicides linked to drugs, truancy rates, and overall juvenile delinquency attributed to drug abuse.

In 1989 approximately 618 5th. grade students participated in Project DARE. Over 135 work hours in DARE presentations have been recorded for the entire 5th. grade elementary school population of Fayetteville. Project DARE plans for 1990 include an additional target group which will double the number of hours for the program.

Speaking Engagements

Over the last three (3) years the Fayetteville Police Department has integrated crime prevention and drug abuse prevention as part of core operations. As a result of this commitment, the police department has developed a reputation for fighting the drug war on the street and in supporting anti-drug abuse programs in the schools and family.

Citizens of Fayetteville and Springdale have made special requests for lecture presentations in their community, work place and schools. The majority of request for speaking engagements concern drug abuse and prevention. The Police Department averages approximately 20 - 25 special lecture presentations per year on this topic alone.

Speaking engagements on drug abuse prevention are generally provided by the police department. Periodically, private industry will market services as part of a drug abuse prevention lecture presentation. Unlike police department presentations, private industry speaking engagements concentrate on what clinical assistance is available after the fact. Therefore, with the help of both the private and public sectors, all aspects of drug abuse and prevention education is available for our citizens.

The Fire Department for the City of Fayetteville provides fire protection for the City and outside the City properties that have fire contracts. These services include responding to and extinguishing unfriendly fires, performing rescue operations, fire prevention and fire hydrant maintenance. One of many objectives for the Fire Department is to continue to educate the citizens of our community of fire prevention techniques that can be used which contribute to saving lives, such as the proper use and placement of fire alarms, escape plans - enabling persons to safely escape unfriendly fire situations. A number of seminars and presentations are provided to the public -- at schools in particular. The fire department will contact at least 80% of kindegarden school children on the dangers of fires, as well as provide tours of the fire facilities. Other objectives for the fire department for 1990 include structured training to all Firefighters, including new recruits, in all phases of firefighting, prevention and general fire department operations. The training is provided by the Arkansas Fire Academy for certification of training which ensures that the department will maintain a high proficiency with new firefighter standards. Other objectives include maintaining an average response time of four minutes or less for the first-in company on emergency responses within the City, as well as stopping 50% of all working structural fires short of a total loss, and to control 95% of all structural fires in 3/4 hour or less. With the success of the bond election, the fire department will have one of the most modern fire department's in the State of Arkansas, which will ensure the community that their need for fire services will continue to be excellent today and the future.

▪ PUBLIC WORKS

As in all areas of the City, the Public Works Department is committed to providing the best services for the fewest taxpayer dollars. In this regard, the City has undertaken the City's first attempt at a formal application of a performance management system. The computerized Maintenance Management/Work Order system is on-line, and through the careful analysis of feature inventory, work methods, and required resources, Fayetteville hopes to maximize the resources available in this area of operations. Another area of concern to Public Works is the refurbishment of the City's infrastructure, which is being addressed by the City's Five-Year Capital Improvements Program and will be discussed in more detail in the section which outlines the Program.

The City has made a major commitment to waste water pollution control. The completion of the new tertiary Waste Water Treatment Plant was but the beginning of the City's design to aggressively manage this problem. In order to meet environmental regulations, an aggressive approach is necessary, and a responsibility to state and federal government authorities as well as the citizens of Fayetteville has initiated a multi-million dollar sewer rehabilitation program.

■ FINANCIAL MANAGEMENT

Financial management is a strong area of emphasis for Fayetteville's city management team. The City's goal is to ensure that a position of solid fiscal soundness is maintained through tight financial and budgetary controls, and by assuring careful and aggressive investment activity. To that end, the City has instituted an internal auditing program and has reorganized many functions in accounting, purchasing, data processing, and budgeting, into a Finance Division, which will provide a more streamlined service. Financial planning is strongly emphasized, with a performance/program budgeting format, and a 5-Year Capital Improvements Program being updated annually. Further, management continues to endorse the philosophy that for the City to remain fiscally healthy, an unrestricted fund balance resource equivalent to at least 10% of the general operating fund should be maintained.

The commitment that management has made to fiscal integrity and control has recently paid off for the City. The City was awarded the Government Finance Officers Association's "Certificate of Achievement for Excellence in Financial

Reporting" for its 1988 Comprehensive Annual Financial Report. In addition, the City was awarded GFOA's "Distinguished Budget Presentation Award" for its 1989 Annual Budget. These awards are the highest forms of recognition in governmental accounting and budgeting, it is felt that their attainment represents a significant accomplishment by City Management and the Board.

While the goals of the City are ambitious, they are by no means unattainable. The City's goals are realistic and backed by a professional management team, a dedicated staff, and an enlightened and responsive City Board. The City stands ready to advance into the 21st century, capitalizing on the experiences of the past, the academic preparation of our staff, and the valuable knowledge and civic concern of our citizens. With the cooperation of all elements of our community, we are certain to be in the forefront of progressive municipal theory and practice.

Section III

MANAGEMENT - REORGANIZATIONS & PHILOSOPHIES

MANAGEMENT - REORGANIZATIONS & PHILOSOPHIES

The City of Fayetteville operates under the manager-director form of government, which provides for a seven-member Board of Directors, with the mayor elected by the Board from among its members. The Board appoints a professional city manager. Directors are elected on a non-partisan basis. Four of the seven directors run from single-member wards within the city and three directors run at large. All directors are voted on by all city voters and serve four-year terms. At-large directors are elected at a presidential election. The four ward directors are elected at the following general election.

In the two decades that the city has utilized the manager-director form of government, several sweeping changes have occurred. The most significant changes have occurred in the last 5 years, with a major Performance Audit being conducted in 1986, along with a comprehensive reorganization. The reorganization, which was aimed at improving efficiency and managerial effectiveness, was the outgrowth of Board action that was begun in 1984.

Arthur Young & Company, the firm selected to conduct the performance audit, began a six-month review of City policies and organization in 1985. The overall goal of the study was to develop recommendations that would enable the City to improve its managerial effectiveness and productivity. A total of 205 employees, including supervisory and non-supervisory, were surveyed, with over 45 employees and directors being interviewed for their suggestions, opinions, insights and problems. As a result of the performance audit, a major staffing reorganization was recommended and undertaken.

Since the performance audit in 1986, substantial changes have occurred in the City. City services have expanded, departments have reorganized, program emphasis has changed, and positions have been restructured without corresponding changes in the formal classification and compensation systems. Consequently, in 1989, the City hired Hay Management Consultants to assist the city in performing a comprehensive review and study of the city's job descriptions, position classification program, pay plan, and benefits plans, which cover approximately 120 positions and 350 employees. The comprehensive review and study was required to promote and assure internal equity in pay and maintain competitiveness in the external pay markets in which the City competes for qualified personnel.

In 1990 a new City Manager was hired and further reorganizational steps were taken to better streamline and solidify the top staff of the City, as well as enhance the responsiveness of City staff, and to complete the performance audit report's recommendations. From these reorganizations, a basic but underlying management philosophy has emerged. That philosophy consists of the following elements:

- An emphasis on economy and efficiency in all operations
- An emphasis on a strong financial management and control system for the protection of the city's assets
- An emphasis on a comprehensive economic development program to broaden and strengthen the city's tax base; with the addition of this program we have added an Economic Development Coordinator
- An emphasis on policies and procedures that are geared toward responsiveness.

A number of accomplishments can be recognized from these reorganizational efforts:

- **CENTRALIZED UPPER MANAGEMENT**

  Prior to the 1986 reorganization, approximately 15 department heads reported to the City Manager. Under the present organization, five departmental directors exist: Police, Fire, Planning Management, Public Works, and Administrative Services. This has resulted in better direction being given to divisions and a consolidation of the management team.

■ CHANGES IN KEY PERSONNEL

Changes in key personnel resulted from the City's reorganization efforts. New individuals have been hired in all of the City's departmental director positions. With many of the Department Directors being promoted from within the City. This has provided the city with many years of needed experience. And has resulted in a management style that is conducive to the goals of efficiency and economy.

■ STREAMLINING OF BOARD/STAFF RELATIONS

Relations between the City Board of Directors and staff have also changed dramatically as a result of the reorganizations. The Board formerly had a number of committees which dealt with different parts of the organization. These included an Airport Committee, Finance Committee, Public Works Committee, and Personnel Committee, among others. These committees often dealt with division heads and other lower-level staff and were very much involved in the day-to-day activities of City management. Currently, all Board contacts are directed through the City Manager or the departmental directors. This has resulted in less Board involvement in day to day management and more involvement in policy-making.

■ IMPROVED CHANNELS OF COMMUNICATIONS/COMPLAINTS THROUGH STANDARDIZATION OF PROCEDURES FOR CITIZEN REQUESTS

One improvement that directly affected the public as a result of the reorganizations was the establishment of improved channels of communications/complaints through standardization of procedures for citizen requests. The Board of Directors and staff have made a priority of maintaining a high level of responsibility and responsiveness to citizen needs. A citizen assistance function was set up in the City Manager's office to coordinate and document the citizen problems, needs and complaints. This function will be expanded in the 1991 calendar year to include comprehensive computerization of citizen problems, needs and complaints. Also, to continue to improve communication channels between the Citizens of Fayetteville and City Government, City Board meetings are televised locally, and full disclosure of city activities is a high priority. One of the top priorities for management in the 90's is to continue to improve and expand communications between the Citizens and Government in order to be truly consistent with this nation's principles of democracy.

- **EMPHASIS ON CURTAILING INFRASTRUCTURE DETERIORATION**

  Like many cities of Fayetteville's size and age, parts of the city's infrastructure have reached the end of their life cycle. Water and sewer lines, streets, drainage structures, and other related facilities are planned for replacement through the five year capital improvements program. During the recent primary election, the citizens of Fayetteville overwhelmingly approved $33,000,000 of bonds to help fund the capital improvement program, to solve the City's infrastructure needs. Improved management of the infrastructure through regular inspections and scheduled preventative maintenance will lengthen much of the infrastructures usable life. The capital improvements program, coupled with improved preventative and corrective maintenance, is designed to provide a comprehensive, planned solution, to the deteriorating infrastructure problem, in the future.

- **PERFORMANCE MANAGEMENT SYSTEM**

  A performance management system was designed and placed into operation in the Public Works Department. A consultant was brought in to set up and implement a maintenance management system in the Department that tracks and records work performed. This information is compared to a series of "performance standards" to determine areas of improvement, and to assist the department in making management decisions for the budget in terms of staffing and equipment needs, resource allocations, and etc. This system was set up in order to increase the efficiency and effectiveness of the

City's maintenance functions.

- **INCREASED EMPHASIS ON PLANNING**

  Areas of City operation such as planning, inspection, code enforcement, and parks and recreation are guided by the City's goal to provide for our citizens a safe, healthy, attractive, and stimulating community in which to live and work. In 1988, the City hired its first professional planner in the person of the Planning Management Director. Currently, a new planning ordinance is being developed by a consultant which should provide for better and more controlled growth. Also, a Planning Consulting Firm was selected to update the City's General Land Use Plan, and develop a new planning ordinance. The General Land Use Plan, as well as new zoning ordinances are being developed after close analysis of areas such as physiography, community history and facilities, and population and economic trends. Although the primary objective is to determine future land use, recommendations are evolving for the areas of transportation and infrastructure systems. 1990 plans include the completion of a totally new planning ordinance and development process. These steps have been taken in an attempt to realize the City's goal to organize a vital department which directs growth and protects the integrity of our community.

- **INCREASED EMPHASIS ON FINANCIAL PLANNING**

  An overall increased emphasis on planning has been seen as a result of reorganization. Each budgetary program is required to be defined by quantifiable goals, objectives, and strategies. The City's budget has been developed into an effective planning document with a move toward program budgeting. Finally, the Five Year Capital Improvements Program was established in order to more effectively plan for future needs.

- **INCREASED EMPHASIS ON SAFETY**

  The City has focused on an increased emphasis on safety, both for the public and employees. Monthly employee safety meetings have been enacted, CPR classes have been offered to City employees and certification in CPR has been made mandatory, and Defensive Driving classes have been required for all operators of City vehicles.

- **IMPROVED INTERNAL AUDITING AND CONTROL PROCEDURES**

  The City's internal auditing and control procedures have been dramatically improved as a result of reorganization. The City has hired its first Internal Auditor in 1988, which has worked at establishing better practices of internal control. The position is responsible for city-wide internal control administration, grants accounting, all federal compliance and funding, and is in charge of coordination of the annual financial audit.

- **CENTRALIZATION OF ACCOUNTING FUNCTIONS**

  A final result of reorganization has been the centralization of all accounting functions under one area. Formerly, a number of areas acted independently (Airport, Wastewater Treatment Plant Project, and Community Development) of the Finance Division. With an addition of a number of positions in 1988, including the internal auditing position, all divisions, operations and projects are accounted for in the Finance Division. The Finance Director, under the direction of the Administrative Services Director, coordinates the activities of accounting, auditing, purchasing, water and sewer services, and data processing.

- **REGIONAL COOPERATION**

  A regional approach to the continued economic success of Northwest Arkansas is important to this region as well as the State of Arkansas. A regional concept also plays a very important role in safety and service for the citizens of Fayetteville and surrounding areas. Such as drug enforcement and hazardous materials to mention a few.

The Northwest Arkansas Regional Hazardous Materials Response Team (NWARHMRT) was formed to comply with the Superfund Amendments and Reauthorization Act of 1986. The regional concept is the most cost effective way to provide complete response coverage to Benton and Washington counties.

NWARHMRT is made up of 30 members from the following paid fire departments in Benton and Washington counties: Bella Vista, Bentonville, Fayetteville, Rogers, Siloam Springs, and Springdale. The regional ream is set up to collectively handle any major hazardous material incident in the two county area. Each department has an in house team to handle less serious routine hazardous materials incidents.

Fayetteville Fire Department has five members on the regional team. These five members also comprise our in-house team and handle the less serious incidents within the city. The following personnel make up Fayetteville's Response Team: Captain Gregg Riley (Team Coordinator), Captain Rick McCurdy (Regional Training Coordinator), Firefighters Gerald Thompson, Paul Knapp, and Kyle Linn.

The NWARHMRT is managed by the Northwest Arkansas Metropolitan Fire Chief's Association, Incorporated. This organization is made up of all the paid fire chiefs in Benton and Washington county. Metro Chiefs manages the operations, budget, and policies of the regional response team. The Metro Chiefs also handle the incident command function for any regional response in their designated response areas.

- **INCREASED EMPHASIS ON ECONOMIC DEVELOPMENT**

  An increased emphasis on economic development has also been the result of reorganization. The City now employs a full-time Economic

Development Coordinator who works to attract industry and business to the City and to maintain the level of economic activity that currently exists.

- **EMPHASIS ON STRATEGIC MANAGEMENT**

  Strategic management is a process that includes conceptualizing a mission and setting goals, analyzing key factors in the internal and especially the external environment (e.g., opportunities, threats, strengths and weaknesses), developing strategies, and developing and implementing action plans. These actions are sometimes known as developing a mission statement, situation analysis, strategic planning or action planning. City management has taken major strides towards implementing the key concepts of a strategic management philosophy.

Section IV

FIVE YEAR CAPITAL IMPROVEMENTS PROGRAM

FIVE YEAR CAPITAL IMPROVEMENTS PROGRAM

The Five Year Capital Improvements Program, 1990 - 1994 that totals $80,724,861, was developed and implemented as a comprehensive plan for Fayetteville's long range capital improvement needs and for responsible financial planning for those needs. The annual review of the program will be made to evaluate the demands for capital improvements and the City's ability to pay for those improvements from current revenue and borrowings. As evidence of public support and approval of the CIP, the voters adopted a 1% local sales and use tax within the City for a period of 20 years to finance capital improvements to be made over the next five years. This tax revenue will benefit the City's ongoing effort to provide the best municipal services possible to the citizens of Fayetteville. As evidence by the recent bond election, the Citizens overwhelmingly approved a $33,000,000 bond issue, which will allow the City to address many of its infrastructure needs. The City will also issue Water and Sewer Revenue Bonds in the near future.

- **PUBLIC WORKS**

  A top priority for Fayetteville is Water and Sewer system improvements. The City's water is purchased from the Beaver Water District and is presently transmitted through a single 36" line for a distance of 72,000 feet. Construction of a parallel line is scheduled to begin this year at a total cost of $12 million. Another $3,660,000 is proposed for other improvements to the water system to include replacement of deteriorated water lines, additional storage facilities, and main construction and replacement in high maintenance and growth areas.

  Examination of the sewer system with new television inspection equipment as well as the implementation of permanent flow monitoring stations are important elements of the City's sewer system rehabilitation program. This program is designed to identify and correct deteriorated sections of the system to reduce infiltration and maintenance expense. The capital improvements program outlines $ 9,875,000 in sewer rehabilitation projects.

The Street Division is another area of Public Works which plays a significant role in the five year plan. Travel within the City depends upon conveniently placed and properly maintained streets, and over $10 million has been included for street construction, reconstruction and improvement throughout the City. Drainage and bridge improvements are projected to be an additional $3.9 million.

Traffic direction and control is another area of municipal service which is being guided by the directional growth of the City and the 9.28% increase in traffic volumes in the last 5 years. New traffic signals at a cost of $174,050 are planned along with $120,000 for parking meter replacement in 1990.

Similar to other areas of the nation, Fayetteville has been faced with difficult decisions concerning the disposal of solid waste. A decision by the voters to disengage from the Northwest Arkansas Resource Recovery Authority has been approached as a directive as to finding the solution to this problem. Primarily because of public opinion, the City initiated a recycling/waste reduction program which has currently reduced the waste stream by 15%. And because of the success of the bond issue, the City can expand and improve the program to include a two (2) phase recycling/waste reduction facility. Phase I of the facility will begin within the next few weeks at a total cost of $750,000. Phase II, at a cost of $250,000, will begin in mid 1991 and is scheduled for completion by the fourth quarter of 1991. This facility will be built with an ability to expand and serve as a regional facility -- as the population continues to grow and waste increases accordingly, the facility will have the ability to expand to meet the need, whereby, reducing waste to area landfills.

Airport improvements, library expansion and parks development are also proposed as necessary projects to the long-term goals of the City. As population projections indicate a need for at least a 46% increase in library floor space, $500,000 has been designated in the recommended 1989 projects of the Five-Year Program. In Parks and Recreation, Youth Center Swimming Pool renovations and the purchase and development of a park in the northeastern growth area of the City are major projects planned to begin soon. $503,545 has been allocated to Parks improvements over the next five years, and approximately $1,000,000 has been allocated for the renovation of the Youth Center Pool.

- **ECONOMIC DEVELOPMENT**
  In the development of Fayetteville's long-range plan, economic development again has been considered a priority. The 1990 budget and work program, as well as our long-term goal, calls for industrial and commercial recruitment and development, maintaining and assisting existing business and industry, promoting the Industrial Park while also looking to the Highway 71 corridor, and assisting in tourism. Included in the CIP is an investment of $3 million for the Industrial Park, primarily for the acquisition of land.

- **ADMINISTRATIVE SERVICES**
  Under the current organization of the City, all vehicles and equipment except Fire Department vehicles are placed in the motor pool and are purchased, maintained, and replaced by the Shop Division. Replacement of equipment is therefore presented in the Shop section of the capital improvements program. The total planned investment in vehicles and equipment is $4,692,608 for 1990 - 1994.

The City has joined with the Fayetteville Humane Society in an effort to build a new animal shelter. During the first quarter of 1990 the ground breaking for the animal shelter took place. The City has pledged $150,000 in the Animal Control Division toward the construction of the animal shelter, and the Humane Society has contributed an equal amount to the project.

Advanced technology is being applied in the Meter Division through the use of a computerized Meter Touch Read System. This system is scheduled to be completed by 1999 with $337,500 allocated in the next five years for conversion and installation of the new meters.

- **FIRE DEPARTMENT**

  The need to relocate an existing fire station at a cost of $325,000 has been determined based upon the growth pattern of the City as well as the ineffectiveness of the present location. Also, a planned replacement of four (4) older fire trucks is included in the five (5) year capital improvement program at an estimated cost of $1,055,000.

- **POLICE DEPARTMENT**

  The success of the bond election will enable the police department to remodel the police facility, enabling much needed space for Central Dispatch. The Police Department's equipment needs will be provided through the Motor Pool, with at least $100,000 provided each year for Patrol Car replacements, as well as other capital needs

Section V

SELECTED GOVERNMENTAL INFORMATION

SELECTED GOVERNMENTAL INFORMATION

■ THE BUDGET PROCESS

The Fayetteville annual budget is a fiscal plan which presents the services which will be provided to the community and the funds needed to perform these services. The City's budget is presented on a GAAP basis which allows for fair presentation of the financial position for the City of Fayetteville. The type of service and the level of service is defined by program objectives, which are further defined by performance measures. The 1990 budget includes line item expenditures. This will be the last year for compilation of a hybrid budget, which includes line item expenditures. At the direction of the City Board, staff will attempt to prepare a strict program/performance based budget in 1991. The City Manager is responsible for formulating the fiscal plan and presenting it to the Board of Directors for approval and adoption.

The City's Fiscal Year currently runs from January 1 to December 31. The budget process begins in the preceding May, with a budget preparation package being distributed to all Department Directors and Division Heads. It includes a detailed manual with the budget preparation calendar, examples of all forms and instructions for completing these forms to request funding for 1991. All capital items requested are then reviewed by the Department Directors and Budget Staff to determine whether original cost and continuing cost are within the available funding range. All capital items with an original cost that exceeds $5,000 must have appeared in the 5 Year Capital Improvements Program.

A special board meeting is held in December at which the Board of Directors review, ask questions, and make needed revisions to the proposed budget document. The budget is adopted at the second regular meeting in December. The 1990 budget consists of $72,891,093 in revenues and $72,891,093 in expenditures. Pages I through XXIX in the 1990 Annual Budget and Work Program document for the City of Fayetteville provides an excellent summary of the budget.

■ PERSONNEL

The City is organized into six (6) major departments: General Administration, Administrative Services, Public Works, Planning Management, Police and Fire. (See page 24 for a diagram of the City's organizational chart). The General Administration Department is composed of the City Manager, Municipal Judge, City Attorney, City Prosecutor, Economic Development, and Communications Divisions, and includes 24.5 positions. The Administrative Services Department is composed of the Finance, Internal Audit, Building Maintenance, City Shop, Animal Services, Personnel, Water and Sewer Services, City Clerk, and Municipal Court, and includes 73.75 positions. The Police Department includes 67.5 positions and the Fire Department includes 54 positions. The Planning Management Department is composed of Engineering, Inspection, Planning, and Community Development and includes 18.5 positions. Finally, the Public Works Department is composed of the Public Works Management, Water Division, Sewer Division, Solid Waste Management, Pollution Control, Airport, Street, Traffic, and Parks and includes 117.75 positions. There are 356 positions budgeted in the 1990 budget at a total salary and benefit cost to the city of $10,555,010.

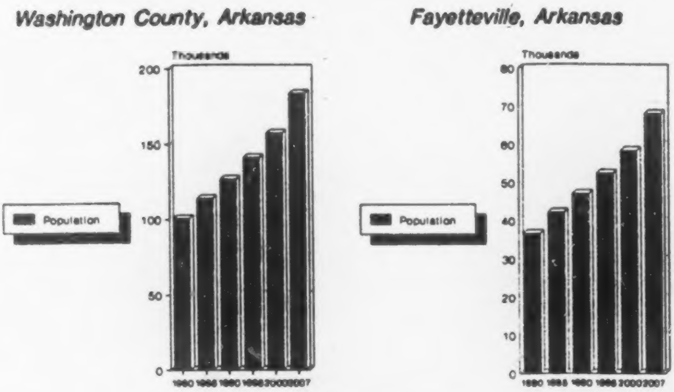
Appendix B

GENERAL FAYETTEVILLE DATA

POPULATION PROJECTIONS

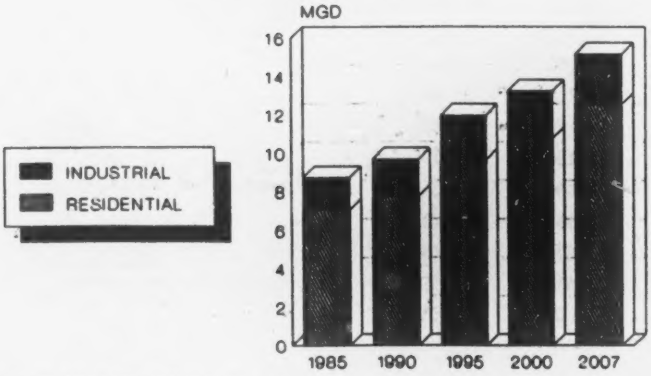


Source: Beaver Water District -
MASTER PLANNING STUDY (1987)

As a starting point for predicting the future populations of Fayetteville and Washington County, the historical growth that occurred between 1960 and 1980 was utilized to develop a population window. The absolute, or arithmetic, growth rates were used to predict the low side of the window and the percent growth rates were used to predict the high side, based upon a geometric projection.

To narrow these windows, interviews were held with key individuals in the public and private sectors. Based on the information collected during these interviews, the population projections for Fayetteville and Washington County were developed.

City of Fayetteville
Water Use Projections
Average Daily Flow



Source: Beaver Water District -
MASTER PLANNING STUDY (19[illegible]7)

Water for the Fayetteville area is supplied by the Beaver Water District, which negotiates with the U.S. Army Corps of Engineers for the purchase of up to 120 million gallons per day of water from the 1,600,000 acre-foot reservoir. In an effort to anticipate future needs to expand or improve existing facilities, water demands were projected into the 21st century.

The projection of future water demands for Beaver Water District is based on historical per-capita water consumption and industrial water use. Based on this criteria, average day demands are projected for the years 1990, 1995, 2000, and 2007.

Committee on Public Works and Transportation
U.S. House of Representatives

Chairman Anderson and Distinguished Members:

Thank you for the opportunity to make comments about Northwest Arkansas and the pressing need to develop an improved highway and aviation system of infrastructure which will support and sustain the future growth of Northwest Arkansas.

Northwest Arkansas, the Third Congressional District of Arkansas, a multi-billion dollar economic hub of production and distribution at the population center trendline of the United States, has experienced profound population and economic growth over the past 30 years. Northwest Arkansas is one of the largest centers of population in America which does not have a four-lane link to the Interstate System or an adequate airport facility to meet the region's needs. In spite of those infrastructure deficiencies, two counties of the region, Benton and Washington, have seen their population grow 129 per cent since 1960.

According to the preliminary 1990 census figures, these two counties of Northwest Arkansas had a population growth over the past ten years which accounted for almost 64 per cent of Arkansas' total population increase during the period from 1980 to 1990, a rate of growth which is more than 8 times the state average.

The economic well-being of Northwest Arkansas mirrors the growth in population as evidenced by almost a 16 times increase in property tax assessments during the last 25 years and almost a 2,000 per cent increase in bank deposits during the same period.

Looking forward, the future looks equally bright, as some early projections call for the two-county area to almost double again over the next two decades as the region continues its economic growth.

However, without an improved highway system and an adequate airport, the future growth and economic prosperity of Northwest Arkansas could well be jeopardized. We need to build a Mid-America Reliever Airport, much like Alliance Airport near Dallas, in Northwest Arkansas. Such a facility would not only provide us with a safe, dependable link to the Nation's aviation system, but it would be an economical method of helping solve the overcrowding and congestion of air space, airports and ground access facilities at the major Mid-American hub airports.

One McIlroy Plaza • Suite 302 • Fayetteville, Arkansas 72701 • (501) 444-4000 • FAX # 444-4018

September 6, 1990
Page 2

We also desperately need direct four-lane access to the Interstate Highway System, both along U.S. 412 to Interstate 44 at Tulsa and U. S. 71 to I-40 on the south and Interstate 44 on the north.

We believe that the needs of Northwest Arkansas for an improved transportation system is of national scope and meets the funding and programmatic criteria for development. We would appreciate your favorable consideration of our request.

Sincerely,

Alice L Walton

Committee on Public Works and Transportation
U.S. House of Representatives

The Honorable Glenn M. Anderson, Chairman

As you know, our area of the state here in Northwest Arkansas is on the brink of emerging into the center of business and commerce for the entire Southwest. Recent census figures have proven the growth in population. Increase in traffic, not only from those who visit our area but those travelling through to other destinations, has put a strain on our highway network. Air traffic has increased to the point of questionable safety. These matters need to be addressed and resolved as quickly as possible.

When our Company was formed 30 years ago in this small community of Bentonville, we certainly did not envision the growth we have experienced. We currently have approximately 7,500 associates residing in Benton and Washington counties and expect that number to swell as we expand our store operations to meet the needs of the population movement. Our Wal-Mart trucks travelling daily in and out of the Bentonville area number approximately 175 and we rely, as well, on a number of outside sources for shipment of our goods. We also have a number of vehicles delivering processed film and servicing our various facilities.

The vendors who supply our retail stores with their merchandise routinely fly into our area to conduct business. They represent some 25 billion dollars worth of goods that are supplied through our distribution system. They use our airports and other means of getting in and out of the Bentonville area. Many of our management folks also require the use of commercial conveyance and this will continue to grow.

Our Oklahoma neighbors, Governor Belmon, and business friends who have reason to use the Tulsa transportation facilities have seen the need for an improved highway system into our area and are already responding . We feel compelled to join them in their efforts to make our program more successful.

Industries have been planned for Northwest Arkansas which will ultimately require additional services. With the changes we can expect, we must be prepared. We owe the best we can provide to the citizens of Arkansas.

Very truly yours,

Sam M Walton

Before the
Committee on Public Works and Transportation
Future of Our Nation's Infrastructure Needs:
Northwest Arkansas
Springdale Holiday Inn
Springdale, Arkansas
September 8, 1990

J. Randy Young, P.E. is Executive Director and Secretary of the Arkansas Soil and Water Conservation Commission ("Commission"). This agency establishes policy and makes funding and regulatory decisions relative to soil conservation, non-point source pollution, water rights, dam safety, water resources planning and development, and floodplain management.

Mr. Young serves as a member of the Arkansas Pollution Control and Ecology Commission that oversees the Arkansas Department of Pollution Control & Ecology ("ADPCE"), the state's air, water, hazardous waste, solid waste, and mine reclamation agency. Mr. Young also serves as a member of the Arkansas-Oklahoma Arkansas River Compact Commission and the Red River Compact Commission. These commissions deal with water rights and water quality on interstate streams between Arkansas and neighboring states. Mr. Young is also Chairman of the Arkansas Water Well Construction Commission and a member of the Advisory Committee to the Arkansas Scenic River Commission.

I welcome this opportunity to present testimony concerning the future infrastructure needs of Arkansas, especially Northwest Arkansas.

First, I would like to discuss water quality, an area that is not traditionally considered "infrastructure". Failure to implement good water quality management policies will result in the decline in the quality of life for residents of Northwest Arkansas. Secondly, I would like to discuss traditional infrastructure needs in the area of flood control, municipal/domestic water supplies, sewage treatment and disposal, and solid waste disposal.

I. Water Quality.

A. Non-Point Source Water Quality

The Commission has recently been assigned the responsibility of the Section 319 program of the Clean

Water Act for non-point water quality by Governor Bill Clinton. The availability of good quality municipal water for processing of food products has attributed to growth in Northwest Arkansas. The area leads the nation in raising confined birds (broilers and turkeys). A major concern deals with non-point pollution and the proper disposal of the wastes produced by the animals. Also, the Commission has targeted this area for the first expenditure of Section 319 funds. This effort will concentrate on the monitoring of streams to determine the effectiveness of voluntary Best Management Practices. I would recommend that increased cost-share assistance be made available through USDA Agricultural Stabilization and Conservation Service and that the federal participation under the Section 319 program be increased from the current 60/40 federal/local to 75/25.

The Commission and the U.S. Army Corps of Engineers ("Corps") - Little Rock District are in the process of completing negotiations of a local cost-share agreement concerning the Beaver Lake Study. The purpose of the study is to monitor the quality of water in Beaver Lake as Best Management Practices for animal waste disposal are implemented. Also, the lake is the subject of a Clean Lakes Study by the Environmental Protection Agency ("EPA"), ADPCE, and the Commission. A major concern of the Commission was to structure these studies to insure that information would be interchanged and no duplication of effort would occur. We have identified several other lakes, such as Lincoln Lake and Lake Francis, where a study would be beneficial. I would request that the Committee insure that adequate funding be made available for these studies and that any recommendation made be implemented.

Northwest Arkansas is not blessed with abundant ground water. The water that is available is of poor quality. A major concern is the recent findings that indicated some of the ground water used in municipal water systems has unacceptable levels of radium. A cooperative effort involving several state and federal agencies is underway to try to determine the source of radium and what can be done to help the many small communities in Northwest Arkansas that depend upon ground water for drinking water supplies. Other activities in this area include the hydrologic study of the shallow aquifers of Northwest Arkansas, which is a cooperative effort including the U.S. Geological Survey ("USGS"), the Commission, and the local Conservation Districts. The USGS is also beginning a National Water-Quality Assessment Program ("NAWQA") for the Northwestern Arkansas area. I would recommend that funding for this study, as well as assistance for resolving the problem be made available.

B. Section 404 of Clean Water Act

With recent inclusion of wetlands under the Clean Water Act, definition of waters of the United States has greatly increased the importance of Section 404 permits in the construction infrastructure. President Bush's "no-net loss" wetlands policy has confused the area further. As the Clean Water Act is re-authorized, it is necessary that Congress address what wetlands are and what actions we are willing to take to protect wetlands. I believe that it would be in the national interest to concentrate wetlands protection on the highest quality wetlands, while exempting converted wetlands currently in agricultural production from Section 404 permitting requirements. Programs such as the Conservation Reserve Program should be considered to protect wetlands. In the case of the highest quality, out right purchase in fee, simple or permanent easement should be considered. I think programs such as these will help reduce the landowner's concern that the current program is a "taking without just compensation".

In the mean time, I would suggest the following as methods to increase the effectiveness of current programs:

(1) Insure that the Corps offices have necessary staff to timely process the applications.

(2) Let applicant know what is required of him as early as possible in the permit process.

(3) Use existing Conservation Districts, USDA Soil Conservation Service ("SCS"), and state university cooperative extension offices to assist getting information to the public. Have those personnel knowledgeable of Corps program and able to assist in making permit applications.

(4) Develop "nationwide" permits to reduce work load and time to issue permits on such activities as wastewater treatment lagoons.

II. Traditional Infrastructure.

A. Flood Control/Drainage

The requirement of local cost-share on water development projects make needed flood control/drainage projects very burdensome on local interests trying to develop the needed improvement. Many water development projects cannot be built or must be significantly scaled back because of the local cost-share requirements.

The Water Resources Development Act of 1986 required the local cost-sharing of water development projects with the philosophy that the local sponsor would be a full partner in any decisions with respect to the project. My experience as a project sponsor in negotiating a local cooperation agreement for the construction phase has not reflected full partner status. I would submit that cost-sharing requires a commitment to shared decision-making as well. Local sponsors must be regarded as full partners in the study, design, and construction of water resource projects if they are required to finance in part or full the costs of such projects.

Projects being impacted by this requirement within the State of Arkansas include: *Fourche Bayou Flood Control Project* in Little Rock/Pulaski County ($11,162,000 non-federal); *Eight Mile Creek Flood Control Project* in Paragould/Greene County ($4,914,000 non-federal); *Dark Hollow Flood Control Project* in North Little Rock/Pulaski County ($4,110,000 non-federal); and, *Ten and Fifteen Mile Bayous Flood Control Project* in West Memphis/Crittenden County ($13,500,000 non-federal). Many small watershed and water quality projects are also being impacted.

It would be my recommendation that the fifty percent (50%) cost-share requirement be eliminated or reduced within the state. These projects undertaken by the Corps and SCS offer a great opportunity to improve the quality of life within Northwest Arkansas by reducing flooding and improving drainage.

B. Water Supply

It has been estimated that over 400,000 Arkansans still do not have access to an approved public water supply. Dr. Joycelyn Elders, Director of the Arkansas Department of Health, has stated, "One of the most important things that the Arkansas Department of Health can do to improve public health is to insure the availability of a clean, safe public water supply." At this time, there are approximately $93,000,000 in requests for financial assistance for development of rural water supply and distribution facilities on file with the Farmers Home Administration. At best, under current levels of funding, state and federal agencies will be able to provide less than half of the need.

Additionally, most of the assistance available from these sources is in the form of loans. A typical project may have a total cost of $400,000 to serve 100 homes. Using funds from the Arkansas Water Resources Development General Obligation Bond Program, with no grant, the monthly water bill will average $39.00.

To help relieve this problem, I would recommend that levels of assistance to the state through the Farmers Home Administration's Community Development Program and Department of Housing and Urban Developments Small Cities Program be increased. Also, recent tax codes have made it much more difficult and expensive for localities within Northwest Arkansas to raise funds using tax-exempt financing. The arbitrage and rebate requirements have placed an accounting burden on local governments. I recommend that the Committee review the current arbitrage requirements and consider raising the current $5,000,000 issue exemption.

C. Wastewater Treatment/Sewage Disposal

Clean water is essential to the continued development of Northwest Arkansas, but the cost of clean water has become a burden. One hundred and forty-six (146) entities in Arkansas have expired NPDES permits with 35 such entities located in Northwest Arkansas. These communities must make substantial improvement to comply with new permit standards. At the same time, EPA Construction Grants have been phased out and replaced by a revolving loan program with many federal requirements that add additional costs.

The burden imposed by water quality needs can be demonstrated by the following example: *A typical community in the state may require sewage treatment improvements with costs exceeding $2,000,000. With EPA grant funding, as in the past, the average monthly household sewer fee would be $20.00. With the Revolving Loan Funds, the monthly fee would be $32.00, and with a revenue bond issue $37.00.*

It should be noted that many areas within Northwest Arkansas are not sewered. To improve the quality of life and encourage development in the state, it will be necessary to develop a sewer system and to properly treat the waste collected. The ADPCE has estimated that the present day costs to build sewer collection systems in non-sewered areas and to bring sewage treatment levels to the current standards would cost in excess of $500,000,000.

It would be my recommendation that additional grant funds for wastewater collection and treatment be made available, that tax laws be reviewed for the impact on localities using tax-exempt financing and that Title II requirements under the EPA's revolving loan fund be relaxed so that localities might economically construct improvements under that program.

D. Solid Waste Disposal

Proper disposal of solid waste is essential to continued development of Northwest Arkansas and the state in general and is essential to prevent contamination of groundwater. However, the cost of solid waste disposal either by landfill, composting or recycling has escalated to the point of becoming a tremendous burden. In addition, the karst geology of Northwest Arkansas makes disposal of solid waste and animal waste by landfilling difficult and expensive due to the danger of pollution of the shallow ground water and surface water in the area.

Out of the seventy-five counties in the state, eighteen counties have no landfill at all, forty counties have landfills with less than five-years capacity remaining and fourteen counties have closure plans for their present landfills. Recent legislation has established eight solid waste districts over the state for the purpose of addressing solid waste needs on a regional basis. The intent of this legislation is to create cooperation of rural towns and counties for proper disposal of solid waste in the most economical manner. The economical burden imposed by proper disposal of solid waste will result in costs of household garbage fees in the range of $6.00 per month being raised to $15.00-$16.00 per month. It is anticipated that some of the costs can be eliminated by establishing markets for recyclable materials. ADPCE has prepared a rough estimate of solid waste needs statewide of $240,000,000-$320,000,000 based on anticipated changes to federal regulations. Studies are presently being made to more accurately determine the overall needs and associated costs.

It should be noted that proper disposal of solid waste within Northwest Arkansas may require more recycling, composting and incineration to eliminate shallow ground water pollution.

It would be my recommendation that additional grant funds be made available not only for regional study of needs but construction of facilities and purchase of waste handling equipment as well. Also, tax laws should be reviewed for the economic impact on local and county governments that desire to utilize tax-exempt financing.

Respectfully submitted,

J. Randy Young, P.E.

CHAIRMAN ANDERSON AND MEMBERS OF THE COMMITTEE

My name is Robert A. Young. I am President and Chief Executive Officer of Arkansas Best Corporation and its primary subsidiary, ABF Freight System, Inc., headquartered in Fort Smith, Arkansas.

ABF is a common carrier of general freight specializing in shipments weighing less than 10,000 pounds, or less than truckload (LTL) freight. ABF revenues for 1989 were more than $630,000,000 and we ran more than 200 million miles last year. We are currently averaging about 20 million miles a month or almost 1 million miles a day. We have 316 terminals located in all 50 states, Puerto Rico, and in five provinces of Canada. ABF employs about 10,000 people.

My primary interest is, as you might have guessed, in the repair and expansion of our highways.

Our nation's highways are the vital link that allows the movement of 85 percent of all furniture, fixtures, and appliances to market. In addition, 80 percent of all food, rubber products, and plastic goods produced in the USA move by truck. Over 70 percent of all lumber and wood products and an equal amount of steel, sheet metal, cable, wire, pipes, and rods move over our nation's highways.

In Arkansas, we have the communities of Almond, Tomato, Strawberry, Grapevine, and Appletown to whet your appetite. We also have towns named Ben Hur, Pocahontas, Jefferson, Lincoln, Madison, and St. Francis. Right here in Arkansas you can visit Atlanta, Boston, Cleveland, Bismarck, Hollywood, Austin, Houston, Denver, Salem, and West Point. These communities all have one thing in common. They are all served daily by truck. Trucks serve all communities in the United States and two-thirds are served only by truck.

When one considers that most of America is dependent on truck transportation, it is a bit disturbing to learn that 60 percent of the miles of paved highways in the U.S. need some form of surface rehabilitation. More than 40 percent of U.S. bridges over 20 feet long are either structurally deficient or functionally obsolete. Most of us are aware of the serious congestion in our urban areas.

It has been estimated that by the year 2005 traffic delays caused by inadequate roads will cost the U.S. $50 billion a year in lost productivity and wasted fuel.

The impact of inadequate highways here in Arkansas is substantial. Narrow, two-lane, twisting, turning federal highways are the only route into the Fayetteville, Springdale, and Rogers area from Fort Smith. This corridor is the fastest growing part of the state. By-in-large, most of the state's highways are narrow, two-lane, twisting, turning roads with dangerously narrow bridges.

As a substantial user of the nation's highways, I would like to see the following happen:

1. More interstate highway miles should be authorized. Right now there are 4,400,000 miles of highways nationwide and the 155,000 miles of interstates carry 45 percent of the traffic. Only 3.5 percent of the total highway miles carry 45 percent of the traffic.

2. Spend the money now available in the Highway Trust Fund to repair existing highways and bridges.

3. Gradually triple the amount of money being spent on highway research so that with new construction we get longer lasting pavement. I am told that two inches of additional thickness in concrete pavement would double its lifespan and add only 3 percent of the cost of a new highway. Spending more on the front end could reduce the never ending, inconvenient, and dangerous repair of our highways. We need research to tell us how. We should consider setting up ten different research centers, each governed by a board composed of representatives of five different state highway departments. Research done by these ten geographically dispursed research centers could focus on different soil types and different climate factors that affect highway construction techniques and longevity of the pavement.

4. Once we begin to reduce the growing balance of the Highway Trust Fund, a planned gradual increase in highway fuel taxes should be considered for new construction. As has been shown recently in several states,

highway users will willingly pay more fuel taxes if we know it will result in better, less congested roads. Because highways take us from state to state, it is appropriate for our federal government to provide the leadership, matching dollars, and oversight for an expanded national system of safe, productive highways.

If our industry is to compete effectively in a worldwide marketplace, our far-flung nation must have safe, efficient, convenient transportation.

Thank you.

zaew

Committee on Public Works and Transportation
One Hundred First Congress
U.S. House of Representatives
Glenn M. Anderson, Chairman
Washington, DC 20515

Dear Mr. Anderson:

The Northwest area is recognized as the most rapid growing region in Arkansas. Much of the growth is attributed to the livestock and poultry industries.

For some time Arkansas has led the nation in the production of broiler chickens and ranks near the top in number of swine, turkeys, eggs, and beef.

The terrain of this area produces a rapid runoff that flows into high quality streams, rivers and lakes. The numerous water bodies that lie within the region provide water for domestic use, industrial supplies, recreation, and livestock. With respect to nitrates and the presence of fecal bacteria, some private domestic use wells are exceeding current Arkansas Health Department standards.

The Beaver Lakes Demonstration Project is an example of the many groups and government agencies joined with farmers to put forth programs that will reduce the non-point source water pollution coming from agricultural operations in the various watersheds. Table Rock Lake Watershed is now experiencing many of the same problems. These problems can be effectively reduced with additional technical and financial assistance.

It is evident when looking at the production figures in Northwest Arkansas, that animal wastes and their disposition are becoming increasingly important in the overall picture of agriculture.

A continuing partnership of all those involved in resource management will be needed to address and deal with the water quality issues and economic development needs of Northwest Arkansas.

We at the Arkansas Association of Conservation Districts support the continued funding of ongoing projects and ask that the level of support you have shown in the past be continued.

To: Committee on Public Works and Transportation

Thank you for the opportunity to present my thoughts on the needs of our infrastructure here in Northwest Arkansas.

Benton and Washington Counties are a core area in the Western Ozark area and, as the preliminary census shows, we have grown at a very substantial rate. While many places in the U.S. have experienced this same fact, they have in most cases been linked to Interstate Systems.

Currently, this area moves an enormous amount of foodstuffs to the domestic as well as the foreign markets. By the very nature of the product it must move by truck and there is an inadequate highway system for this activity.

Another factor in highway upgrades or new construction is in relation to the military activities at Fort Chaffee. The Interstate System was originally conceived as a system of military roads in the event we ever needed mass troop and equipment movement. While we have been blessed to not have to use the system in a major crisis, there are still a large number of military convoys that enter Fort Chaffee from the north on a totally inadequate roadway.

When U.S.71 is eventually brought to Interstate standards, many trucks will find it safer to route through Ft. Smith on their movement westward. Please consider the excess fuel usage that could be abated by completing a link from Springdale to Siloam Springs, Ark. which would allow a safe passage for thousands of trucks entering and leaving this area and thereby reducing the need to go 60 to 80 miles out of their way on a westward trip.

Another factor I would like to see considered is a change in Federal Law that would allow the building of toll roads without having to maintain a free road in close proximity and allow Highway Trust Funds to be used on toll road construction.

Thank you for your attention

Sen. Joe E Yates

WRITTEN COMMENTS

SUBMITTED TO

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

ON

FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

By

Kenneth F. Steele
Director
Arkansas Water Resources Research Center
113 Ozark Hall
University of Arkansas
Fayetteville, AR 72701

I attended the hearing held in Springdale, Arkansas on September 8, 1990 and am submitting these written comments because of the Committee's interest in our water resources.

The testimony at the meeting on water resources receives my support. However, there seemed to be a major gap in the testimony concerning research. My definition of research includes applied research that can be used in decision-making. Several persons (Messrs. Starr, Young and Mitchell and General Genega) made comments concerning the protection of our surface and ground water from pollution. Much of the potential contamination of our rural water is from agricultural activities (nonpoint source contamination), especially animal wastes. We need research to determine the degree that best management practices (BMP's) effect water quality. Site conditions, e.g. type and amount of vegetation, slope, geology, soil and meteorological, can change the effect of BMP's on water quality. The government has supplied some funding for this type of research (e.g. Beaver Lake Study by U.S. Corps of Engineers and Arkansas Soil and Water Conservation Commission, and Clean Lakes Study of Beaver Lake). These types of studies need to be continued and funding increased in the future. It is important that we provide funds to protect our water supplies rather than to attempt costly remediation programs.

We do not know enough about the ground resources of our state and this is especially true for northern Arkansas. We need to know more about the entry of surface water into the ground water system (recharge) and chemical changes in the water as it moves through the soil and rock. We need to know what happens to hazardous chemicals that may be spilled along highways and railways. Which direction is the ground water, and therefore the chemical, moving?

Which wells will be affected? This same type of information will be useful in locating solid wastes facilities and industries that utilize hazardous chemicals. This basic information would be useful in emergency response to toxic releases. Also detailed information on ground water quantity is critical for planning. At the moment this type of information is not available, thus planning is made somewhat in a vacuum.

There are problems associated with some of the deep ground water wells in northern Arkansas. Although these wells provide large quantities of water suitable for small communities, they often contain radium values from natural sources that exceed U.S. Environmental Protection Agency drinking water maximum contamination limits. These wells are expensive to drill. Research could delineate the depth and areal extent of the radium contamination.

In summary, continued and expanded funding of nonpoint-source water quality studies (including research) are necessary to protect surface and ground water from contamination. Basic research on the hydrology of a region will provide information that is critical for planning. Development of the best water supply systems and protection of these supplies require knowledge of both surface and ground water quantities, qualities and movement. The Federal Government's contribution to studies to gain this type of information is critical, especially to Arkansas. The State supplies some funding, but Arkansas finds it difficult to obtain the matching funds necessary to obtain the Federal dollars much less providing additional State funding.

August 27, 1990

Honorable John P. Hammerschmidt
U. S. Representative
2207 Rayburn Building
Washington, D. C. 20515

Dear Congressman Hammerschmidt:

I am truly sorry that my schedule would not allow me to testify at your hearing in Springdale on September 8, 1990. Your aide, Bob Bergman, stated however that I should write my comments and have them read and recorded at the Springdale hearing.

It is requested that the attached letter to BG Lee be made a part of your September 8, 1990 record. I believe that this letter, and the speech which I gave in Dallas on June 28 (a component of the letter), will help to explain to you how this Commission feels about the impact of high water (flooding) on the navigation interests of the Arkansas River.

You can't eliminate flooding on the Arkansas but with prudent water management you can lessen the impact of flooding on the people living and working in the Basin. Better water management will require study by the U. S. Army Corps of Engineers and this gets down to a determination of whether it would be in our best interest to have the needed study under the existing study authority of whether to seek new authority. My experience with Corps' studies tells me we should use the present authority. I am attaching the response by BG Genega to the BG Lee letter mentioned earlier. BG Genega's letter identifies the study authority issue.

Flood control is a tricky business and the Corps does a good job in this murky area. The flood of March-May 1990 was not an exception but had the Corps had the authority to release water in the range of 300,000 cfs as opposed to 150,000 cfs, logic tells you the navigation and other interests adversely impacted would have been "out of action" for a shorter period of time. A thorough Corps short duration study of the affect of high water on navigation is requested since it would perhaps answer the "out of action" time question.

It is hoped that Charles Maynard, Col USA (ret'd), will represent the Commission at your September 8, 1990 hearing and will read this letter and make added oral Commission comments regarding the flooding issue.

BG Robert C. Lee, Division Engineer
Southwestern Division, Corps of Engineers
1114 Commerce Street
Dallas, TX 75242-0216

Dear ~~General Lee~~ Bob:

Re: The AR Waterways Commission's presentation by Mr. Phillips in Dallas on June 28 at the AR River Basin Coordinating Committee. A copy of the presentation is attached.

It is requested that the U. S. Army Corps of Engineers, Southwestern Division, continue studying the possibilities of reducing the impact of flooding in the AR River Basin on farming, navigation and other interest groups. Specifically we want you to study and tell us the added federal costs of:

(1) evacuating the System's controlled areas at a faster rate than the present 150,000 cfs.
(2) securing any needed flowage easements, lands, raising any needed levees or building additional levees to support the more rapid evacuation suggestion.

This request is made in light of the duration (approximately 90 days) of the last flood and its effect on the farming, navigation, social and recreational interests in Arkansas and Oklahoma.

The continued study effort must take into account the taper period which is an essential component of the evacuation plan since the navigation channel and river banks must be in place when the taper is completed.

It is suggested that the study be phased. The initial effort should tell us "yes" or "no" as to the practicability of the request. The second phase would get to the specifics. Your comments as to a completion date would be appreciated.

Sincerely,

Jim

James H. Phillips
Executive Director

SPEECH - DALLAS, TX

June 28, 1990

I want to thank you for calling this meeting and affording all of us present the opportunity to discuss our Arkansas River problems with you.

The problem I want to identify and ask for its solution is high water. However, I want all present to clearly understand that the most serious issue we have and will have on the Arkansas River is the low water problem. Please remember that it will take four years to construct a lock and dam at Montgomery Point and until that is done the entire system is at risk.

Our high water problem is crucial but it is believed that it can be corrected with administrative action and a minimum of new work. The time required for this depends on our ability to identify the problem, the Corps study time and the ability of those of us present to turn up the political heat that causes the Corps to respond.

The Arkansas Waterways Commission believes that the existing Arkansas River Comprehensive Study authorization is the vehicle that should be used by the Corps to study the optimum rate of floodwater releases in the Arkansas Basin. We know about and have read your Arkansas River Basin Water Control Master Manual and we believe you faithfully followed it during the most recent flood. Further we are publicly stating that you did a good job with your releases -- your text worked. Your efforts should be applauded.

I do want to go on and say that the flood started on or about 1 March and it was well after 1 June before things started to approach business as usual for the farm interest and later still for the navigation interest in Arkansas and Oklahoma. The Commission of which I am the Executive Director want serious thought given to reducing the floodwater evacuation time because this impacts navigation which is our State responsibility.

-- continued

Your River Basin Plan says that normally no more than a stream of water (150,000 cfs) will be released from the structures in the controlled areas and, in turn, pass Van Buren. These releases will bring the water to about 22' (floodstage) at/or below Ft. Smith. At present if you exceed these releases there will be agricultural lands damaged and some damage to property. We also know that your ability to make up-stream releases far exceeds your ability to control the water below Ft. Smith. We also know that all interests in Arkansas had a lot rather be flooded for the minimum time possible rather than dragging it out. However following our flooding we want the System operative and we don't want to clean it up for another period of time during which the navigation interests cannot use the system. We believe that you have the capability to achieve these goals e.g., evacuate the floodwaters quicker yet leave the channel and banks in good shape.

With study it is believed that you can and should step up your releases to the point that though increased there would not be channel and bank damage below Ft. Smith while passing the added quantity of floodwater.

Hopefully your 90 day crash study effort will indicate that greater floodwater releases can be made below Ft. Smith without channel and bank damage if the Corps: purchases more land or flowage easements; raises the elevation of existing levees and constructs added levees.

If all or some of these changes are made it is believed that it would enable the Corps to raise the floodstage of the AR River at Ft. Smith above 22' which would hasten the flood control evacuation. The task must be done without significant damage to the channel or banks by the floodwaters.

-- continued

The evacuation of the controlled areas must be closely coordinated with the needs of navigation since we all know that floodwater releases result in sediment buildups in the channel which can only be moved with a "taper" or dredging following the evacuation.

Your "taper" requires 21 days and approximately 16% of the floodpool storage capacity. This means that you seldom complete a taper without some approval to the districts by your headquarters. It also means that you almost always start the taper too late and with too little water left in the floodpool.

Your taper runs between 40,000 and 20,000 cfs. This starts at too low a level and it doesn't get the job done. Study starting the taper at around 60,000 cfs and holding at this bench level before moving on down to your lower release levels.

Your study effort will identify national issues right up front and don't be bashful about identifying them e.g. "NO FEDERAL INTEREST IN LEVEES"; the taper drops into the power pool; how do we handle up stream versus downstream problem etc. Tell us the impacts and costs of raising the flood stage below Ft. Smith to 24'; 26' etc., but don't study the problem for nine years like the Montgomery Point Lock and Dam issue.

IN SUMMARY: Study and cost how the floodwater above Arkansas can be released quicker but leaving the channel and banks below Ft. Smith without significant damage and not filled with sediment. Thank you for the opportunity to speak and good luck on your next assignment.

REPLY TO
ATTENTION OF:
Executive Office

Mr. James H. Phillips
Executive Director
Arkansas Waterways Commission
1515 West Seventh Street, Suite 305
Little Rock, Arkansas 72201

Dear Mr. Phillips:

I would like to take this opportunity to thank you for your participation in the Arkansas Coordinating Committee Meeting. Your continued input to this committee is valued as we continue to review and refine operation of the Arkansas River Basin system for the benefit of the various project purposes for which they were authorized. General Lee felt that the committee provides a valuable sounding board for the various basin interests and I am looking forward to continuation of the committee meetings.

The study you proposed in your speech to the committee on June 28, 1990, and in your recent letter to General Lee, will involve hydrology studies, benefit/cost evaluation, and environmental analysis of several items which would be effected by increasing the controlled flow rate at the Van Buren, Arkansas gage. A series of flow rates above the 150,000 cubic feet per second (cfs) would need to be considered in the evaluation with the following effect for each flow:

a. Additional flowage easements for the land that would be flooded at the higher controlled flow rates.

b. New or improved levees to protect developed areas and facilities where flowage easements could not be obtained.

c. Impact of the higher sustained flows on the navigation system (i.e. channel and bank damage, effect on training structures which have been designed and installed based on the present flow criteria, etc.).

These studies would most likely require several months of effort and could be accomplished under the existing Arkansas River Basin, Arkansas and Oklahoma, Feasibility Study authority, if modifications of the existing Feasibility Cost Sharing Agreement were executed by the study sponsors and additional study funds were provided. However, the feasibility study is essentially complete. A Feasibility Review Conference was held last April to determine what report revisions would be required before it could be released (scheduled for this fall) for public review and comment.

The study sponsors and other interested groups are eagerly awaiting the results of the feasibility study. Accordingly, it would be preferable for the studies to be accomplished under a new study authority. If you will contact Mr. Ken Carter, Chief of the Planning Division, Little Rock District, he will assist you in preparing the appropriate study request.

I am looking forward to meeting with you and the Arkansas Basin Coordinating Committee in the future. In the meantime, if you have additional concerns feel free to contact me.

Sincerely,

Stanley G. Genega

Dear Chairman Anderson:

As a member of the Northwest Council, let me please express to you our appreciation for your presence and for the presence of the other members of the Public Works and Transportation Committee in Springdale, Arkansas.

We were pleased to be able to demonstrate to you the substantial progress made in Washington and Benton counties, Arkansas within the last 20 years and the extreme strain that it has caused on our highways and airport system.

Yours truly,

John R. Elrod

Dear John Paul:

Congratulations on what I understand was a very successful hearing in Springdale last Saturday. I am sorry that a previous commitment kept me from attending.

I had prepared, on behalf of the American Consulting Engineers Council, a statement that I had planned to enter into the record. Unfortunately, through a mixup in the mails, I was unable to do so on Saturday.

I understand that the record is being held open for a period of 30 days. Consequently, I am enclosing 10 copies of my statement and would appreciate it very much if you would see that it is entered.

Again, congratulations on an excellent hearing. I look forward to seeing you in the near future.

Cordially yours,

Carl

CARL YATES, P.E.

before the

House Public Works and Transportation Committee

on

The State of Our Nation's Infrastructure

September 8, 1990

"Serving the Business and Professional Interests of American Consulting Engineers Worldwide"

Mr. Chairman and members of the Committee, my name is Carl Yates. I am President of McGoodwin, Williams and Yates, Incorporated, a consulting engineering firm in Fayetteville, Arkansas. I want to commend Congressman Hammerschmidt for holding this hearing and for his commitment to developing Arkansas's and this nation's infrastructure. I appreciate the opportunity to submit this statement for the hearing record.

I am also a member of the American Consulting Engineers Council, a national professional association representing 5,000 private-practice engineering firms. Our member firms employ some 160,000 engineers, scientists, technicians and other, and annually design over $1000 billion in public works and private-industry facilities.

Included in your briefing books should be a list of infrastructure projects that are needed by Northwest Arkansas, if our businesses are going to be successful and profitable. While all areas of infrastructure are essential, I would like to focus my remarks on the work that ACEC has done in the area of transportation infrastructure.

As trained professionals, consulting engineers are regularly confronted with problems requiring special solutions. If there is a common vision that we share, it is that the economic, social and, yes, even political well-being of this great nation depends, in part, on our commitment to and investment in America's transportation infrastructure.

Most of us agree that the condition of our interstate and primary road system, railways and airways are indicators of our productive capacity and continued national prosperity. But does our social and political well-being depend on the health of our infrastructure? Let's examine these ideas for a moment.

Social well-being can be defined as that condition in which communities are in balance, happy and healthy. Political well-being can be defined as that condition when citizens feel free, well-governed, and unconstrained. Along with education and freedom of expression, Americans also value the freedom to travel. Whether for business or pleasure, we expect to be able to move about freely at a reasonable cost, in great safety and without restrictions.

It is precisely these "well-beings" that are threatened by our systematic neglect and disregard for our decades-old investment. We are not only eating the "seed corn" of our infrastructure capital; we may be letting it rot in the field, as deficit reduction negotiators consider balancing the Federal budget with the transportation trust funds. If the trust is lost in these funds, we may never persuade the American people to support a motor fuels tax increase for future needs. Without the trust funds, we will be unable to maintain what we have or to plan for the next generation of transportation investments.

As you know, engineers love facts and statistics; let me cite just a few that I am sure you have heard before to set the context for the balance of my remarks.

Nearly one half of all bridges in the United States are deficient.

> By the year 2000, approximately 7.5 billion gallons of gasoline will be wasted due to traffic congestion alone. What used to be a 20-minute drive to work in most urban areas is now a one- to one-and-a-half hour trip.
>
> It is estimated that it will take $1 trillion by the year 2000 and $3 trillion in the next 20 years just to replace and repair our current infrastructure. This figure does not include the cost of building new facilities.
>
> One final statistic -- The last major airport constructed in this country, Dallas Fort Worth, opened 15 years ago. Fortunately the people of greater Denver approved a successor to Stapleton last year.

The list goes on. The problem has been well-defined and documented. The solutions, for us, are all too obvious. But still, not enough is being done.

U.S. industry as a whole has lost the competitive advantage which made this nation the world's greatest economic leader. The U.S. trade deficit hits record highs every quarter, and each year the interest payment that Americans must send overseas to finance the deficit rises. What can be done about it?

The U.S. industrial sector must rebuild if it is to regain its share of world trade. Numerous remedies have been proposed -- improved management techniques, flexible manufacturing, and additional education, research and development. Much attention already has been given to the role that the modernization of factories plays in spurring economic growth. Now the focus must shift to the role that infrastructure plays in enhancing the quality of everyday life. Greater public awareness must be attained concerning the integral part that public facilities play in maintaining our nation's economic competitiveness.

In the 1960s, the net investment in public works by federal, state and local governments averaged 2.3 percent of gross national product. By 1984, this figure had dropped to a mere 0.4% of GNP. This decline has had a tremendous, but, until recently, largely unassessed impact on our nation's economy. David Auschauer assessed the relationship between our nation's overall productivity and the diminishing infrastructure investment. He described in economic terms what we knew but could not prove - that the decline in public investment as a percentage of GNP was having a negative effect on our nation's prosperity and our ability to compete in the world market. Auschauer demonstrated that each percentage point increase in the public capital relative to private investment produces a one-third percent increase in the productivity index.[1] Auschauer also cited European data to show a relationship between public investment and productivity among the "Group of Seven" countries - the U.S. and our six primary trading partners. The results indicated a decline in our national productivity and prosperity. The US has fallen to seventh place behind not only Germany and Japan, but also France, the UK, Canada, and Italy. In fact, Italy, with a far weaker overall economy, outdistances all but Japan in productivity, largely because their infrastructure investment is more than 4% higher than the average of the last twenty-five years. Ours is below 1%.

The documented impact can be frightening. For example: urban traffic congestion has increased 15 percent in the last decade. This means that if a worker is delayed twenty minutes each day in traffic congestion, by the end of his career he will have wasted two years' time sitting in a car in traffic. It is estimated that today's average big-city commuter will spend six months of his lifetime waiting for red lights.

---

[1] Auschauer, David A., " Rx for Productivity: Build Infrastructure", Chicago Fed Letter, Federal Reserve Bank of Chicago. No. 15, September, 1988.

The American economy suffers when infrastructure investment declines. The damage, however, is not irreversible. The United States must renew its commitment to maintaining our transportation system as the finest in the world and prepare for the challenges of the 21st Century.

There have been some positive developments in recent years and progress has been achieved on several fronts.

After concluding that the quality of America's infrastructure was barely adequate to meet current requirements and insufficient to meet the demands of future economic growth, the National Council on Public Works Improvement, a joint council appointed by Congress and the President, outlined a strategy for getting to the root of the problem. The Council's recommendations included a national commitment, to be shared by all levels of government and the private sector, to increase capital spending by as much 100 percent.

If you recall, the Council also advocated that we:

- Clarify the respective roles of state, local and federal governments in the design, construction and management of infrastructure in order to focus responsibility and increase accountability.
- Allow spending of the federal highway, transit, and airport trust funds for their intended statutory purposes.
- Finance a larger share of the cost of public works through user fees.
- Remove the unwarranted limits on the availability of tax-exempt financing for state and local self-help efforts. ACEC is actively pursuing this goal through the Environmental Infrastructure Bond Act of 1990, (co-sponsored by Senators Domenici, Boren, and others.)
- Support additional research and development to accelerate technological innovation and to train

public works professionals. A major study on the impact of R&D cutbacks on the decline of federal infrastructure funding is under preparation by the U.S. Office of Technology Assessment.

- And, develop a rational capital budgeting process at all levels of government.

The U.S. Department of Commerce estimated that infrastructure use by industry alone would increase by 30% during this decade. As a result, the Council report recommended that users and other beneficiaries pay a greater share of the cost of infrastructure services.

Action is being taken on these recommendations.

ACEC is also a driving force behind "Rebuild America," a coalition dedicated to making infrastructure repair and rebuilding a top national priority. As you know, "Rebuild America" includes such public and private organizations as the American Consulting Engineers Council, the American Institute of Architects, the American Society of Civil Engineers, the Associated General Contractors of America, the National Association of Home Builders, and the Public Securities Association. Other members include the American Public Works Association, the National Association of Counties, the National League of Cities, and the U.S. Conference of Mayors.

Like the National Council on Public Works Improvement, "Rebuild America" seeks to make progress in the areas of capital planning, creative funding strategies, improved management and technological innovation. It's legislative goals are forthright:

- There should be no further funding reductions in existing federal programs that address infrastructure needs.

- Existing federal infrastructure trust funds must be continued, adequately funded and fully expended for their intended purposes.
- Restrictions on the use of tax-exempt financing for infrastructure must be eliminated.
- A federal capital infrastructure program is needed to provide assistance to states and localities to meet infrastructure needs
- And, a federal, long-term, multi-capital budget must be established if these efforts are to be successful.

What else needs to be done to guarantee a solid foundation for the future of infrastructure?

Change can be effectuated and the challenge met. The renewal and reinvigoration of the American infrastructure begins with the hardest step, "breaking friction with your chair." The renaissance of America's infrastructure must begin with the support of the American public. The general populace must come to realize the important contribution a strong transportation system makes to the health of the country.

We must all get involved.

Two months ago, ACEC agreed to cosponsor a proposed public television series about transportation in America. WETA, a Washington, D.C.-based television producer is soliciting financial support for the four one-hour series entitled Coming and Going. The series would be aired by the Public Broadcasting Service - which reaches 98 percent of America's households. On an average week, 52 million households tune-in to PBS.

Finally, the consulting engineers will continue to work with you, our Representatives, in Congress. Your understanding of the problem and commitment to our nation's infrastructure has been tremendous. Your doors have always been open to us. We must continue to work with your colleagues and with those who are instrumental in shaping our nation's priorities and policies to educate them on the need for improving our infrastructure. I would like to single out Congressman Hammerschmidt for his leadership and commitment to his constituents.

I would be happy to answer any questions you may have on the role that consulting engineers will play in restoring our infrastructure.

napco
NORTHWEST ARKANSAS PAPER COMPANY WE'RE MORE THAN A PAPER COMPANY

September 7, 1990

Committee on Public Works and Transportation
United States House of Representatives

Chairman Anderson and Distinguished Members:

When Northwest Arkansas Paper Company came to Arkansas in 1967, we had 5 employees and manufactured 100,000 paper bags per day. Warehousing and manufacturing occupied 5,000 square feet of space and produced sales of approximately $640,000.

Napco has expanded to employ 300 people occupying in excess of 250,000 square feet. The manufacturing company produces more than 5,000,000 bags a day and company-wide revenues are projected to reach $75,000,000 this year. This record growth has made us the leader in the paper distribution industry for our area.

Along with manufacturing and distribution, Napco operates 45 long haul over-the-road tractors in 25 states. Miles in Arkansas for these trucks accounts for over 60% of the total miles driven in these states. In addition, we have 11 bob trucks registered for the four state area. All trucks combined travel over 5,000,000 miles per year, hauling over 96,000,000 pounds of product.

We are not alone in this phenomenon of tremendous growth. We are extremely fortunate to operate in this area of major growth and to be associated with the area's leading companies. Our highway systems, while always improving, have not managed to keep pace with the growth rate of the area. The major routes used to enter and exit the state, including U.S. Highways 71 and 412, have some of the highest accident and fatality rates in the nation. In the history of our company in particular, we have had the misfortune of 2 fatalities among our truck drivers. Both occurred on Highway 71.

Your time and attention to our area needs will be greatly appreciated. We hope the extensive growth in this area will justify special attention.

Sincerely,

William R. Gray
President

Committee of Public Works and Transportation
One hundred first Congress
U. S. House of Representatives
Glenn M. Anderson, Chairman

September 8, 1990

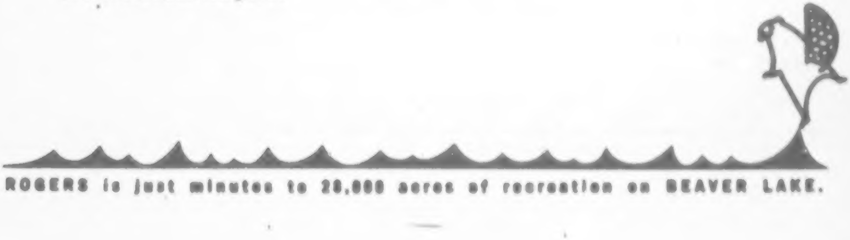
Rogers Chamber of Commerce is pleased to welcome the Committee of Public Works and Transportation to Northwest Arkansas.

The presentation "Addressing the Infrastructure Challenges of the City of Rogers and Northwest Arkansas" centers around providing adequate services for one of the most rapidly growing areas in the nation, unlike many cities in Arkansas. The Rogers Chamber of Commerce is in support of this presentation given to the committee by the Honorable John W. Sampier, Jr., Mayor of the City of Rogers; and by the Northwest Arkansas Council.

The completion of U.S. 71 to interstate standards from Alma to the Missouri line has been a priority of our community for many years. Upgrading this system to Interstate 49 from Shreveport, Louisiana to Kansas City, Missouri is of great importance locally, regionally and nationally.

In order for our region to continue to flourish and be competitive, we must have rapid inter-regional, interstate and intrastate movement of traffic. Most importantly is our concern for the public safety of the motoring public.

Northwest Arkansas definitely needs to be connected to the Cherokee Turnpike via U.S. 412 which would give us an important commercial link with the proposed Northwest Arkansas reliever airport, the Arkansas River Navigation System and the Tulsa International Airport.



We encourage the Committee of Public Works and Transportation to assist Northwest Arkansas in any way possible in its quest for adequate, safe transportation and infrastructure development.

Sincerely,

Raymond M. Burns
Executive Vice President/Economic Development Director

RMB/el

SEARCY COUNTY ARKANSAS

WRITTEN TESTIMONY

For presentation to the Committee on Public Works and Transportation, One Hundredth Congress, U.S. House of Representatives, at the hearing in Springdale, Arkansas, on September 8, 1990.

BACKGROUND

Searcy County, Arkansas, is among the most impoverished counties in the Nation. In 1989, Searcy County ranked 74th of 75 counties in the State of Arkansas for average weekly earnings. Searcy County is among the lowest five percent of counties Nationwide for per capita income.

Our largest industry is agriculture, and most of our farm/ranch operations are small, self-employed owner operations. Employee wage scales in most of our manufacturing, service and retail businesses are at or slightly above the statutory minimum wage.

Searcy County has not been able to attract higher wage industry because of the lack of certain basic infrastructure elements. For example, the County does not have an adequate airport facility, four lane highway access, an economical energy source (natural gas), or a railroad. In recent months, increasing concern has developed regarding the quality and adequacy of our water supply, presenting another negative factor which makes economic development more difficult.

The County is not without positive factors. For example:

1. The County has a sizable, highly motivated work force, that has demonstrated the capability to be very productive in industrial operations;

2. During the past two years the citizens of Searcy County have joined together in an intensive effort to improve the economic and social conditions within the County. Two hundred and twenty-four acres of land has been purchased for development as an airport/industrial park complex. Local efforts have resulted in payment of $210,000 of the $290,000 purchase price of the land,

leaving a current indebtedness of $80,000.

3. Searcy County citizens and former residents are working hard to identify industrial prospects willing to locate in Searcy County and add resources to our industrial base.

4. The County has tremendous potential for development of tourism as a major economic resource.

There are, however, several critical needs, essential to successful economic development, that are beyond our financial reach at the present time. The three most urgent are:

- Construction of an adequate airport;
- Development of a County-wide water system; and
- Widening of U.S. Highway 65 to four lanes within the County.

CONSTRUCTION OF AN ADEQUATE AIRPORT

Phase 1 of a Searcy County Airport Feasibility Study was completed during the summer of 1990. The study was conducted by Coffman Associates, Inc., Kansas City, MO, in association with Grimes Consulting Engineers, Inc., of Little Rock, AR, and was funded jointly by the Federal Aviation Administration, Arkansas Department of Aeronautics, and the Searcy County Airport Commission. The report included a comprehensive analysis of the County's aviation needs, and stated that "a community's airport is a vital link to the mode of transportation that has resulted in greater economic strength and growth for our nation as a whole, and for individual communities, as well". The study indicates that history has shown that the cost of building and maintaining an adequate airport is an investment which yields impressive benefits to a community. Searcy County has already learned that an adequate airport is a vital ingredient for attracting and retaining industry. All of our contacts have stressed the absolute need for an adequate airport as an overriding consideration in factory location decisions. In fact, one industrial operation has moved from Searcy County in the recent past because of the inadequacy of our current airport.

Our consulting engineer estimates that the total cost of constructing a suitable airport is approximately $1.4 million. Searcy County citizens are raising funds to purchase the land. Local contractors are donating their time and equipment to clear the land and help with construction. The Arkansas Aeronautics Commission has provided grants totaling $176,000 for land purchase and construction work. However, Federal funding assistance is essential if this airport is to be completed within a reasonable period.

DEVELOPMENT OF A COUNTY-WIDE WATER SYSTEM

In early 1990, the Arkansas Soil and Water Conservation Commission conducted a comprehensive study of water resources, water needs, and the type of system needed to meet the needs of Searcy County and portions of Newton County. This study was made because of the discovery of radium contamination in several water supply wells throughout the area. Radium levels exceeding the maximum contaminate level of five (5) picocuries per liter has been detected in six wells in the area. As a result, the Arkansas Department of Health has given those systems three years to either remove the radium from the water or develop another source.

Of the various alternatives, a surface impoundment has been determined to offer the most advantages. Utilization of well water as a supply source is still possible, however, the sources of radium contamination are still unknown, and controversies concerning radium treatment and sludge disposal present difficult, if not insurmountable, problems.

A committee of specialists, appointed by the Searcy County Judge, has developed two possible sites for large impoundments, with upper Bear Creek, in the western part of the County, being the most feasible location. This alternative would provide a sufficient water supply to serve all of Searcy County and possibly provide a recreational resource that could substantially enhance the County's attractiveness to industrial prospects and tourists. The elevation would be sufficient to provide gravity flow to all areas of the County and significantly reduce the cost of the water transport system.

The cost of either impoundment alternative is as yet undetermined, but no doubt will be substantial. Federal assistance will be necessary if the current health hazards are to be eliminated, and a safe, adequate water supply developed within the forseeable future.

WIDENING OF U.S. HIGHWAY 65 TO FOUR LANES IN SEARCY COUNTY

U.S. Highway 65 is a primary north-south artery from the midwest to the south and southwest areas of the Nation. It is a major tourist route and traffic increasingly consists of large trucks and recreational vehicles that create congestion and traffic hazards on the narrow two lane roadway.

Several studies have been made and proposals developed that recommend widening the highway to four lanes. However, all known studies contemplate that the Searcy County segment of the highway will remain two or three lanes.

It is obvious to County officials, business owners, and economic development organizations that widening of the highway to four lanes is essential to our growth and the present and future needs of users of Highway 65. We believe a contrary view is shortsighted and that failure to widen the highway will result in increasing hazards, congestion and delays to travelers using this route. Assistance from the Federal Highway Administration will be necessary to develop a realistic plan to correct this situation.

On behalf of the people of Searcy County, we appreciate the opportunity to present our concerns to the Committee. If additional information is desired or questions arise, we urge the Committee to contact the County and economic development officials listed below:

- Honorable Duford Taylor, County Judge
  Searcy County Courthouse
  Marshall, AR 72650
  Telephone 501-448-3554

Rogers
Chamber of Commerce
113 N. 4TH • P. O. BOX 428 • ROGERS, ARKANSAS 72757-0428 • 501-636-1240

September 7, 1990

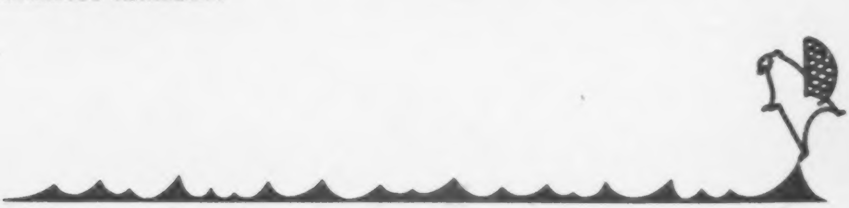
Mr. Glenn M. Anderson, Chairman
Committee of Public Works & Transportation
101st Congress
U.S. House of Representatives
Washington, D.C. 20515

Dear Sir:

We want to take this opportunity to thank you for bringing your congressional hearing on infrastructure to Northwest Arkansas. We believe hearings such as this will give your committee a tremendous insight into the thinking of "Grassroots" America.

Federal funding is critical to solving the infrastructure needs of Northwest Arkansas. The most vital element needed to stabilize the economic base of our area is a dependable, safe transportation system. Our diversified industries, as well as the many nationwide trucking firms with home offices in Northwest Arkansas are dependent upon a safe route for transporting goods and services.

For many years, the highest priority of the Rogers Chamber of Commerce for regional transportation improvements has been the upgrading of U.S. Hwy. 71 to Interstate standards from I-40 at Alma, Arkansas, to the Missouri State line. Sections of this route now carry over 20,000 vehicles per day, and this is the only north-south route through Northwest Arkansas. We realize the improvements to this highway within the past few years have been made possible because of Federal funding authorized through your committee. We also are very well aware that the route cannot be finished without a continuation of the Federal funding. Therefore, we are earnestly soliciting your support for the completion of this route that is so critical to the economy of Northwest Arkansas.



ROGERS is just minutes to 28,000 acres of recreation on BEAVER LAKE.

In addition to the regional impact of Highway 71, we also have many local transportation needs affected by Highway 71. Our inter-city routes that serve as the connecting link from the business district to the completed portion of Highway 71 are presently over-saturated with local traffic. These arterials, U.S. 62 and Highway 71B, are only two lanes in width with inadequate shoulders and no passing lanes. Many of our businesses and industries are located along these routes, and continually experience difficulty with ingress and egress because of the traffic load.

Recently the State of Oklahoma, through its Highway Commission and the Oklahoma Turnpike Authority, began construction on the 32 mile link of U.S. Highway 412 between Chouteau and the Arkansas State Line. This massive construction project is due to be completed by early 1992. With U.S. Highway 412 being a major east-west route from Woodward, Oklahoma to Jackson, Tennessee, it is important that an effort be made to upgrade the fifteen mile section between the Arkansas State line and U.S. Highway 71. This will provide direct access to the Port of Catoosa on the McClellan-Kerr Navigation System, as well as direct access to the proposed reliever airport near Tontitown, Arkansas.

While there will always be infrastructure needs in our area, we believe that we have outlined above the most pressing needs for Federal funding. The cost of highway and airport construction has escalated to the point that without Federal support, we cannot even maintain what we have, much less keep up with the increased transportation demands of a vibrant region such as Northwest Arkansas.

Thank you again for bringing members of your committee to Northwest Arkansas and allowing us the opportunity to provide this input.

Sincerely,

ROGERS CHAMBER OF COMMERCE

Bob H Crafton

Bob H. Crafton, Chairman
Transportation Committee

Local efforts have resulted in payment of $210,000 of the $290,000 purchase price of the land,

leaving a current indebtedness of $80,000.

3. Searcy County citizens and former residents are working hard to identify industrial prospects willing to locate in Searcy County and add resources to our industrial base.

4. The County has tremendous potential for development of tourism as a major economic resource.

There are, however, several critical needs, essential to successful economic development, that are beyond our financial reach at the present time. The three most urgent are:

- Construction of an adequate airport;
- Development of a County-wide water system; and
- Widening of U.S. Highway 65 to four lanes within the County.

CONSTRUCTION OF AN ADEQUATE AIRPORT

Phase 1 of a Searcy County Airport Feasibility Study was completed during the summer of 1990. The study was conducted by Coffman Associates, Inc., Kansas City, MO, in association with Grimes Consulting Engineers, Inc., of Little Rock, AR, and was funded jointly by the Federal Aviation Administration, Arkansas Department of Aeronautics, and the Searcy County Airport Commission. The report included a comprehensive analysis of the County's aviation needs, and stated that "a community's airport is a vital link to the mode of transportation that has resulted in greater economic strength and growth for our nation as a whole, and for individual communities, as well". The study indicates that history has shown that the cost of building and maintaining an adequate airport is an investment which yields impressive benefits to a community. Searcy County has already learned that an adequate airport is a vital ingredient for attracting and retaining industry. All of our contacts have stressed the absolute need for an adequate airport as an overriding consideration in factory location decisions. In fact, one industrial operation has moved from Searcy County in the recent past because of the inadequacy of our current airport.

Our consulting engineer estimates that the total cost of constructing a suitable airport is approximately $1.4 million. Searcy County citizens are raising funds to purchase the land. Local contractors are donating their time and equipment to clear the land and help with construction. The Arkansas Aeronautics Commission has provided grants totaling $176,000 for land purchase and construction work. However, Federal funding assistance is essential if this airport is to be completed within a reasonable period.

DEVELOPMENT OF A COUNTY-WIDE WATER SYSTEM

In early 1990, the Arkansas Soil and Water Conservation Commission conducted a comprehensive study of water resources, water needs, and the type of system needed to meet the needs of Searcy County and portions of Newton County. This study was made because of the discovery of radium contamination in several water supply wells throughout the area. Radium levels exceeding the maximum contaminate level of five (5) picocuries per liter has been detected in six wells in the area. As a result, the Arkansas Department of Health has given those systems three years to either remove the radium from the water or develop another source.

Of the various alternatives, a surface impoundment has been determined to offer the most advantages. Utilization of well water as a supply source is still possible, however, the sources of radium contamination are still unknown, and controversies concerning radium treatment and sludge disposal present difficult, if not insurmountable, problems.

A committee of specialists, appointed by the Searcy County Judge, has developed two possible sites for large impoundments, with upper Bear Creek, in the western part of the County, being the most feasible location. This alternative would provide a sufficient water supply to serve all of Searcy County and possibly provide a recreational resource that could substantially enhance the County's attractiveness to industrial prospects and tourists. The elevation would be sufficient to provide gravity flow to all areas of the County and significantly reduce the cost of the water transport system.

The cost of either impoundment alternative is as yet undetermined, but no doubt will be substantial. Federal assistance will be necessary if the current health hazards are to be eliminated, and a safe, adequate water supply developed within the forseeable future.

WIDENING OF U.S. HIGHWAY 65 TO FOUR LANES IN SEARCY COUNTY

U.S. Highway 65 is a primary north-south artery from the midwest to the south and southwest areas of the Nation. It is a major tourist route and traffic increasingly consists of large trucks and recreational vehicles that create congestion and traffic hazards on the narrow two lane roadway.

Several studies have been made and proposals developed that recommend widening the highway to four lanes. However, all known studies contemplate that the Searcy County segment of the highway will remain two or three lanes.

It is obvious to County officials, business owners, and economic development organizations that widening of the highway to four lanes is essential to our growth and the present and future needs of users of Highway 65. We believe a contrary view is shortsighted and that failure to widen the highway will result in increasing hazards, congestion and delays to travelers using this route. Assistance from the Federal Highway Administration will be necessary to develop a realistic plan to correct this situation.

On behalf of the people of Searcy County, we appreciate the opportunity to present our concerns to the Committee. If additional information is desired or questions arise, we urge the Committee to contact the County and economic development officials listed below:

- Honorable Duford Taylor, County Judge
  Searcy County Courthouse
  Marshall, AR 72650
  Telephone 501-448-3554

- Mr. Neil Wilkins, Sr.

WASHINGTON COUNTY SOIL AND WATER CONSERVATION DISTRICT
35 EAST MOUNTAIN, FEDERAL BUILDING ROOM 312
FAYETTEVILLE, AR 72701

September 8, 1990

Committee on Public Works and Transportation
U.S. House of Representatives
(Infrastructure Needs)
Springdale, Arkansas

STATEMENT OF DELFORD RIEFF
CHAIRMAN OF THE WASHINGTON COUNTY CONSERVATION DISTRICT

Glenn M. Anderson, Committee Chairman
John Paul Hammerschmidt, Ranking Republican Member

The Washington County Soil and Water Conservation District is greatly concerned with the future of Northwest Arkansas, and Washington County in particular.

Our area is growing quickly and we are concerned about the water, aviation, highways and sewer systems being able to facilitate this growth.

Washington County is filled with many scenic rivers, streams and lakes nestled up against some of the steepest hills in the state. Our annual precipitation is about 48", which mostly comes in the form of rain. When these showers occur, run off is sudden and severe and in many cases will cause flash floods. This sudden run off causes several problems to the water quality of these lakes and streams.

Confined livestock operations, especially in the poultry arena, is expanding very rapidly. This situation is a "catch 22" in that we like the industry and the progress it brings, but it also produces enormous amounts of chicken litter with no or inadequate facilities to store and utilize this resource.

We, the Washington County Soil and Water Conservation District, want to go on record as saying that we support the water quality efforts of the Soil Conservation Service, Agricultural Stabilization and Conservation Service, the Army Corps of Engineers, the University of Arkansas, the Cooperative Extension Service and the Arkansas Soil and Water Conservation Commission. We also support the Clean Lakes Program on Beaver Lake, the Hydrologic Unit Project in the Moore's Creek area and the ACP Water Quality Special Project that has been proposed for the Illinois River Basin. We feel that these programs will greatly benefit water quality in our precious rivers, streams and lakes.

STATEMENT OF DELFORD RIEFF (cont.)

We are also concerned with the highways, sewer systems and aviation aspects of our area as well. We feel well maintained highways will be a major role in inviting more industry to the area. Our sewer systems are in need of upgrading and waste water treatment facilities are desperately needed to keep from damaging the environment. In order to attract more industry the need for good airports and adequate flight service will also be a big key.

We would like to thank you for hearing us out, but we also want you to know that we are very concerned about the water quality of Northwest Arkansas. Water must be your number one priority. Without good clean water, livestock, industry, and the people of Northwest Arkansas are destined for a gloomy future.

Sincerely,

Delford Rieff
Board Chairman

TO EXAMINE THE FUTURE OF OUR NATION'S INFRASTRUCTURE NEEDS

MONDAY, SEPTEMBER 17, 1990

House of Representatives,
Committee on Public Works and Transportation,
Munster, IN.

The committee met, pursuant to call, at 11:20 a.m., in the main conference room, Munster Town Hall, 1005 Ridge Road, Munster, IN, Hon. Glenn M. Anderson (chairman of the committee) presiding.

Present: Representatives Anderson and Visclosky.

The Chairman. The meeting of the Committee on Public Works and Transportation will come to order.

I was going to make an opening statement, but because someone is in kind of a tough time schedule, we will proceed to our next witness, our colleague in the House of Representatives, the Honorable Jim Jontz, who represents Indiana's 5th District. I understand part of Jim's district abuts Pete's 1st District and that while the 5th District is more rural than urban, there are some common interests and needs, particularly with regard to mass transit and commuter rail.

Jim, I know you are constantly working hard in the best interests for your district and your constituents. We are delighted that you could appear at our hearing and we look forward to your testimony. I will save my opening remarks until afterwards because I understand you have to "hit and run".

The floor is yours, Jim.

TESTIMONY OF HON. JIM JONTZ, A REPRESENTATIVE IN CONGRESS FROM INDIANA

Mr. Jontz. Thank you very much, Mr. Chairman. I don't believe I have ever seen a committee get started so quickly.

Mr. Chairman, we really appreciate your coming to Indiana. You will hear some outstanding testimony today from our Governor and from local officials. I believe that the local political leadership in our State and our region wants to deal with the transportation problems that we face, and we appreciate your coming here today because it will take cooperation between Federal, State and local governments to effectively meet the transportation needs of the future.

This part of the country, like other parts of the country, is facing demographic changes. We are very fortunate that we've had people move into some of the suburban areas of Lake County and Porter

County. Many of these individuals are moving into my district and many are moving into Peter's district. But with the additional population, of course, comes transportation problems. Highway 41, Highway 30, the Borman, these roads were just not designed for the volume of traffic that they are now handling. So if this area is to continue to grow, we have to address these transportation problems.

Mr. Chairman, the message I want to leave with you today, to be very brief, is we hope that the Surface Transportation Act, which will be reauthorized by your committee in the near future, will recognize the need for dealing with highway congestion, with the need for mass transit, and the need for intermodal transportation. I want to take just a brief minute to share with you one of the challenges that we face here in the region as an example of the sort of problem I hope the committee is aware of.

One of the exciting ideas which has been initiated locally to address this problem of congestion is the idea of commuter rail service in west Lake County. This service would go from the town of Lowell in my district up to Cedar Lake, St. Johns, to Dyer, and then to Chicago. This would help a great deal in meeting the needs for transportation for individuals who live in Indiana and work in Chicago. It would help with the congestion to a great extent that we face on our highway system.

We appreciate the enormous task of getting commuter rail started. The testimony I have outlined for you today explains what is being done on the local level and the sort of help that we need from Washington, and in particular talks about the problem of right-of-ways and how the preservation of right-of-ways, to put it in a positive way, is so critical to initiating these sorts of projects.

I have a lot of confidence that the West Lake corridor project will be a success. Our State legislature in the next session will be looking at ways to provide the local financial assistance is needed. If we can protect the right-of-way and get some reasonable Federal help, I think the local government and the State of Indiana recognize the value of this service and want to provide rail service in west Lake County to help address our problems.

You are going to be hearing about the other problems that we have in our region, too. I won't burden you with discussion of any other issues but simply conclude by saying thank you for coming to Indiana. We know your committee has an immense task ahead of you, and I wish you the best. I want to work with you, with my colleague, Peter Visclosky from northwest Indiana, to do anything we can to help address our region's transportation needs and the Nation's transportation needs.

Thank you, Mr. Chairman.

[The prepared statement of Hon. Jim Jontz follows:]

Testimony of

REPRESENTATIVE JIM JONTZ
FIFTH DISTRICT, INDIANA

Before the

HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SEPTEMBER 17, 1990

Mr. Chairman and members of the committee, I thank you for conducting this hearing and for the opportunity to testify. The Public Works and Transportation Committee should be commended for its willingness to conduct hearings across the country on the infrastructure needs of regions and municipalities, in preparation for reauthorization of the Surface Transportation Act. I want to thank my colleague Peter Visclosky for his efforts to bring the committee to Northwest Indiana.

The people of Northwest Indiana are facing many of the same problems that citizens of other urban and suburban regions across the country face -- highway congestion, lack of sufficient mass transit, and the absence of an intermodal transportation plan.

But we in Northwest Indiana are fortunate to have several public and private agencies working to solve these problems, and with proper federal assistance, we can remedy these conditions.

Mr. Chairman, I would like to briefly acquaint the committee with two projects which address the problems we face here in Northwest Indiana and outline how the federal government could be of help.

WestLake Corridor Project

In the past decade Lake County, Indiana, has undergone significant dramatic demographic change as thousands of new residents have moved into its suburban townships. Many of these individuals work at white-collar or professional jobs in or around Chicago but find Indiana an attractive place to live. Recent studies have indicated that as many as half the single family home sales in areas of Lake County bordering Illinois are to former Illinois residents.

This growth is not unwelcome but of course is accompanied by various infrastructure problems. In particular, Northwest Indiana's highways are now intolerably congested and getting worse, as more and more commuters make their daily trip into Chicago. The demand for commuter services is growing. The South Shore line is experiencing significant overcrowding conditions on all its rush hour trains, and the Hammond Yellow Coach commuter bus service has increased its 1980 ridership by several hundred percent.

In response to this need, the Northwestern Indiana Regional Planning Commission conducted a study of the commuter options available in northwest Indiana and concluded that "the options of commuter bus and commuter rail are ideally suited to solving the mobility problems within the west Lake County area. Their cost is far lower than other options studied, they have the capacity to transport thousands of riders to and from downtown Chicago, and have the greatest real potential for fostering economic development."

The most promising proposal developed by the local planning organizations is one for a commuter rail service starting at Lowell in south Lake County, and proceeding through Cedar Lake, St. John, Dyer, Munster, Hammond, and into Chicago. This route would be primarily over CSX trackage. I believe this proposal is an excellent one, Mr. Chairman, but faces many difficulties, not the least of which is the preservation of rights-of-way.

Northwest Indiana, like many similar regions, once had an effective system of intercity passenger rail service as well as an extensive freight rail network. Over the years, as elsewhere, the passenger service has disappeared and much of the freight network has been abandoned. Until recently, many of these rights-of-way have remained intact, but today these rights-of-way are disappearing into residential and commercial development with little thought to their possible future utility.

Fifteen years ago during our first energy crisis, many people recognized that rail was an important mode of energy efficient transportation for both people and freight and that a revitalized rail transportation system would necessarily play a role in America's efforts for energy conservation and independence. Since 1980, however, that recognition has slipped from view until the recent events in Kuwait brought it back into sharp contrast.

An important factor in the cost of rebuilding a rail transportation system in this country will be the costs of right-of-way acquisition. That cost will be increased enormously if entities trying to develop mass transportation systems have to repurchase former rights-of-way which have been lost or force new rights-of-way through already developed areas.

In the case of the WestLake Corridor project, much of the necessary right-of-way is still in active use; however, one short but vital section of track owned by CSX Railroad is presently the subject of an abandonment petition before the ICC. If this section were to be lost, the WestLake Corridor project could be jeopardized or become prohibitively expensive. Like the WestLake Corridor, as existing or former rights-of-way become more scarce, the options available for communities trying to rebuild mass commuter transit will begin to disappear. Mr. Chairman, I believe it makes undeniable fiscal sense for us to find mechanisms by which municipalities and other local authorities can afford to protect existing rights-of-way if there is a future prospect of using them for mass transit.

Valparaiso Amtrak Service

Another local problem which points up the need for a reinvigorated mass transit program in the upcoming surface transportation reauthorization bill is that faced by the commuters who now ride Amtrak's "Calumet" service from Valparaiso, Indiana, to Chicago.

Valparaiso is located about 40 miles southeast of Chicago in Porter County, Indiana. There is now one commuter train servicing this route daily, but that service is threatened with termination by Amtrak at year's end. There were two trains servicing this route until 1986, but Amtrak has managed to reduce ridership on this line to an all time low during a period of burgeoning demand for commuter service in Porter County as evidenced by the overcrowding of the competing South Shore service. It is obvious to area observers that the deterioration in the Calumet's ridership has not been due to market conditions but, rather, to Amtrak's disinterest in maintaining the service.

Prior to the discontinuance of the second train, the Chicago - Valparaiso route's average yearly ridership was 227,800. Immediately afterward the ridership dropped to 137,185. Amtrak's one way fare for the trip is $7.75 compared to the South Shore's $4.75 fare. Monthly fares show a similar difference. Amtrak's policies seem intended to discourage rather than encourage ridership.

Since Amtrak first indicated that continued service was threatened, local and state authorities have been working hard to find alternatives which would maintain the service. Every overture made by the State of Indiana has been rebuffed by Amtrak. I believe that by now everyone is convinced that the continued operation of the Calumet by Amtrak is not in anyone's interest and the only viable alternative is to find another operator willing to take over the service. The obvious choice is the Northern Indiana Commuter Transportation District (NICTD), which successfully operates the South Shore.

Such a transition would of necessity entail finding a local source of revenue to complement what federal funding would be available, and local and state elected officials have made remarkable progress developing a proposal for next year's General Assembly; however, Amtrak is again being recalcitrant. Congressman Visclosky and I have recently written to Amtrak asking for the Calumet service to be continued into 1991 in order to provide the General Assembly time to act on the local proposal. Amtrak refused.

Again, Mr. Chairman, I think that our local experience with the Valparaiso commuter service illustrates the kind of problems local authorities face when trying to establish or save important mass transit services. The role of the federal government should be to encourage rather than impede the development of commuter services from the standpoint of both environmental and energy conservation policy.

Allocation Formulas

One final point I would call to the committee's attention is the composition of the allocation formulas which will be developed to administer highway programs through the Surface Transportation Act.

Indiana is the "Crossroads of America." We have approximately 91,000 miles of roadways within our borders, and have more miles of interstate highway than any other state our size. Four interstate highways converge on Indianapolis, and we have 2 major east-west arteries in the northwest -- the Indiana Toll Road and I-94.

Ten percent of Indiana's highways are congested, and InDOT estimates that travel on Hoosier highways will increase by 50 percent by the year 2000, creating additional transportation challenges for our state.

Heavy commercial truck travel is a feature of many regions in the country which are experiencing infrastructure problems. Northwest Indiana and the entire state rely on truck travel for many economic and commercial activities, and due to our geographic situation, the highway system provides service for intense interstate truck travel.

I would request that the committee consider allocation formulas which recognize the needs and characteristics of regions such as ours. InDOT recommends an allocation system which gives weight to truck travel. Diesel fuel use data reflects truck travel, and its inclusion in formulas would benefit the region and state.

Other components of a funding formula which InDOT recommends are total statewide urban and rural lane miles, and total statewide urban and rural vehicle miles traveled. States our size with significant interstate mileage have great needs, which these proposals reflect. I endorse InDOT's formula recommendations.

Mr. Chairman, I again appreciate the opportunity to testify and to present the concerns of the people of this region to you. I'm confident that the committee, under your leadership, will develop reauthorization legislation which will address the needs of regions such as Northwest Indiana. Thank you.

The **Chairman**. Thank you, Jim. It was an excellent statement.

I have one question I would like to ask. You may have partly answered it already. As the Committee puts together a national infrastructure bill, and as the Highway Bill is developed this coming year—and we had a hearing on that today, too, and I just left it—what is it that we can do to help the people of Indiana's 5th and 1st Districts? What specifically?

Mr. **Jontz**. Well, I think the special attention that can be given to areas of rapid growth to meet the congestion problems that I have outlined, particularly through mass transit, and help us get this rail system up and going, that's the most critical problem that I see in this part of my district. I'm sure that Peter Visclosky, my neighbor here in the 1st District, will be speaking to that problem. We feel, with a helping hand from the Federal Government, that this service can become a reality.

The **Chairman**. Do you have something to add, Pete?

Mr. **Visclosky**. Mr. Chairman, only to wish Jim well in catching his flight.

Mr. **Jontz**. I'll see you in Washington later today.

The **Chairman**. Thank you, Jim, very much.

With that, I think I will try my opening statement. The Committee on Public Works and Transportation hearing today is on the future of our Nation's infrastructure. This is what it's all about.

We will be hearing testimony from an impressive group of witnesses, and I know this is going to be an extremely productive hearing. I want to thank everyone for taking time from busy schedules to share with us your concerns, knowledge and perspectives about this important issue.

It is a great pleasure to be here in Pete Visclosky's district, and I want to thank him and the people of Indiana's 1st District for welcoming us here today and for making this hearing possible.

I must compliment the citizens of the area for sending Pete to the Congress. I have known Pete for almost six years as a member of this Committee. During that time, he has impressed me as a very intelligent and hard-working Member of Congress. Because I have had the pleasure of working with Pete over the past years, I wasn't surprised to read that he had been named one of the smartest Members of Congress.

Pete has not been shy about expressing his feelings on national transportation policy and the particular infrastructure needs of northwest Indiana. He has made it very clear to the Committee that because his district is at America's crossroads, transportation and infrastructure are its economic bread and butter.

Pete's hard work and legislative persistence have paid off for northwest Indiana. In 1986, he included the Little Calumet flood control project in the Water Resources Act. His successful appropriations efforts have resulted in this years groundbreaking on the project. In this Congress, Pete won approval for a $28 million Federal building that will increase the efficiency of many Government services. As many of you know, Pete is a very vocal advocate for locating the area's third major airport in Gary. On the way here from the airport, Pete expressed to me his vision of a comprehensive and coordinated mass transit system for northwest Indiana to continue the area's economic growth.

I am pleased that Pete has brought the Public Works and Transportation Committee to northwest Indiana. I am sure that what we will hear today will provide the Congress with invaluable information on the area's transportation needs.

This year our Committee has been examining many aspects of the infrastructure issue, seeking a better understanding about our Nation's public works crisis. We have explored emerging infrastructure needs from the national perspective and reviewed the impact of infrastructure on private investment and on the ability to compete in international markets. We also plan to look at infrastructure financing alternatives and new technologies.

It is important, however, that we understand the kinds of infrastructure problems that are being experienced at the local levels, so we have embarked on a series of hearings at various sites around the Nation to talk with you, the people most directly involved with our infrastructure.

Let me tell you why our infrastructure is a national priority. The answer is our economy. The United States—and this is shocking to me—ranks 55th in the world in capital investment. The country of Japan spends five times more than we do on infrastructure. And the little country of West Germany's annual productivity rate is three times ours.

Infrastructure is not just potholes; it is productivity. Infrastructure is not only concrete; it is competitiveness. Yet, what we see today is a system of peril, not pride.

Sixty percent of the highways of our country and 41 percent of our bridges are in need of work. Many of the bridges are unsafe. Traffic congestion has increased over 50 percent in the last ten years. In our Nation's largest urban areas, two billion hours of time are lost annually. If you're delayed 20 minutes each day in rush hour, by the end of your career you will have wasted two working years.

By the year 2000, traffic delays caused by inadequate roads will cost us $50 billion in lost wages and wasted gasoline.

No new airport has been built in this country since 1974. Many of our urban water systems are over 100 years old and lose as much water as they move.

Countless jobs are being lost, and according to the Rebuild America Coalition, in Indiana alone, 15 percent of all paved rural highways and 9 percent of urban highways and streets are considered deficient, as well as 28 percent of the highway bridges on the Federal aid system, and 47 percent of the bridges on state and local roads.

It is not just highways and bridges, and it is not just Indiana. This is a national problem of alarming dimensions.

Because of this, we are looking to you to help us gain further insight into our infrastructure needs. The question today is, what is the condition of the infrastructure in Indiana, particularly this area of the State. Are your roads, bridges, public buildings, sewers and wastewater treatment plants, water supply facilities and other basic services adequate to meet current and anticipated needs of the area? If not, what can be done and by whom? We look forward to today's hearing to answer these and other questions.

Now I would like to recognize Congressman Pete Visclosky for any remarks that he might wish to make.

Mr. VISCLOSKY. Mr. Chairman, thank you very much.

First of all, on behalf of the citizens of northwest Indiana, I want to welcome you to our State and region. Secondly, I want to thank you very much for the time and effort that you have taken to be with us today. I recognize that you have already had a long day that started with a hearing in the State of Pennsylvania somewhat earlier today.

But secondly, I would point out to those in the audience that we do have the Public Works and Transportation Committee of the House of Representatives here because we have their Chairman, Glenn Anderson. Glenn Anderson is the appropriate person to be here today because he has been a legislator and an executive at the local and State level prior to his assuming his office in the United States Congress. The fact is, he was a member of a city council in Hawthorne, CA as well as its mayor. He was not only a member of the California General Assembly, but he was the State's Lieutenant Governor for eight years. So clearly, from the local perspective that we're concerned about here today, as well as the State's perspective, both as a legislator as well as an executive, he clearly understands from his background, our concerns.

He is the Chairman of the full Committee. Some call him a liberal because of his concern about the plight of people in the United States of America. Others accuse him on occasion of being conservative because of his desire to ensure that we do have a balanced budget and that we do marshal the resources of the United States in a progressive fashion. It is my pleasure to welcome the Chairman here.

He is not here simply to hear testimony. It was a point of the Chairman to ensure that he did not fly into an airport in another State or to another area but, rather, that he fly into the Gary airport. Having done so, he spent some time on the Cline Avenue Expressway, which in the past congresses, he has been instrumental in helping me and our area. Ultimately, as all of us today I think at one time or another, have spent some time on the Borman Expressway. So the fact is that while time is short, the Chairman, as a quick study, wanted to ensure that he saw some of the basic infrastructure situations we are confronted with in northwest Indiana.

Secondly, he does want to hear about the area and about the State. As a Member from California who flies over our area potentially four to six times a month, if not more, in his duties, he wanted to talk to the people of our area about what is occurring in it. And finally, he is not here simply to hear testimony but to see and meet the people, not only people such as Congressman Jontz, but our Governor, Evan Bayh, who he has personally met with on other occasions, and citizens in the public and private communities in our area.

From my perspective, I think this hearing is important in two respects. First, it gives many people who otherwise would not be given the opportunity to travel to Washington to testify before the committee an opportunity to be heard. But, more importantly, it also lets the Chairman know that we are, in northwest Indiana, and the State of Indiana, willing to do more in terms of helping ourselves and matching Federal programs, but that in the end we can't do it by ourselves. We do need that strong Federal commitment.

If I could echo a portion of Congressman Jontz' presentation, while we have many needs—the Gary airport, for example, our many highway projects—we are in the midst of a local development in terms of mass transit; that is, the continuation of the Amtrak line running from Valparaiso to Chicago, but more importantly, the development of the West Lake line and the coordination and consolidation of those two lines with the existing South Shore service so that we continue at least one of our several positive trends in northwest Indiana, and that is, the movement of people into our area.

I think many might be surprised—but they should not be—to learn that the Hammond-Gary SMSA is one of only eight areas in the United States of America today that is in a positive trend in terms of its real estate market. I think many of us appreciate why—housing affordability and the tax structure of our State. What we don't want to do is to miss the boat and cut off a positive trend by not seriously addressing the transportation needs we have in our area, particularly those in the mass transit area.

With that, Mr. Chairman, again I want to warmly welcome you to our area and thank you for your strong commitment in terms of a national policy and your willingness to visit our area.

Thank you.

STATEMENT OF CONGRESSMAN PETER J. VISCLOSKY

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

FIELD HEARING/MUNSTER, INDIANA

SEPTEMBER 17, 1990

I would like to thank Chairman Anderson and the Public Works and Transportation Committee for holding this hearing in Northwest Indiana. Welcome to the Crossroads of America.

Chairman Anderson is a highly respected member of Congress from California. His political career started as mayor of his hometown Hawthorne. He then worked his way through California's state government where he eventually served as Lieutenant Governor. Chairman Anderson was first elected to the House of Representatives in 1968 and has proven to be a credit to the Congress and the nation. He has consistently worked for better transportation systems, a cleaner environment, and effective methods of assisting the elderly. Again, I thank Chairman Anderson for bringing the committee to Northwest Indiana.

Northwest Indiana faces many of the same transportation and infrastructure problems that confront the established areas in the Midwest and Northeast United States. Because Northwest Indiana is at America's crossroads, the transportation problems that are common across the United States take on a greater significance here at home. Not only does Northwest Indiana's transportation infrastructure determine the quality of life for the people who call the area home, but the efficient free-flow of commerce across the United States is dependent upon an unfettered passage through our area. Simply put, the systems of roads, bridges, and mass transit in Northwest Indiana impact the economy of both our area and the nation.

Our roads and bridges are crumbling. The Borman Expressway, America's east-west Main Street, faces consistent and debilitating over-congestion. Meanwhile, the Indiana Toll Road/Chicago Skyway is grossly underutilized. These are just two glaring examples of our area's highway problems. I would ask that the committee place special emphasis on the Borman and Indiana Toll Road/Chicago Skyway during next year's reauthorization of the surface transportation bill.

Our mass transit systems are also in great need of development and coordination. The Valparaiso-to- Chicago Calumet commuter line operated by Amtrak brings our area's residents to and from Chicago each working day. On an annual basis, an estimated 132,000 riders board the Calumet and return $8 to $10 million in income back to Northwest Indiana. It is imperative that we keep the Calumet on track.

The benefits of continued and service by the Calumet will allow the train service to be coordinated with the South Shore passenger line and the proposed development of the West Lake Corridor line. The South Shore rail line runs along the border of Lake Michigan to Chicago. During rush hour, its service is stretched to capacity. The line is greatly in need of additional cars and coordination with other mass transit services to continue its growth and effectiveness. The development and coordination of these three lines will be an immeasurable boost to Northwest Indiana's economy.

Although the location of the area's third major airport is not necessarily germane to the topic of today's hearing, I feel compelled to make a brief mention of its importance to our region. Approximately six years ago, Indiana, Illinois, and Wisconsin developed the "Tri-State Commission" to determine the site for the area's third metropolitan airport. The process progressed, narrowing to two states and four potential sites - one in Gary, Indiana and three in Illinois. The City of Chicago then used its considerable financial and political clout to bull its Lake Calumet site into the process. Mr. Chairman, I firmly believe that Gary, Indiana is best suited to be home to the area's third major airport.

The recession of the early eighties was especially hard on Northwest Indiana's economy. The steel industry alone lost 30,000 jobs. Now that the area's economy has stabilized and is once again growing we must do all we can to encourage continued prosperity. The movement of people from Illinois and other states has a direct impact on our economy. While these people may work elsewhere, they bring their paychecks home to Indiana.

Our area may not have a direct effect on key economic determinants such as the price of crude oil or interest rates but we can control our own economic destiny by making Northwest Indiana an attractive place to live. Aside from relatively lower taxes, housing prices, and development of the lakeshore -- easy access to and from Chicago will guarantee continued movement to Indiana and continued economic growth.

At a time when the world is confronted with a military crisis in the Middle East and economic competition becomes increasingly global in nature, the United States cannot afford to be without a national transportation policy that maximizes efficiency and reduces energy consumption. It is my expectation that the Congress will take steps to address these problem next year when the surface transportation act is reauthorized.

I would like to thank our distinguished panelists for participating in today's hearing and I look forward to to their testimony. I would also request that in the interest of time, each panelist limit their opening statement to five minutes, allowing time for questions and answers. Each panelists will be allowed to submit their entire statement for the record. I am confident that today's witnesses will relay to the committee the particular needs and concerns of Northwest Indiana as it crafts the surface transportation reauthorization measure.

The CHAIRMAN. Thank you, Pete.

Now, because of the number of people willing to participate in this hearing, and because of the time constraints, I am going to ask witnesses to summarize their statements orally in three to five minutes, if possible. Each witness' full statement will be printed in its entirety in the hearing record.

I am very pleased to welcome the distinguished Governor of Indiana, the Honorable Evan Bayh. Governor, I want to commend you for your efforts on behalf of the Build Indiana fund. As I understand it, the purpose of the fund is to finance projects that will enhance economic growth and development in Indiana and provide for a better quality of life for all Hoosiers. Now, I know also that you champion the position that the third major airport in the Chicago metropolitan area should actually be located in Gary, IN.

We are honored that you could take the time from your business schedule to join us, and we look forward to hearing from you today. You may begin when you're ready.

TESTIMONY OF HON. EVAN BAYH, GOVERNOR OF INDIANA

Governor BAYH. Thank you very much, Mr. Chairman. I would like to join with Congressman Visclosky and all those of us here today in welcoming you to the State of Indiana. We pride ourselves on Hoosier hospitality and we are very, very grateful for the opportunity to extend that to you today. I am delighted to know that Pete had an opportunity to show not only our airport to you but other major aspects of our local infrastructure. That is very, very important.

I would like to just at the beginning here, Congressman Visclosky, share with you and the audience a story that I haven't had a chance to share with you before. As you are aware, I met with Chairman Anderson earlier this year on some of the infrastructure needs confronting the State of Indiana, and in the course of our meeting it became clear that my mother-in-law, Susan's mother Carol, is actually a constituent of the committee Chairman. Well, we talked about that a little bit and I didn't think much more about it. And lo and behold, two days later I got a very excited phone call from one very happy mother-in-law who had just been called personally by her local Congressman. So I think that demonstrates very clearly the kind of constituent service provided by the Congressman and the dedication that he brings to his job. Congressman, I am personally grateful to you.

The CHAIRMAN. Governors are very important, but there's one thing probably more important than a Governor, and that's a constituent.

Governor BAYH. You're right about that, Mr. Chairman. I can easily see the secret to your——

The CHAIRMAN. They vote. They vote.

Governor BAYH. Well, constituents and mothers-in-law are also important, so I am personally grateful to you. I wanted to point that out here today.

I would also state, at the risk of stating the obvious, we're very proud of our many natural resources in the State of Indiana. Foremost among them are our people. Foremost among those natural resources I would place Congressman Pete Visclosky. He has worked very, very diligently on behalf of the citizens of northwest Indiana, and I have been personally grateful for the support that he has brought to many of the projects—indeed, all of the projects I will be mentioning here this morning. So, Congressman Visclosky, we're grateful to you, along with Chairman Anderson, for bringing the committee to us here today to hear first hand about the needs of northwest Indiana. I want to publicly thank you for your leadership in the area of infrastructure and transportation on behalf of the citizens of our State. We're grateful to you.

Mr. Chairman, I have submitted written testimony. I will summarize my comments, trying as best I can to meet the three to five minute time limitation, and then I would be happy to respond to any questions that you might have.

I think it is very appropriate that the committee has chosen northwest Indiana as the venue for this meeting. Northwest Indiana presents our State with some of its greatest challenges, and also its greatest opportunities, in the area of transportation infrastructure. Your comments were right on target. Northwest Indiana is a perfect example of how transportation, both surface transportation, rail, ports, airports, the development capacity, have all contributed to the growth of economic opportunity and the creation of quality jobs for the citizens of our State.

You are also right on target when you say the infrastructure investment is directly related to international competitiveness. I think it is vitally important that we continue the partnership at the Federal, State and local levels to increase our Nation's and out State's investment in infrastructure improvements because that means quality job opportunities for the citizens of our State, and particularly in a vibrant and growing area like northwest Indiana. So I want to thank you for meeting here today. I think it is very, very important.

I would like to just touch upon a couple of the highlights of the challenges and opportunities that confront our State here in northwest Indiana. The Borman Expressway, which you had an opportunity to travel on personally earlier today, is the busiest in the State of Indiana, handling well over 135,000 vehicles per day, and it has one of the highest concentrations of heavy truck traffic to be found anywhere in the United States of America. And you're well aware of what that means as far as pavement serviceability.

The State has responded to these challenges, along with Federal assistance, by expediting our efforts to improve the Borman's capacity to handle this traffic. In particular, four interchanges have been expedited, tens of millions of State dollars have been spent. Alternatives to the Borman to relieve some congestion, particularly a southern expressway, have been considered. We, along with the Federal Government, are studying the possibility of lifting the tolls on the Chicago Skyway and the Indiana Toll Road as an incentive to relieve congestion on the Borman. It is a vital transportation link, and the State and local authorities have emphasized it. We are grateful to the Federal Government, to you and Congressman Visclosky, for the help you have given us in this regard, and we intend to continue to do all that we can to improve this vital transportation link.

Probably the greatest economic development project in the entire history of the Midwest relates to a transportation development here in northwest Indiana, specifically the potential for siting the third Chicago regional airport in the City of Gary, on the site of the existing Gary Airport into which you flew earlier today.

Without getting into all the technicalities, because many of those are currently under study, let me say I would like to take this opportunity to ask this committee to use your good offices to see that the decision is made on the basis of the merits and not on the basis of parochial and political considerations, because I'm convinced if the siting decision for that airport is made upon the basis of the merits—the convenience of the traveling public, the number of jobs to be created and so forth—that the ultimate site for that airport will be in the City of Gary at the airport you flew into earlier today.

Amtrak, as has previously been mentioned, particularly the Calumet Line between Valparaiso and the City of Chicago, we have at the State level awarded NICTD, the Northern Indiana Commuter Transportation District, $80,000 for a feasibility study, that is not yet fully completed, to determine whether, through a combination of local and State support, that line can be maintained. I would urge this committee to use your good offices once again to extend the deadline through June 30 of next year to give the local authorities an opportunity to assess the feasibility of local support for this line, to preserve what is a very, very important rail piece of transportation infrastructure for our community.

Likewise, with the South Shore Railway, we at the State level have, for the first time in the history of the State of Indiana, provided an $800,000 discretionary grant for a rail program, the South Shore Railway, a vital link between the Greater Chicago Metropolitan Area and northwest Indiana. We have committed to supplying $4.5 million for new cars for the South Shore Railway, which we hope will improve both the quality and the efficiency of their service. We are currently negotiating with UMTA at the national level for an additional $38 million to support this vital rail link.

I am convinced that the South Shore is one of those key areas that Congressman Visclosky mentioned that allows our population to grow and jobs to be created in northwest Indiana. We look forward to maintaining the strong Federal, State and local commitment to maintaining that vital link.

The Port of Indiana, one of our bits of transportation infrastructure you will not get to visit today, is one of our three premier ports in the State of Indiana. It is vital and growing, and it handles international cargo from the St. Lawrence Seaway and the Great Lakes. It has recently been the site of the construction of a new steel mill, and it is a part of our infrastructure and a key element for economic progress in northwest Indiana.

Finally, Mr. Chairman, let me mention several things. We meet in northwest Indiana, but there are several other projects that are very, very important to the well-being of all 5.5 million Hoosiers. Particularly there is the Hoosier Heartland Corridor linking the City of Lafayette with the City of Fort Wayne. It runs directly through Congressman Jontz' district. He has petitioned me often on its behalf. I am sure, if he did not have an opportunity to mention it earlier today, he would wish for me to do so. It is vitally important. Also, the Evansville to Indianapolis Expressway. It's an important part of the national transportation network that was excluded from the original interstate highway construction system. We hope to have that included at some level of Federal support in the Highway Reauthorization Act or future Federal initiatives to complete and fill out the national interstate highway system. It's vitally important to an entire quadrant of our State.
